improvements, near White Plains. July 15 to
Sept. 7. References. Address 7,755, Outlook.

"I Always Recommend 3-in-One"

because electrical devices run so fast that only the finest oil will lubricate them properly. The little you save on 'cheap' oil is more than off-set by repair bills. 3-in-One keeps the repair man away."

3-in-One
The Universal Household Oil

is so satisfactory for these electrically operated devices because

- it won't heat up or burn out at high speeds.
- it won't dry out and leave the bearings unlubricated.
- it won't become gummy or collect dust.
- you can't over-oil with 3-in-One. Excess oil simply runs out instead of clogging the bearings.

And 3-in-One keeps all metal parts free from rust and tarnish.

Oil all electrical devices according to the speed at which they run—very high speed, oil every time you use—low speed, less frequently.

3-in-One is sold at all good stores in 1-oz., 3-oz. and 8-oz. bottles and in 3-oz. Handy Oil Cans.

LET me care for your children during summer. Excellent references. 306 South Lyon, Mich.

BY THE WAY

THE word "chapel" is used by printers to denote the body of journeymen employed in a composing-room. This special use of the word is apparently unknown in some other trades. Recently a contribution from The Outlook's composing-room was sent by the chairman of its chapel to workers in another line who needed assistance. The contribution was gratefully acknowledged in a letter addressed thus: "The Rev. George Wright, The Outlook Chapel, New York City."

A Baptist minister who practiced immersion was asked, according to "Judge," to tell what was his most awkward experience. He said: "One Sunday afternoon I was to have an immersion in the river on the outskirts of town. A great crowd had assembled. There were two candidates for baptism. One was an extraordinarily tall woman, coming almost up to my own six-feet-three in height. The other was a little runt of a man hardly five feet tall. When it came time for the ceremony I took the towering lady by the arm, intending to immerse her first, and told the little man to follow us. The lady and I had gone into the water until it was about up to our waists, when I heard very improper tittering among the spectators. Looking back to discover the cause of this untimely levity, I beheld the little candidate for baptism coming along—swimming!"

"When, years ago," says Dr. G. Stanley Hall in the "Atlantic," "I first heard the picturesque word 'Flapper' applied to a girl, I thought of a loose sail flapping in whatever wind may blow, and liable to upset the craft it is meant to impel. There was also in my mind the flitting and yet cruder mental imagery of a wash, just hung out to dry in the light and breeze, before it is starched and ironed for use. I was a little ashamed of this when the dictionary set me right by defining the word as a fledgling, yet in the nest, and vainly attempting to fly while its wings have only pinfeathers; and I recognized that thus the genius of 'slanguage' had made the squab the symbol of budding girlhood."

Specialization in the shoe trade is indicated by this sign over the front of a New York City store: "Shoes for Boys, Youths, and Little Gents."

Few people realize the vast extent of the Dutch empire in the East. The Netherlands, the home country, is only about 13,000 square miles in area, and trains go from its eastern to its western boundary in a few hours. But the journey by sea from Sabang, north of Sumatra, to Merauke in New Guinea—the extreme limits of Holland's island empire—covers about 3,000 nautical miles, or more than the distance from the United States to England. The total area is about 735,000 square miles. One of the islands, Java, about as large as New York State, contains a population

Low Fares to the Greatest of Outdoor Lands

The Puget Sound Country can now be visited at remarkably low cost.

It's your chance to see this land of big distances—of inspiring mountain views—lakes and glaciers—primeval forests—snow-capped peaks—sheltered harbors—ocean beaches. Mt. Rainier National Park, the Olympic Peninsula, Puget Sound, the Pacific Ocean and the big timbers are but few of the attractions of this most diversified vacation region.

En route travel over the World's Longest Electrified Railroad. Unsurpassed mountain scenery! Open observation cars! No smoke or cinders. The famous "Olympian" and the "Columbian" between Chicago and the Pacific Northwest are electrically operated for 649 miles.

You can return through California at slight additional cost. Choice of routes.

BY THE WAY—(Continued)

of 34,000,000—three or four times as great as that of our Empire State.

Here is a clever indictment of our lingual inconsistencies, headed in a contemporary's column as "The Same Old Slam on Our Language:"

When the English tongue we speak
Why is break not rhymed with freak?
Will you tell me why it's true
We say sew but likewise few,
And the maker of a verse
Cannot cap his horse with worse?
Beard sounds not the same as heard;
Cord is different from word;
Cow is cow, but low is low;
Shoe is never rhymed with foe.
Think of hose and dose and lose,
And of goose and yet of choose.
Think of comb and tomb and bomb,
Doll and roll and home and some.
And since pay is rhymed with say,
Why not paid with said, I pray?
We have blood and food and good,
Mould is not pronounced like could.
Wherefore done and gone and lone?
Is there any reason known?
And, in short, it seems to me
Sound and letters disagree.

An incident that Sir Ernest Shackleton always repeated with glee was the reply one of the Irish members made to him when Shackleton asked: "Can you imagine the enormous extent of those vast Arctic snow fields?" "Yes," replied the Irish member, "I had the same sensation the first toime I appeared in public wearing a dress shirt."

"Some of the neighbors are making a howl about the items we are sending in," says a contributor of local news items to the Columbus (Montana) "News." "So I believe that as soon as my supply of stationery runs out, I will quit writing. Let some one else take the job if they think they can do so much better. I am getting tired of being bawled out every week, and would like to sit back and criticise some one else writing for a while."

To this the Editor, not wishing to lose an able writer, brackets a comforting and finely independent reply:

"Stay with 'em, kid! Don't let the jabbering of a few kickers unveil the cayuse in your disposition. If an editor or writer takes the scare that easy, we would have swapped our pen for a Fatima ten years ago, and each and every issue since then. If our patrons don't like what you and I write, let them stop taking the darned News, and then they will surely have no kick coming."

From "Punch:" Boy at car window (to father, seeing him off to school)—
"If you like, daddy, I'll introduce you to Binks's father. He's the sort of man it might be rather useful for you to know."

From "Judge:"

Between an optimist and a pessimist
The difference is not so strange;
The optimist smiles at the cashier girl,
The pessimist counts the change.

To Make Old Furniture Look New— Use Valspar Enamels

PORCH furniture finished with Valspar Enamels can be freely washed—can be left out in sun and rain without losing color or lustre. Valspar Enamels are fine pigments carefully ground in durable, waterproof Valspar—the varnish that won't turn white.

You will find Valspar Enamels easy to use. They work freely under the brush, dry dust-free in two hours and hard in twenty-four.

Porch furniture needs a durable, lasting finish. Don't waste time with inferior enamels. Valspar Enamel, wherever used, including automobiles, *starts* bright and *stays* bright.

Valspar Enamels are made in 12 beautiful lasting colors, also in Black, White, Bronze, Aluminum, Gold, and Flat Black. Send for complete color chart. For sample can use coupon below.

S

WHEN IS A LAW NOT A LAW

A MAN once famous for the quality of beer which he brewed recently traveled to Europe in a vessel owned and operated by the United States Shipping Board. From the other side he sent back a pertinent query. He wanted to know why it was illegal for him to make beer, while the Government itself was in the market for German beers with which to supply its vessels. He pointed his question by inclosing a copy of a list of drinks sold by the United States Government on its own vessels—when they had passed beyond the three-mile limit. To this question Mr. Lasker replied that he had an opinion from the Attorney-General's office that it was legal to sell such liquors beyond the territorial waters of the United States.

We have not the legal erudition of the Attorney-General's office, but we confess that such a statement bewilders us. Under what selective principle is one law of the United States operative beyond the three-mile limit and another law confined only to our territorial waters? We had always supposed that a vessel was regarded as a floating section of the country whose flag it flew. If we are in error in this, how does it happen that the Congress of the United States ventures to prescribe the conditions under which American sailors shall be employed when upon the high seas? The claim of the Shipping Board to the right of exemption from the Volstead Act seems easily reducible to an absurdity.

The real reason for claiming such an exemption of course does not rest upon any principle of selective law. It is to be found in the fact that the United States Shipping Board vessels find it hard to compete for passengers with vessels of foreign countries legally entitled to sell liquor. Even if the action of the Shipping Board can be defended by a legal quibble, it is beneath the dignity of the United States Government to take advantage of it. The time to discuss the effect of prohibition upon our shipping was before, and not after, the passage of the Eighteenth Amendment. At that time we should have recognized the fact that we would have to forego the monetary advantage of selling liquor on our ships, just as we recognized the fact that we would have to forego the advantage of receiving millions from excise taxes if we were bent upon abolishing the liquor traffic. The alleged financial disadvantage of prohibiting liquor in our merchant marine is another argument

Keystone

SMITH BROOKHART

in favor of the Governmental subsidy which Mr. Lasker and the President have requested from Congress. It is not an argument in favor of Governmental hypocrisy.

THE MEANING OF BROOKHART

THE nomination of Colonel Smith W. Brookhart in the Republican primary of the State of Iowa has affected the so-called Old Guard of the party in Washington and throughout the country with greater consternation than the victory of Beveridge in Indiana or Pinchot in Pennsylvania. Brookhart belongs well over on the left wing of the more radical element of the Republican party. He wishes the Railway Transportation Act repealed and the pumping out of what he alleges to be the seven billions of water from the securities of the roads. He belongs clearly to the railway radical group. He wishes the farmers to have representation on the Federal Reserve Board in proportion to their share in the primary deposits in the banks of the country. More wisely he believes in the fullest possible co-operative programme for both farmers and factory people, and in this we think he is sound. The development of the practice of co-operation on a large scale in this country is better as a method of getting things done than the increase in Governmental agencies with their enormous overhead, waste, inefficiency, and armies of civil servants.

Brookhart favors a soldiers' bonus, to

be paid out of war profits and excess profits, and not out of a sales tax. He believes that the Newberry case should be reopened, and he is opposed to ship subsidies. He sifts out what he calls the "predatory blocs" and opposes them, but he favors the farmers' bloc, the labor bloc, the soldier bloc, the mothers' bloc, and all business blocs which co-operate with the preceding. He is eager for the retention of the direct primary as the best method of driving the "Non-Partisan League of Wall Street" from the State.

We thus recapitulate the issues through the discussion of which in the State of Iowa the nomination of Colonel Brookhart in the Republican primary was assured. There is more enthusiasm than wisdom in some parts of Colonel Brookhart's platform. But, however that may be, it is certain that the success of such a programme in the tremendously Republican State of Iowa is a warning light to the Administration at Washington which it will do well not to ignore. Kindly offices of conciliation between contending interests and factions are not enough to meet National opinion and lead it into safe and wise channels. A keen intelligence and vision and will power with respect to domestic affairs of great moment were never more needed than now in the Administration at Washington.

RADIO LEGISLATION.

CONGRESSMAN WHITE, of Maine, has introduced in the House of Representatives a bill to amend the act of 1912 which regulates radio communication. The present act, while it was adequate to meet conditions at the time it was enacted, has fallen far short of the requirements that have arisen with the marvelous development of radio during the past year. It was for the purpose of considering new conditions from every angle that Secretary Hoover, of the Department of Commerce, called, a few months ago, a conference of radio manufacturers, distributors, and others interested, and it is from the conclusions of that conference that the new bill was drawn.

It was realized that it would be quite impossible to pass statutory legislation that would be flexible enough to meet the ever-changing conditions of the new industry and science. Thus it is that, aside from declaring general principles, the determination of most of the factors that may be expected to arise in the dissemination and enforcement of reg-

ulations is in this bill delegated to the Secretary of Commerce. To say to-day, for instance, what wave lengths shall be permissible to certain distributing stations and have those regulations applicable under specific law only a few months hence is quite out of the question. Only by constant observation by an official who can act can conditions be met in a manner that will allow the fullest possible development of radio and the least possible inconvenience and confusion to the millions who are in one way or another engaged in radio activities.

Provision is made for the issuance of licenses to stations sending radiograms or signals by telegraphy or telephony and for their abrogation by the Secretary. One feature of this provision is that no licenses shall be issued for a term of more than ten years. A condition of uncertainty that has existed under the present act as to whether the Secretary was compelled to grant licenses to all applicants is cleared, for the bill provides that he shall use his discretion in granting licenses, on the condition that such licenses shall be only to stations which are in the interest of the general public service. He is authorized specifically to refuse a license to any person, company, or corporation which, in his judgment, is seeking to monopolize radio communication directly or indirectly through the control of the manufacture or sale of radio apparatus or by any other means.

A new feature of the bill provides, as an assistance to the Secretary, for the appointment of an advisory committee to whom he shall refer for examination and report matters relating to administration or changes in the law, regulations, and treaties of the United States relating to radio communication; to study of the scientific problems involved in radio communication with the view of fostering its development; and to scientific progress in radio communication and use of radio communication.

The advisory committee is to consist of twelve members, one each to be designated by the Secretaries of State, War, Navy, Agriculture, and Commerce, the Postmaster-General, and six members of recognized attainment in radio communication not otherwise employed in the Government service to be designated by the Secretary of Commerce.

Finally, and as a new feature of radio legislation, the Secretary is authorized and directed to charge and, through the imposition of stamp taxes on applications, licenses, or other documents, or in other appropriate manner, to collect fees that are specified in a schedule that ranges from a maximum of \$300 for a license for transoceanic radio down to a dollar for amateur first-grade radio op-

erators' examination and fifty cents for amateur second-grade licenses.

CUBA'S TROUBLES

THE financial condition of Cuba is bad, not because the island is not richly endowed with natural resources or that it has serious industrial troubles, but because of bad financiering on the part of the Government, and even more perhaps because of corrupt practices among political office-holders. Two or three weeks ago American intervention was talked of in Cuba as not only possible, but probable. The situation has been relieved for the present by informal pressure brought to bear upon the Cuban Government by General Crowder, who is acting as an observer and informal representative of President Harding in Cuba. President Zayas, of Cuba, has so far yielded to General Crowder's influence and to the best American and Cuban sentiment that he has removed from office some of the men charged with irregularities. This does not get at the base of the trouble in Cuba, and very probably the situation will have to be dealt with more drastically in the future.

There is no doubt about the existence of dishonest officials, and some of them have been pretty high up in the Administration. Ex-President Menocal is reported in despatches as saying that when he lately came back from Europe he was shown proofs of wholesale graft and dishonesty; that he urged Zayas to clean house, but in vain; and that he does not believe that changing a few officials will meet the situation. General Crowder's position, as stated after the dismissal of certain officials, is that, politics or no politics, and despite Civil Service laws said to be in the way, "no man whose honesty is not beyond question and whose ability for the position is unproven shall be appointed to public office."

Most Americans understand that under the Platt Amendment to the treaty by which the United States made Cuba a free Republic the United States has the right to intervene in case Cuba shows herself incapable of preserving order or fails to meet her foreign debts. In point of fact, the United States has intervened, has restored peace and order, and has again set the Cuban Republic going. If intervention should take place now, in all probability it would be of an amicable kind and would not involve military measures unless resistance were made by radical factions. What would most probably be done would be that we should take over the Custom-House, the Treasury, and the oversight of public works. We are told by a correspondent of *The Outlook* now in Havana that Cuba has paid interest

on her external loans, but that many millions of dollars of interest on internal loans remain unpaid, and in that sense Cuba is semi-bankrupt, while the police and postal employees are left unpaid, and directors of public works find Government warrants unhonored.

All the information points to the belief that this deplorable state of affairs would be quite unnecessary under an economic, intelligent, and honest Government, and that, while Dr. Zayas desires to have such a Government, he has been driven by his political debts to allow gross abuses to take root and grow until they have produced a serious condition.

LENINE'S WITHDRAWAL: WHAT WILL FOLLOW?

THE questions most asked in Russia to-day are as to who will replace Lenin and what will be the effect of his withdrawal from office. The fact that no single person has been able to command such support among the Soviets as to be allowed to take up the reins that have fallen from Lenin's hands shows that a critical and complicated state of affairs exists in Moscow.

All sorts of rumors have come about Lenin from time to time for months—that he was dead, that he was perfectly well, that he was suffering from poisoned bullet wounds, and so on. His physical condition, it is now admitted, is decidedly bad; it may be indirectly connected with a wound received long ago, but is largely a nervous breakdown due to worry and overwork. It seems certain that he will not resume the Premiership for many months to come, if ever. It is an interesting commentary on the situation that George Tchitcherin, the former Bolshevik figure at Genoa and probably the ablest man as regards foreign affairs among the Bolsheviks, remains in Germany, evidently more than doubtful of his reception in Moscow under the new conditions. It is said that both Tchitcherin and Krassin are afraid that Lenin's approval of them makes their position in Russia dangerous.

There is no indication as yet that Lenin's withdrawal has modified the absurd and vicious ideas which have prevailed in Moscow; that it may ultimately do so is quite possible. Lenin was in great measure the author of the theory of the autocracy of the proletariat. He was a fanatic in his adherence to that theory, and authorized any acts of violence that seemed necessary to keep it going. Absurd and wicked as fundamentally the theory is, he maintained it with considerable intellectual ability, and the prestige he obtained among soldiers, industrial workmen, and even among many of the peasants was

much greater than that of any other Soviet leader. Most people believe that both Tchitcherin and Krassin are abler men, but they have not Lenine's popularity among the extremists, while Trotsky is chiefly an organizer and executive agent who shrinks from nothing. It would seem reasonable at least to hope that if Lenine is out altogether there should be some gradual lessening of the grip held over the people of Russia by the brute force exercised through soldiers and agents by the centralized Soviet Government, which has not now and never had any mandate from the people at large.

TEACHABLE JAPAN

WHATEVER the change in the Japanese Government may be, there remains unchanged the Japanese thirst for knowledge of other nations. One of the most dramatic contrasts in history is that between the hermit life of Japan for generations and the eager interest of Japan in other peoples, characteristic of her modern period. Indeed, it may have been the very capacity of the Japanese to respond to foreign influences that caused the Shogun to shut out foreigners from Japan for so many years. Japan's language and literature and religion are just as truly derived from foreign sources as the language, literature, and religion of America are. And to-day no country surpasses Japan in the search for the best that other countries can give her.

One of the recent eminent visitors to this country is Mr. Naomichi Oshima,

Counselor and Chief Inspector of the Japanese Department of Home Affairs, who recently sailed from New York after investigating some of the social and economic problems of America and who is now continuing his investigation of social and economic problems in Europe. He is a graduate of the Tokyo Imperial University, where he studied political science. Immediately after his graduation he entered the Government service and, after filling several subordinate offices, was appointed the Vice-Governor of Kanagawa Prefecture. After a few years by promotion he became second Superintendent-General of the Police, and then, finally, Counselor to the Minister of Home Affairs and Chief Inspector of the Provincial and Local Governments. He is an influential man in the Seiyukai party.

Japan's sudden rise from obscurity to a position where she is one of the three great naval Powers in the world is due to her eagerness to learn from all sources, and her skill in sending students of life, of customs, and inventions to all parts of the world that they may gather knowledge of the best that men have achieved and bring their knowledge back to their country. In this respect Japan is worthy of imitation.

MOVING TOWARD AN IRISH FREE STATE

THE elections held in Southern Ireland last week afford a favorable indication of the future of the Irish Free State. In a way, the elections were pre-

arranged; that is, under the agreement reached some weeks ago between the two factions of the Sinn Fein, there was a compact as to candidates who should be supported by both factions so that the result would be a total made up of some such proportion as had also been agreed upon as to the composition of the Ministry. Thus when we see allusion in the accounts of the elections of the "panel" candidates it is much as we might say in this country, "The slate will go through." Many independent candidates ran, however; and the results in these cases seem to have favored the Free State Party rather than the Republican Party. Altogether a good working majority will exist for the liberal as opposed to the "die hard" party. The vote has not been fully analyzed as we write; the matter is complicated by the fact that a sort of proportional representation system of voting was included in that voters indicated second preferences. This affects particularly the independent vote cast by the Labor Party, and it is said that that vote stands at least three to one in favor of the Free State.

The body to which members have thus been elected is variously spoken of in the despatches as a new Provisional Parliament, a new Dail Eireann, and a Constitutional Assembly. In point of fact, it will partake of the nature of all three. It will presumably ratify the Constitution agreed upon by the British Government and the present provisional Irish Free State Ministry; it will then present this to the popular electorate for further ratification, and thereafter a permanent Free State Government will be set up.

All this, however, is provided that the Republican minority does not bolt, refuse to consider any kind of peace compromise, and encourage and maintain its so-called Republican army.

THE IRISH CONSTITUTION

THE proposed Constitution of the Irish Free State declares itself to be "the Constitution of a free democratic state." It puts into form and substance the agreement known as the London Treaty Constitution and treaty alike set up in Southern Ireland a Dominion known as the Irish Free State which in all its broad principles and in many details conforms to the Dominion of Canada and is part of "the British Commonwealth of Nations"—a phrase used purposely in the Constitution instead of "the British Empire." It is a very modern form of government, for it contains provisions for woman suffrage, proportional representation, a referendum, and the power of initiative. It exempts the

Free State from participation in foreign war except with the consent of its own Parliament or in case of actual invasion; it provides for freedom of religion and conscience and contains what is equivalent to a bill of rights. The Free State may maintain its own army, and it is pointed out that this goes further than is the case with Canada, which acknowledges the supreme command of military forces to rest with the Crown. The Free State will have an Executive Council, appointed by its Governor General, but the Council will be responsible to the Irish Chamber of Deputies, which corresponds to our House of Representatives, and the President of the Council, who will really be a premier, will be chosen by the Deputies.

The points in the Constitution which have provoked most dissension from extremists are two. One relates to the oath of allegiance to be taken by the representatives; the other relates to the fact that appeal lies in certain matters from the Irish Government to the Crown; just the same thing exists in Canada, but the opponents of the provision point out that it is a dead letter in Canada, while they do not feel sure that it will be in Ireland. These and other objections are not fiercely urged, and, in general, the proposed Constitution seems to have met with almost surprising approval in Ireland itself.

It would be dangerous to predict anything regarding the future of the Irish question, but the recent events give hope and courage to those who believe in the possibility of representative self-government in Southern Ireland.

THE ROYAL WEDDING AT BELGRADE

WHEN a charming princess marries a popular young king, it is not hard to believe that there really is an element of romance as well as a political motive in the alliance. King Alexander of Serbia, and therefore of Yugoslavia, is described as a proud, studious, and well-behaved young man, in all of which respects he differs from his elder brother, Prince George, who renounced his royal rights in 1909, or, as we sometimes say of men who are ousted from their business or political relations, "resigned by request."

There was every evidence in the rejoicing and enthusiasm on June 8 at Belgrade that both the King and his Queen, Marie of Rumania, are thoroughly liked by the common people. It is also true that the marriage is likely to be of value in maintaining peaceful relations in the Balkans. Although some fifty thousand troops were concentrated in the capital, there was no disturbance, and, apart from the possibility of violence by rabid

THE
QUEEN
OF
YUGOSLAVIA

(C) Underwood

fanatics or Anarchists, no danger of disturbance. The beautiful ceremonies of the Greek Church were performed under the leadership of the Patriarch, and in all respects the wedding was brilliant even among royal weddings.

That a permanent friendship may be assured between Rumania and Yugoslavia by this royal marriage is confidently hoped. The present Queen of Rumania is a woman of great ability and energy—indeed, some persons have nicknamed her the "Mother-in-Law of the Balkans." Her influence has had a great deal to do with bringing about this marriage.

Serbia certainly deserves all the peace and happiness that can come to her; she has emerged from the condition of a small kingdom in danger from Austrian domination and greed to the proud position of being the predominant country in the combination of Serbs, Slovenes, and Croats that make up the relatively powerful realm of Yugoslavia. The courage and determination with which Serbia fought against the fate that Austria tried to impose upon her in 1914 will always remain one of the ennobling and resplendent memories of the Great War.

We may now rightly forget the horror with which the world greeted the tragedy of 1903, when King Alexander, his Queen, four other persons of distinction, and some fifty officers and soldiers were assassinated, with brutal circumstances, by political conspirators. It was after this assassination that the dynasty of the Karageorgevitches was restored and King Peter, father of the present young King Alexander, was placed on the throne. It was a long time before all of the European nations were willing to recognize the new Government set up as the result of revolution. But this feeling gradually passed away as King Peter showed qualities of a vigorous and courageous ruler and led his people into war

with skill and courage. The present King won the title of Peacemaker because of his efforts to unite in common ambition and purpose the peoples now under the Yugoslavia rule and to better the political conditions in the Balkans at large. Alexander succeeded to the throne last year, immediately after the death of King Peter at the age of seventy-six. Alexander's own record in the Great War was brilliant and valuable to the Allies' cause. He had been Regent since 1914, and more than one attempt has been made to assassinate him.

TWO VETERAN COLLEGE ALUMNI

CORNELIUS COLE, of the class of 1847 of Wesleyan University, of Middletown, Connecticut, came last week from the far-away land of California to receive an honorary degree of the ninetieth Commencement of his Alma Mater. Seventy-five years ago this month Cornelius Cole received his Baccalaureate degree. He is to celebrate his one hundredth birthday in September. He is the oldest member of the Psi Upsilon college fraternity in the United States, and of course the oldest living alumnus of Wesleyan.

One President of the United States was dead when Cornelius Cole was born, but his life has run parallel with every other one of them since the foundation of the Republic. He was a member of the House of Representatives in the last year of the Civil War. He was a personal friend of Abraham Lincoln. He was one of the party which accompanied Lincoln to Gettysburg for the dedication of the National Cemetery. He was the last survivor of the United States Senators who took part in the impeachment trial of Andrew Johnson. He was born in New York State, but was an original "Forty-niner" in the gold fields of California. It was from California that he was elected to the House, and later to the

CORNELIUS COLE, WESLEYAN '47

Senate, where he served from 1867 to 1873 during the Johnson and Grant Administrations. He has lived in California nearly the entire three-quarters of a century, and is still practicing in that State his profession of the law, going alone on the street car to his office every day just as he did in his prime.

The memory of his warm friendship with Lincoln is a passion with Mr. Cole. "Lincoln never showed any ill will, or fear, or anger in all his life, so far as I know," says this sage and patriarch. He also corroborates from his own definite personal recollection the generally accepted historical record of the Gettysburg address. He says that only a small crowd gathered about noon for the ceremony. The speakers were seated on a rude wooden platform. Edward Everett finished his polished oration, which few now know anything about. Then awkwardly, in the midst of an impressive silence, Abraham Lincoln stepped to the front of the platform. He began quietly, and finished suddenly with the never-to-be-forgotten phrase concerning a government of the people. Then he turned and took his seat, to the astonishment of every one. The small audience was dismayed at his brevity. Nobody present seemed to appreciate for the moment the beauty of the speech, or to have any instinctive sense of the fame which would follow it.

Another man who figured in an interesting way in recent college Commencement exercises is Dr. Stephen Smith, of Staten Island, who received the honorary degree of Doctor of Science from Columbia. He graduated from Columbia in 1850, and is within a few months of completing his hundredth year. Dr. Smith was called by President Butler "the most interesting figure in American medicine and in American public service to-day." He was founder and first President of the American Public Health Association, and is noted for his work in local and National boards of health, in

sanitation, and in other public health matters, and is still active despite his all but completed centenary.

THE ATTACK OF SENATOR LA FOLLETTE ON THE SUPREME COURT

EARLY in our National life Chief Justice Marshall enunciated in *Marbury vs. Madison* the right of the Supreme Court of the United States to nullify a law of Congress which the Court believed to be in contravention of the Federal Constitution. At the time there was a wide difference of opinion in the country over the decision. Jefferson and his followers attacked it with great virulence. Unquestionably it is a judicial power which is unique, but the decision of Marshall has been sustained by the public opinion of the United States for more than a hundred years.

The reason appears to be twofold. The Supreme Court of the United States has only upon rare occasions proved itself to be without vision, inflexible and reactionary. On the contrary, it has increasingly interpreted the course of National life, not only in terms of vital Constitutional principle, but in terms of normal human progress. We have had a *Dred Scott* decision, and a number of five-to-four hesitations upon grave questions of public policy, but by and large the Supreme Court has been supported by the faith and confidence of the American people. The National Congress, on the other hand, has progressively declined in the estimation of the country. It is a curious anomaly of popular government that the representative branch should so often have failed in reputation as compared with the judicial branch exercising unusually exalted powers.

Nevertheless protests against alleged

judicial usurpation by the Supreme Court have never been lacking. The errors and bias of some of the State courts and of the inferior Federal courts have been sufficiently marked so that from time to time large numbers of the people of the country have been aroused in opposition to the overlordship of the Constitution by the judiciary. In 1911 Theodore Roosevelt stirred the Nation by his widely misunderstood doctrine of the recall of judicial decisions. Roosevelt went out of his way to make clear that his confidence and the confidence of the country were not shaken in the Supreme Court of Washington, but rather in the State courts, which were blocking the wheels of progress upon issues exceedingly important to the welfare of the American people. He maintained that the people of the State, who made their Constitution, were entitled to decide by referendum upon what the meant by their Constitution in extraordinary cases of reasonable doubt. The Roosevelt contention, at least in the form in which it was understood, did not meet with the approval of the country, but it is widely known that his free and vigorous criticisms of judicial methods have exercised an indirect influence upon the minds of our judges and court which is likely to be of permanent value.

Senator La Follette appealed the other day before the Annual Convention of the American Federation of Labor for a Constitutional Amendment making it possible for Congress to overcome an unfavorable decision of the Supreme Court by re-enacting the law after the decision. This is something after the fashion of the present English method of overcoming an unfavorable consideration of Parliamentary measures by the House of Lords. The House of Commons ultimately becomes supreme by re-enacting the measure. Under American conditions and with a knowledge of our history to guide us, it seems that the adoption of anything analogous to the British

(C) Paul Thompson
STEPHEN SMITH, COLUMBIA '50

ish method would be dangerously revolutionary. It is essential that we keep the Supreme Court as a check upon hasty and ill-advised action by Congress. Those who are most anxious to preserve our Governmental system as it has developed cannot afford to ignore the feeling which underlies so radical and subversive a plea as that of Senator La Follette. These sporadic uprisings of popular sentiment against what are regarded as unprogressive and illiberal finalities of the Supreme Court should warn the Court itself of the ever-present danger to its existence as a necessary check upon Congress in our Governmental system.

• The La Follette manifesto, as well as that of President Gompers, of the American Federation of Labor, is leveled against the recent Coronado and child labor decisions of the Court. So far as the Coronado decision is concerned, Mr. Gompers and his group criticize everything which seems to them to injure the laboring class. As a matter of fact, the Coronado decision endangers it only in the sense that the labor leadership under Gompers has steadily arrogated to the laboring class certain peculiar privileges of action which do not stand the test of scrutiny from the point of view of the National welfare. On the other hand, the child labor decisions of the Court appear to us to rest upon uncertain foundations. The whole country wishes to do away with the evils of child labor. No one State can control the policies of another State. It cannot erect a barrier against unfair competition from the child labor of another State, and now the Supreme Court avers that the Federal Government can do nothing, either. An enlightened State which is interested more in the conservation of childhood than in child exploitation for profit must pay the penalty and be subject to the flood of child labor products into its own area, to the economic dis-

advantage of its own producing citizens. We cannot help feeling that here is an instance where a clearer vision and a profounder mental grasp on the part of the Court would have found a way of reconciling legislation with Constitutional precedent and of making judicial decision interpretative of the will of the people.

THE UNITY OF THE SPIRIT

NO one can doubt the evils of sectarianism. They are abundant and only too evident. Half a dozen churches in a village do feebly a common work which, if they were working together, they might do with strength. Money is spent almost uselessly in maintaining separate church organizations at home which is sorely needed in doing the too often neglected work of the Church abroad. Each church is tempted to put its emphasis on its own pet doctrine or symbol, to the neglect of truths and duties the importance of which all recognize in theory rather than in practice. Hostility between the churches is mostly a thing of the past, but the emulation between the churches is not always an emulation in works of charity and mercy. And the great world without, which admires strength, looks with indifference and sometimes with contempt on churches whose feebleness seems to non-churchmen to be due wholly to immaterial differences.

But those in the Church who are attempting to cure these evils by making out of these fragments a united Church, with one theological creed, one form of worship, and one ecclesiastical order, appear to me to have short memories. They forget the greater evils which have always resulted when churchmen have endeavored to secure unity of the spirit by uniformity in doctrine and worship. The Roman Catholic Church in the Middle Ages insisted on one creed; one ritual, and one authority; the result was the Inquisition. The Greek Church pursued the same course, though less successfully, and the religion of Greece and Russia is the result—life sacrificed to form. The Anglican Church repeated the attempt; the despotism of Laud rivaled that of Strafford, and the persecution of the Scotch Covenanters was scarcely less atrocious than the Roman persecution of the Albigenes. The Puritans got a brief period of control; the worship with a Prayer-Book, made compulsory under Charles I, became a crime under Cromwell. The Pilgrims and the Friends advocated real religious liberty, but whether they

would have continued to advocate it if they had possessed the power of the Roman, the Greek, the Anglican, or the Puritan may be questioned. From the days of Caiaphas to the present day ecclesiastical power has stimulated ecclesiastical ambition. The problem of the Church is not merely how to bring about union. The evils of disunion are feebleness; the problem of the churches is how to achieve a union which will bring power without sacrificing liberty.

The advocates of Church unity might well learn a lesson from the political history of the world. Unity of spirit and division of authority has, I think, without exception been a condition of political freedom. England is a union of what were once independent kingdoms, but county government has survived the union and imposes limits on the power of Parliament none the less real that they are not defined by a written Constitution. The British Empire affords a striking illustration of power combined with liberty. The Established Church in England is Episcopal; in Scotland the Established Church is Presbyterian; and in Ireland, Canada, and Australia there is no Established Church. The union of free States in a free Republic is not less strikingly illustrated by the United States. It is a spiritual unity—that is, a unity of free men in a free Nation. "It was a true instinct which led the framers of the Constitution to begin with the statement: 'We the people of the United States.' It was the individual citizens who could unite, and not the 'States.' The same is true of the churches. The various churches cannot unite, though they may co-operate and associate themselves for more effective work."

In these words Dr. Leighton Parks admirably states in his recent volume, "The Crisis of the Churches," the problem of Church unity. In a single sentence in another part of the volume he states it with equal clearness and greater brevity: "The only possible way in which religious men can be held together is by substituting loyalty to Christ for theological agreement."¹ This book appears to have been written especially for the clergy or the lay churchmen of his own communion. Its size will probably limit its circulation to that constituency. I wish that he could be induced to make out of it a volume about the size of Dr. Fosdick's "Meaning of Prayer," addressed to the laymen of all communions. The movement for Church unity must first be won among the laity.

The fact that the rector of St. Bar-

¹The Crisis of the Churches. By Leighton Parks, D.D. Charles Scribner's Sons, New York. \$2.50

tholomew's Church, one of the most influential and active of the Protestant churches in New York City, has devoted a volume to the elucidation of this truth, is one of the hopeful signs of the times; in my thinking, far more hopeful than the hitherto vain endeavor to find some common ecclesiastical ground on which all Christians can unite in a common organization. The Roman Catholics will not accept the Episcopal orders, Episcopalians will not renounce them; the Friends will not accept the Episcopal sacraments, nor the Episcopalians receive into their communion those who do not; the Baptists will not accept infant baptism, nor will the non-Baptists repudiate it. The Nicene Creed is doubted by some excellent Christians, and to many its phrases are meaningless; probably a large majority of the clergy of Protestant churches disbelieve in the doctrine of the Apostolic Succession, which all Catholics—whether Greek, Roman, or Anglican—regard as vital to organic unity. Union based on creed, ritual, or orders is quite impossible of accomplishment, even if it were desirable.

But there is nothing to prevent the churches anywhere, at any time, in any place, from uniting in a common work, bound together in a spiritual fellowship by a common purpose. The way to such a unity has already been marked out for the churches by the unity in Christian work and Christian fellowship in the Y. M. C. A. and the Y. W. C. A. There is no reason why in any village where there is a Baptist church, a Methodist church, an Episcopal church, and a Friends meeting the worshipers should not continue to worship according to their various tastes and temperaments,

but unite in their public service to the community. And there is no good reason why we might not look forward to the time when one village church should become broad enough to hold an early communion every Sabbath morning at half-past eight, a full service of prayer and preaching at eleven o'clock, a Prayer-Book service at four o'clock, and a Friends meeting in the evening. Queen Victoria, I believe, attended the Episcopal Church in England and the Presbyterian Church in Scotland. It is not too much to hope that American Christians will in time become as broad as the English Queen.

LYMAN ABBOTT.

WE FORGET THE ELEMENTS

CIVILIZATION has a way of forgetting the elemental forces of nature, but the forces are not asleep merely because we choose to ignore them. Sometimes when our backs are turned they strike us down like the sudden and secret spring of a panther.

At least to civilized man the blow seems to come without warning. But those who have not forgotten all the lore of simpler times—those who know the ways of the winds and the waves—are not so often caught off their guard. If the blow comes, they can at least meet it face to face.

A short while ago a storm swept over the metropolis. When it passed, it left half a hundred dead in its wake. Many of those who died lost their lives in open boats in the waters surrounding New York. The newspapers wrote headlines concerning the catastrophe which

painted it as an unforeseeable disaster. Any one who knew the actual conditions of the day of the storm must have been certain that much of the loss of life could easily have been avoided by very simple precautions. The storm itself was not a local disturbance. It had been sweeping eastward across the country for many hours. Even to those who had no access to the weather reports the sky itself might have given adequate warning, but city folk cannot read the heavens and there was no Governmental agency to see that they did not suffer for their ignorance.

New Yorkers are likely to remember this storm and forget the lesson. We wonder if other communities faced by similar conditions can profit by New York's loss. Wherever city-bred people foregather in open boats for recreation there should first be a rigid inspection of the craft offered for hire and perhaps a drastic cutting down of the present number of passengers which such craft are permitted to carry.

The Police Department, or some similar agency, should have the power to prohibit the renting of boats on days when danger is in the air. At least there should be police launches enough to carry warnings to those who are ignorantly endangering their lives. The storm signal system should be extended to give warning of weather which might endanger the safety of small boats, even though it carries no threat to more seaworthy craft.

There are many lakes, rivers, and bays in the neighborhood of large cities where lessons of the New York disaster might be taken to heart, but we do not venture to hope that they will be so applied.

A PRIVATE DISPUTE AND A PUBLIC CALAMITY

SPECIAL CORRESPONDENCE FROM WASHINGTON BY WILLIAM P. HELM, JR.

THE people of the United States are facing a certain shortage of anthracite coal next winter. The damage was done during the three months of April, May, and June, and there is no longer speculation as to the result. Under no conceivable set of circumstances will there be enough hard coal for everybody when winter comes. If all the anthracite mines were to resume work to-morrow and work at full capacity, they could not produce sufficient coal to avert the shortage.

The bituminous-coal situation hasn't gone quite so far to the bad, but is on its way there with a whoop. The bare boards are showing at the bottom of the consumers' stock piles. Within the next two weeks stocks will touch the danger line of 20,000,000 tons. When that line

is passed, industries will begin to close down. The non-union mines, in clover for the past three months, can't bring enough coal to the surface to keep all American industries going. At our present rate of industrial consumption, non-union mines can supply from sixty to seventy per cent of what is needed. The other thirty to forty per cent of our reviving industries temporarily must go out of business. Either that or all industry will average about four days a week working time.

That looks like an overdrawn picture; but it isn't. Cold figures of production and requirements do not lie. Moreover, they are known quantities, not guesswork. The Federal Government takes their measure, and for years has come within two or three per cent of the truth

in its preliminary estimates. A certain shortage of anthracite and a probable shortage of bituminous are what the figures show, handle them as we may.

In the face of this prospect, about 500,000 workmen and 3,000 mine owners, solely responsible for the present situation, continue with unabated ardor the quarrel which brought it about. Indeed, in the anthracite industry the quarrel has intensified. It is more acute to-day than it was April 1. A nation's comfort, welfare, and prosperity have been flouted, disregarded, and subordinated to a private dispute over a day's wage.

In the bituminous industry the only apparent improvement since the day work stopped has been, at this writing, a whisper that miners and operators in Ohio and Illinois may get together after

a time to see if they cannot reach a mutually satisfactory basis for resuming work.

With unexampled patience the Federal Government has kept hands off the fight. An energetic Cabinet official, acting as public protector, has checked, apparently, the tendency to profiteer in such rations of coal as are available. Even at that, only eighty per cent of the working operators are with him. But Congress has taken no action. Apparently it has trusted the warring elements to realize, without coercion, their responsibility to the public which makes possible their economic life. Thus far its trust has not been justified.

There are rumblings, however, on Capitol Hill that tell of the gathering storm of public displeasure. The storm will break, in the writer's opinion, when the actual pinch becomes acute. For three years and more the coal industry has thwarted all attempts at Federal regulation. It has brooked no suggestion that it account to the United States. It has defied Frelinghuysen, Calder, Kenyon, and La Follette, not to mention numerous men of lesser stature. It has weathered five Government inquiries. It seems to lead a charmed life of immunity; but the charm will be worked overtime shortly. There is growing wrath in Congress at the wrong being wrought upon the public in these weeks of returning prosperity, and that wrath is fermenting and effervescing and threatening explosion at any time.

Summed up, that is the situation as this article is written, on June 19. Up to that date the public generally had not felt the coal strike. No one needed anthracite to heat his house, and when the strike began industries were abundantly stocked with bituminous. Besides, there was non-union soft coal to be had by the shop or factory; and the householder, if he wanted to lay in a stock, had no difficulty in obtaining anthracite. Freight rates were cut ten per cent, effective July 1; and the miners' contention for a war-time wage or more seemed unsound and likely to fail. The consumer, expecting lower prices, felt justified in his waiting attitude.

There are two classes of coal consumers. By far the more numerous is the householder. He and his Canadian neighbor buy all the anthracite coal mined except about thirty per cent that goes into small sizes, used mainly for industrial purposes.

Supplying this demand are anthracite mines, all located in a small field in Pennsylvania and with a limited producing capacity. They have never exceeded 100,000,000 tons in any year; their recent low-production figure was 86,000,000 tons. An average might be fixed at about 91,000,000 tons. In no single week has production gone much higher than 2,000,000 tons. Present producing equipment has set this limit, apparently, upon the mines.

Because of Sundays, holidays, and other causes, the average working year

is about 260 days, or an average of five days a week, fifty-two weeks a year.

Both anthracite and bituminous producers begin their coal year April 1. It has become the trade custom for various contributing causes, none of which is pertinent to this article.

On July 1 thirteen weeks of the present coal year will have passed. During that period the anthracite mines have been shut down tight. During the remaining thirty-nine weeks, therefore, the entire year's output of 91,000,000 tons (less stocks carried over in anthracite operators' storage yards April 1) must be produced to avert a shortage. While stocks carried over have never

Official U. S. Navy

AERIAL PHOTOGRAPH OF THE RADIO-CONTROLLED BATTLESHIP IOWA

The ship is here shown steaming along without a soul on board, all her movements being directed from the battleship Ohio, twelve miles away. Can one conceive of a more generous gift to those engaged in ocean-borne commerce than this business of radio control, where a leading ship of a commercial fleet may take a number of cargo carriers across the ocean with the crew of one?

WHAT are we going to do with our superannuated navigators? Radio is putting them out of business. For in a comparatively short time the navigator who boards his ship carefully carrying a mahogany-encased sextant and with a 'Bowditch' tucked under his arm will be as out of date and as comical as the old straw-chewing rube of the vaudeville stage, ambling along the canyons of New York, carrying his ancient carpetbag and green umbrella.

"The gentlemanly navigator of tomorrow is a radio engineer. He sits at a mahogany table in a comfortable office on his modern ship, smoking fat cigars, pressing neat pearl-topped buttons, and letting 'King Radio' do the rest. One button tells the depth of water under the keel; another, the distance and direction to the nearest ship, and of all ships within a radius of twenty-five miles; a series of buttons reveals the nearest land, the distance to it, the course to reach it, and fixes the ship's position on the surface of old ocean. All these fancy navigational 'stunts' are easily explained—the apparatus which does the business is now in daily use, and is functioning accurately."

This is the prophecy of Lieutenant Clifford Albion Tinker, U. S. N., whose article "Radio and the Navigator" will appear in a forthcoming issue of *The Outlook*.

been made public as to total tonnage, they will hardly exceed 10,000,000 tons. Indeed, it is doubtful if they approach that figure.

Eighty-one million tons must be produced, at least, to meet the year's demand, and there remain thirty-nine weeks in which to do the job. If the job were done, beginning July 1, the anthracite mines would have to produce more than 2,000,000 tons a week every week from that date to April 1 next. It can't be done, because it is a physical impossibility to do it.

The misery of an anthracite-coal shortage, therefore, is upon us. The extent of the suffering will be gauged by the length of time the anthracite mines are permitted to remain idle.

Bituminous-coal mines are limited chiefly by car supply. During the thirteen weeks of the strike the non-union mines have produced about 59,000,000 tons, which, added to the great stock pile of 63,000,000 tons April 1, gives us a total of 122,000,000 tons as representing stocks and production. Consumption during that period has been not less than 7,500,000 tons weekly—probably 8,000,000. Using the lower figures, however, to be conservative, total consumption has approximated 98,000,000 tons, leaving the stock pile at 24,000,000 tons July 1.

The average weekly consumption of bituminous coal the year round, at our present rate of industrial activity, is estimated by Geological Survey officials at 8,000,000 tons, or 416,000,000 tons for the year, slightly in excess of last year's production. A calculation, taking into consideration a safety stock of 20,000,000 tons, shows that in the thirty-nine remaining weeks of the coal year, assuming the mines were to resume July 1, bituminous coal must be mined at an average rate of not less than 9,000,000 tons a week.

That task is possible. A shortage would be felt, however, because of the rush of orders during the summer and fall. That, too, is the season when New England and the Northwest stock their coal for winter, taking it by water while water transportation is good. To meet demand from July to November 1 bituminous mines must produce not less than 10,500,000 tons a week, and, while that can be done, it is extremely difficult. That was about the average two years ago, when other industries were stripped of cars to carry coal, when whole States felt the shortage and coal soared to robber's prices.

But as resumption of mining, anthracite or bituminous, is unlikely July 1, the foregoing is ultra-conservative. In other words, the almost certain prospect of unheated homes and offices, shivering women and babies, shut-down industries and crippled transportation, isn't a true picture because it falls short of what is in store for us as the result of this little dispute over a day's wage in a private industry.

DAVID LLOYD GEORGE

EDITORIAL CORRESPONDENCE FROM GENOA

BY ELBERT FRANCIS BALDWIN

FOR years I have read the speeches of Lloyd George, and I have seen him occasionally—generally at a distance. But not until I met him personally and talked with him did I really appreciate the kind of man he is.

In the first place, he is a stockier, sturdier, more closely knit person than I had supposed. My idea of him had of course been influenced by the caricatures in the illustrated press, where his hair is always too long and curly, his mustache too stubby, his eyes too watery, and his expression too all-things-to-all-men. As I spoke with him, I saw no very long, flowing locks, no bristling mustache, and no watery but, instead, clear, sharp, shrewd eyes, looking at me with what you might call "pondered assurance," and "eating me up," as we used to say at school.

Lloyd George knew all about The Outlook. I did not have to explain that it differed from the London "Outlook." You don't have to explain anything to him as to facts. His knowledge of them is accurate and prodigious.

Some people, however, have had to explain principles. The people who during the Genoa Conference have been explaining things to him have been the Belgians and the French, who are determined, as is America, to make no concessions in Russia inconsistent with their self-respect.

Lloyd George's mental power does not impress me as belonging to that somewhat small class of men who persistently and perhaps painfully think out problems "to the buttons on the back of their coats," to quote a phrase from Theodore Roosevelt. But, as a lightning calculator of the moment, the Lloyd George power is simply marvelous. As your photographer will do you a photograph while you wait, so Lloyd George will do you a quick, subtle, study of a given situation—in the labor world, or in Ireland, or in Russia, for instance—which challenges your attention, if it does not your confidence. He seems to see a lot of things unseen by other men. His mental processes are as fascinating as they are instant.

Lloyd George in action is even more interesting. Of course if he could always act "off his own bat" he would have an easier time. But he is hampered by three things. First, there is the task of making Liberals and Tories work together harmoniously in a Coalition Cabinet under his Premiership. Even without this particular task, however, any British Prime Minister would have to shoulder the other two tasks—namely, those of pacifying the mercantile class (which ever since the war has wanted to regain its two customers, Ger-

many and Russia) and the labor class, more or less affected by Communistic theories.

To overcome these difficulties, Lloyd George needs, and has, three necessary qualities—ingenuity, tact, and courage. Some weeks ago I saw an excellent exhibition by him of them. He had invited some journalists to meet him, and when we arrived announced himself ready to answer questions. Questions and answers succeeded each other smoothly until a particular query from a German journalist was reached: "What were the circumstances which led to the conclusion at Berlin of the Russo-German treaty, just signed at Rapallo?" Lloyd George looked sharply over to where a few German journalists were sitting and said: "I hope that the questioner will not insist on this question. I know under what conditions this treaty arose. But we are here, not to discuss the past; we are here to discuss the future. A mere nothing can muddy the clear water. I should regret, therefore, if the German journalist insisted on this question, and if I had to reply." On this it was not hard to see that there was divergency of opinion among the German journalists. They put their heads together. The reasonable part of them won. The question was withdrawn.

The English Prime Minister has one quality which distinguishes him among Englishmen because the quality is not so much English as it is Celt, and that is imagination. He gave a bold, if not altogether happy, exhibition of it the other day at a lunch offered by the British delegation to the British, American, and Italian journalists. He said: "My own village in Wales is full of Norman ruins. But the oldest structure there is an old Roman wall, which is always in condition to be used." With this frequent imagery, Mr. Lloyd George gave a symbolic sense to these words, by no means lost on his Italian auditors. The old Norman walls now in ruins they took as representing the Anglo-French Entente, but the old Roman wall, always standing and serviceable, as representing the Anglo-Italian friendship of longer date and now stronger than ever. The Prime Minister wanted to please Italy. And she had reason to be satisfied with the rest of his discourse as well. It was of an eloquence only to be compared to the oration of Paul Deschanel at Paris in 1915, commemorating Italy's entrance into the war. To take a fling at France, however, a few hours after the Genoa Conference had closed its sessions was, to say the least, extraordinary, and causes resentment among the friends of France.

In truth, Lloyd George has the defects

of his qualities. The touches of imagination, humor, and humanity which illumine all his speeches and all his conversation are sometimes unnecessary, no matter how brilliant. For instance, I heard him say: "Genoa gave to the world the discoverer of America. Let us hope that Genoa will now help America to rediscover Europe."

Later he explained: "I wanted to see America at Genoa because she has a special position and authority which we have not. America is fresh, free, independent, not mixed up in our controversies, and with an authority due to her world position."

Probably Lloyd George's keenest disappointment has been in our refusal to follow his Russian policy, whether at Genoa or The Hague or anywhere. He knew very well how justified were the economic reasons which prevented our taking part in the Genoa Conference. But he also knew, even better, how justified was the political reason. He and the Italian Foreign Minister seem determined to catch hold of Russia's skirts, at whatever cost. We, the Belgians, and the French, on the other hand, know just what loss of moral self-respect is involved in such a transaction. Instead, then, of endeavoring to obtain concessions, which would only mean recognition of the present Bolshevik Government and perpetuate its unholy power, we prefer to stand aside until that power drops of its own weight and we can negotiate with the real Russian people, now enslaved by one per cent of the population.

But what would you? England and Italy thirst for new trade. In neither country is there appreciation of the very small amount of trade which can be obtained from Russia for years to come. But even were it a large amount, the principle would be the same. You cannot afford to touch pitch if you expect to keep your hands clean.

In all this matter, as well as in many others, the English Premier shows another quality—emotionalism. Though the two men are strikingly different in make-up and manner, ex-President Wilson, if I mistake not, shares the same quality. It is not necessary to have an effervescent manner in order to be an emotionalist. President Wilson's manner is calm and dignified, not to say chilling at times. Lloyd George's manner is dignified, but his frequent flashes of wit and his human touch make one think more readily of emotionalism. And emotionalism run to seed becomes obsession.

Only thus can one explain certain of Mr. Wilson's courses at Paris, and especially his course at Washington with the Senate regarding the League of Nations

Covenant. Only thus can one explain certain of Mr. Lloyd George's courses here at Genoa, especially his persistence in trying to get the Bolsheviks to listen to reason. This would have been all very well if he could have obtained a tenth part of what he wanted. But, even so, what would their promises have been worth?

In general, one may say of Lloyd George that he is an opportunist. At the close of the war, for example, he was all for getting the last cent out of the Germans and for stringing up the Kaiser on Tower Hill, if necessary. Now he is all for letting the Germans have all the concessions possible and even for giving an extra lease of life to the Bolsheviks.

Of course you may say that this covers a three years' period, and that even a clever man may change his mind in three years. But Lloyd George has been known to do it in a great deal less time than that. They tell a story of a meeting at which he and Balfour were the speakers. Balfour began and outlined the Government's policy. It found no approving echo among the auditors. Lloyd George was quickly conscious of this, and when he spoke announced that the Government's policy had been modified. Not to be outdone, Balfour spoke a few closing words, in which he also smilingly assured the auditors that the Government's policy had been so and so, but was now so and so.

It would be a mistake, nevertheless, to magnify the opportunism of the English Prime Minister too far. He is an opportunist, and that must be reckoned with.

He is no great compelling, uncompromisingly elemental force, like Clemenceau, for example. He is no Tiger. In comparison he is a wolf.

But he is a great man, just the same. In his power of manipulation and tact gentleness is mingled with genius. He has thus saved England from more than one dreadful labor clash. He has done more than any one else to solve the Irish problem.

His willingness to work with other statesmen is also one of his best qualities. He has known how to manage affairs harmoniously with men of widely opposing characteristics.

And, in all, he has had an almost paternal manner, which suits him well. Here at Genoa he exercised that manner on more than one occasion (as I can personally witness) with extraordinary persuasiveness, being helped thereto by the lovely quality of his high-pitched voice.

He is not a great orator, as some statesmen have been. His gestures are about what you might expect from an oak tree, could it speak and wave its arms. But he speaks with the force of a massive oak tree, just the same. A few days ago I heard him address these words of scorn to the Bolsheviks, who wanted a loan before they had given any proof that their Government was becoming civilized and orderly. The language shows that Lloyd George could display courage with them when necessary:

"Your reply has provoked a disastrous effect everywhere. If that were to be Russia's last word, we would have to despair of results at The Hague. Certainly Russia is missing in the world

market. But she needs far more the help of the other Powers in order to raise herself from her frightful prostration. She can obtain this aid, but she must act differently, unless she expects to repel the sentiments of the immense majority of Europeans who sympathize with the Russians in their misery.

"We have certain prejudices. In western Europe, for example, when a man sells goods, he likes to be paid. If a man seeks his neighbor and asks for aid, he does not succeed in borrowing if he declares that his principles do not allow him to repay his creditor. So, when a country asks for a loan, it is not a good way to get it to begin by declaring that the country repudiates its debts."

These blunt sentences were cheered to the echo by all present except the Germans and Russians. I am only sorry that Mr. Lloyd George did not speak out in this way on the first day, instead of on the last day, of the Conference. While the sentences display the courage of which he is capable, the courage, one may say, may have been tempered by opportunism, and hence that which would have been a more ringing sentence on the first day was held till the last for fear of offense. This may be a harsh judgment, I believe, for on the first day of the Conference we were not in possession of all the facts which had developed before the last day arrived.

All in all, Lloyd George is a fascinating person and a mighty power. He is a great deal more attractive than he is represented to be either by photograph or description. But he does not always strike twelve. Who does?

THE EDUCATIONAL MOVEMENT AMONG AMERICAN WORKERS

BY FREDERICK M. DAVENPORT

ON the surface the United States is pretty proud of its system of universal popular education. Underneath, the validity of it as a successful going affair is being questioned more and more every day; questioned by experts who observe vast and increasing expenditures and abortive results so far as the mental morale of the masses is concerned. It is not simply that the educational pabulum is proved unnutritive for large numbers of the population, but that two-thirds of the child population drop the system entirely before they get much out of it. Around fourteen years of age the great majority quit the schools in a pretty raw state from the standpoint of mental or civic discipline.

And side by side with this insufficiency of process and product the last few years have witnessed the beginnings of a Nation-wide movement among American workers of the tool-using

trades to supply the need which they themselves are beginning more or less instinctively to feel and which their leaders consciously recognize as vital to the progress of the working class. It is a spontaneous and individualistic movement which has produced a variety of experiments in different parts of the country. There are eight or ten so-called labor colleges in cities like Boston, New York, Washington, St. Paul, and Pittsburgh. With a natural leaning towards intelligent leadership and experience, these labor institutions have sought the help and the inspiration of the neighboring regular colleges and universities, and courses adapted to the needs of workers and the leaders of workers in economics, in finance, in government, in history, in English, in industrial technique, in labor problems, in hygiene, in appreciation of music, in elementary science, are being given by sympathetic professors from the near-by institutions of higher learn-

ing. The trade unions and the student workers foot the bills. Besides this institutional development educational classes and forums and courses of instruction in the problems dearest and nearest to the heart of the worker have suddenly sprung up in many cities of the United States. Professors from colleges like Amherst and Hamilton have lectured and conducted discussions in the trades assembly halls of Springfield and Holyoke and Utica. Bryn Mawr last summer opened her doors to about one hundred picked young women from all over America, who were supported for two months mainly by the funds of their labor organizations, while these representative tool-workers underwent experiences of inspiration and enlightenment that powerfully stirred their lives. Similar instruction will be given at Bryn Mawr during the coming summer.

This whole movement has sprung up so suddenly and so silently that it has

been almost without observation on the part of the general citizenry of the country. It has been checked somewhat, too, because of the period of unemployment and labor disorganization during the last year. But it is already deeply rooted and has a significance which is more than temporary. Have we forgotten that our American system of attempted universal education for the children of the masses of the people, which has led the world at least in its desire to give democratic access to knowledge, really originated, not with Horace Mann or William E. Channing, but with the instinctive yearnings of the labor masses in the twenties and thirties of the nineteenth century in the eastern part of the United States? In that early time the free school, supported by public taxes and controlled by the public will, was unknown. There were private pauper schools, for example, near industrial communities in Pennsylvania, where poor children might be educated in return for funds appropriated by the county commissioner. The great lack of the children of the masses of the people brought forth a report from the Philadelphia Mechanics' Union in 1830:

In a republic the people constitute the government, and, by wielding its powers in accordance with the dictates either of their intelligence or their ignorance, of their judgment or their caprice, are the makers and rulers of their own good or evil destiny. There can be no real liberty without a wide diffusion of real intelligence; and education, instead of being limited, as in our public poor schools, to a simple acquaintance with words and ciphers, should tend as far as possible to the production of a just disposition, virtuous habits, and a rational, self-governing character.

I have been at some pains to inquire into the methods behind this most recent spontaneous burst of self-consciousness affecting the better education of workers, and I am confident that it is more than a rebuke to our self-satisfied conventional ideas of what constitutes a sufficient training for the masses. It represents an eager yearning for the larger life of the spirit. It represents an inchoate belief that militancy in labor controversy is on the wane and that intelligence, knowledge of the past and of many things, collective brain power, is the weapon of the future against the forces which labor feels are arrayed against the worker under the competitive system of economics. It is a challenge to the educational leadership of America. It demands for the twenties and thirties of the twentieth century a reorganization of public education as far-reaching as that which the masses under the leadership of men like Horace Mann and William E. Channing demanded in the twenties and thirties of the nineteenth century.

I was talking the other day with a very intelligent walking delegate of the building trades union in a near-by city,

whom I helped a bit in inaugurating a winter's course of lectures and instruction in the trades assembly hall for several hundred representative workers.

"Do you see any sign," I said to him—for he was familiar with the goings on in other parts of the State—"that this is a propagandist movement to further working-class economics and struggles?"

"In some cases it is," he said. "The radical unions are trying to turn it in that direction. They go in strong for lectures and discussions about class economics, with a jazz dance afterwards to attract the crowd to the lecture. But the movement generally in the trade unions is something very different from that. I was in the Army. We younger laboring men got some discipline there, and we know what we have missed in life. And the leaders of the workers know something is wrong. We cannot defend a good many things that have become ordinary labor practice. The trades are deteriorating. There is no getting away from it. Mechanical ability is getting to be at a premium. Apprenticeship is being avoided by young men. Our mechanics are below par. The speed and engineering of construction is pretty good, we will admit. But the average individual laborer is now lost unless you put him in with a gang."

As I listened to him I thought that the logic of what he said meant that our system in popular education and in industry is driving workers into a sort of unintelligent, Socialistic herd in order to survive. Individualism is fading out under the existing system.

"Last winter in the trades assembly hall," my friend went on to say, "we had nearly three hundred in attendance right along, representative of all kinds of working people. Their faces showed that they were absorbed in everything that went on. The questions that some of them put over were humdingers. They would take a crack at the gold standard, or the Adamson Law, or anything else in sight. One fellow wanted to know why the National Railway Law guaranteed six per cent to the owners but there was no certain guaranty of a continuous minimum rate of wages to the workers. The Socialists made a little trouble in the way they asked questions. They were always a little nasty. But I rapped them pretty hard as the presiding officer, because we were there for the general good, and not for the good of the Socialists alone, or even of labor alone. We wanted to know more than we do about a good many things. We are hazy in our minds. The workers are headline readers, and somebody must begin to get us to think."

I talked recently with one of the women who taught courses in the workers' summer school at Bryn Mawr last year. At Bryn Mawr out of two hundred and twelve applications from every quarter of the country a selection was made of about a hundred students to whom were awarded scholarships. Ten

were selected who had held positions of leadership in labor organizations to act as a stabilizing and harmonizing influence in the school. The rest were plain rank and file. Twenty of them were Jews, twenty Roman Catholics, the rest Protestants or "not indicated." One-third were natives of American blood, one-third had at least one foreign parent, and one-third were foreign-born. They represented nineteen States from Rhode Island to California, from Minnesota to North Carolina. Two-thirds of them were twenty-five years of age or over. Four of them had begun to work before they were twelve, nearly all of them were at work between fourteen and sixteen. Four-fifths of them had previously been trying to hew out an education for themselves by attending evening classes somewhere.

My friend who was the Bryn Mawr instructor of these young working-women, of large experience in the regular conventional education of those who can pay their way, told me of the report she had made to her fellow-alumnæ upon her summer's teaching. She said:

I found my task difficult and exciting in the highest degree. The girls had a calm, clear gaze that looked you through—suspicious, sensitive, challenging, armed with absolute candor. They were not lacking in untrustfulness. As one of their leaders said, "We have been duped so many times." They had risked so much to come. For railway fare and incidentals they had used their savings. They were in some danger of losing their jobs which they had left, particularly in a year of unemployment. They cared almost terribly what they got, and were determined to get it or know why they had failed. Nothing could be "put over." All dogmatic assurance, all glibness, all bluffing dropped away by themselves. You had to be ready to have any statement questioned, any idea challenged, to give unlimited time to discussion, to questions, to opposing claims. More than once in the first two weeks I should have bolted had I dared. I never once went into a class but with my heart in my mouth. I heard more than one of the teaching staff declare that they had been spoiled forever for ordinary college classes. All other teaching seemed tame in comparison to teaching a group who cared as those girls cared. A teacher cut his class one day; the office was promptly mobbed to see when the lost hour could be made up.

This particular woman instructor who told me this taught English literature. She said:

I found that the note of the actual present was what reached them most immediately. The subject-matter they naturally took to was the all-embracing lovingness of a Hauptmann or a Whitman. Masefield's passionate personal quest of beauty struck them as "selfish." Their class consciousness, the religion of the unions, seemed to make them impatient of anything narrowly individual. They went to

(C) Underwood

A GROUP OF STUDENTS AT THE BRYN MAWR SUMMER SCHOOL. THE SECOND SESSION WILL SOON BE UNDER WAY

learn as fellow-workers in one class, not to move out of that class. "We want our teachers to realize," said one, "that we are workers and shall remain so." They were an eternal lesson to me in constant thought of others of their group, especially of others weaker, worse off than themselves.

Some of the students would ask for lists of books, of modern plays "worth reading;" in one case, of "books suitable for my little nephews between nine and thirteen, who have to live in so bad a part of Chicago. They are my sister's children—she has seven. My brother-in-law is a horse-shoer, and for his profession has to live in a dreadful district. I want to give the children at least the right books."

"Did you do nothing but sew labels on shirts for nine hours a day for five years?" I heard one girl say to another. "How did you stand it?" "Well, I knew if I quit working I'd quit eating, and I never just saw my way clear to get out of it," was the reply. And so the girls thought these summer weeks precious worth while. When I looked for some of them to say "good-by" on the last morning, I was told, "They have gone off into the woods to cry." Several of them left us saying they were going to save and save for the coming year to pay for a scholarship for themselves next summer, "if the school goes on;" others, still more characteristically, said "good-by;" they should not try to come back at once—"not till lots of other girls have had a turn;" they intended to earn and save for that.

And my friend concluded what she had to say about her experience at Bryn Mawr with the remark that she could wish for all the graduates of her College that they might count among their in-

timates gallant and shining spirits in the group which she had sought to serve during the summer, "that we might start our children thus on the way of serving the future, of setting their feet on the Highroad That Goes On."

I have had the pleasure of reading some of the Christmas letters which these young workers wrote back to Bryn Mawr last winter. They are full of an eagerness and yearning which is unmistakable, and of a spirit of appreciation which is profound.

This from one:

When I reached home on that last Wednesday night, it was awful quiet with just my mother after living eight weeks with a hundred of the nicest people in the world; but I found many domestic jobs awaiting my return which I was glad to have to do, as they occupied my hands and thoughts until I return to work at the laundry on the following Monday.

This from another:

I came back to find myself taken off the salary list and my wages cut. . . . I felt myself going backward and found it impossible to live on what I was receiving, and so I left. I went into housework with the idea of saving my wages, which are practically clear, and entering a hospital for training as soon as possible.

Another writes:

When I came back from the summer school I had lost my job because it would not wait for me for two months. After a couple of weeks hunting for work in different lines and shops, I finally one morning came to a firm that needed some one to do the part of the work that I had always done. It was a non-union shop. I was asked where I worked last. "I didn't work this summer. I attended

the school at Bryn Mawr College," I replied, so as not to give any particular firm. I knew they wouldn't hire a union member. Then I was asked, "What were you studying?" as if they were afraid that I might soon finish for some professional work. "Oh, nothing for a profession, just for general education," I assured them. "Then it's all right," I was told, and I was hired and led into the factory by the forelady. She showed me a machine, gave me some work, and walked off. "Hello, Rose!" I suddenly heard a voice opposite me. When I looked up, I saw a girl that I knew. "Hello!" I answered, and we spoke about different little things. Then she went over to the forelady, and in the meantime I remembered that this girl once came before the executive of our local under a charge of working in a shop when the people of that shop were out on strike; and she was fined by the executive. And I thought, "I wonder if she'll tell that I am a union member." Later she said to the manager, "Rose Ingber never comes to a non-union shop to work; if she comes, it is with the intention to organize that shop. Isn't that so, Rose?" she asked me. I thought that I would be discharged the next moment; but no. This firm seemed to realize that at this time there was nothing to fear from the organization. I am still in this shop, but working very little because there is little work.

Many gave accounts of simple services that they have performed since they returned, speaking, helping to strengthen their unions, attending evening classes. Here is one incident:

This past week I have been taking blind folk on shopping trips, and I have been accompanying a blind friend of mine who is employed by the State Commission for the Blind

in taking the census of the blind. These excursions take us into the poorest sections of the city. We are confronted with crowded tenements, poorly ventilated, hallways reeking of odors and enveloped in darkness. It simply overwhelms one. More and more was I brought to realize of what little avail ultimately are emergency remedies, and that fundamental changes must be made.

Here is a movement which needs to be studied and guided. There are many thousands of eager men and women of

great potential force and intelligence in the working class of America who can be molded into a leadership of enormous value to industry and to the country. They are ignorant now of many things. But they have "a living experience; highly sensitized by economic wrong." They believe that the existing competitive system has worked much injustice to their class. They are suspicious of the system. They fear and hate it. They are inclined to believe oftentimes that human society, as at present organized,

has set its face against them. They are now issuing a challenge to American education. It remains to be seen whether American education is able to meet the challenge and to lead them in an atmosphere of sympathy to think clearly and to see that the way out is not through revolution or despair, but through progressive and intelligent change of the existing economic order until it becomes far better fitted than it now is to support the livelihood and the faith of the children of men.

THE GIRL AND HER MUSCLE

BY CHARLES K. TAYLOR

Photo by C. K. Taylor

A GIRL WHO SCORED ONE HUNDRED PER CENT

ONLY a few years ago one would have said, "A girl and her muscle? How absurd! What has a girl to do with muscle?" And not many years before that a muscular girl, with good posture and shoulders, would have been thought deformed. Now it is perfectly true that girls with a good posture are not nearly as common these days as they should be, but the Posture League has been educating many of us, so that when we see girls with the usual slouching posture we no longer believe it to be natural, but something acquired in school or adopted as a pose.

Here is a story that is perfectly true, though you would not believe it if we produced a wilderness of witnesses. It happened a number of years ago, when the writer was an assistant in a psychological clinic. It seems that the clinic had been particularly successful in the case of an habitual truant of thirteen—a fine-looking boy, too, with perfectly normal mentality. Many bad teeth, however, combined with bad adenoids, were driving him to distraction, so that it is a wonder that he was no worse than a truant. The physical difficulties being removed, the boy forgot all about his trancies, and became a self-respecting member of the community.

His mother was delighted, and developed an amazing faith in the powers of the members of that clinic. Said she to the writer: "I wish you would take a look at my daughter. I'm afraid there is something the matter with her back and shoulders—some kind of malformation."

She was told to bring the child. When they arrived, the writer concluded that he had never seen a girl of twelve with a better posture. She was a well-set-up youngster, no matter if her clothes were really disguising a malformed back.

"She looks all right," said I.

"Oh, yes, she looks all right," replied the mother, "but her back and shoulders don't look right." When these two essentials were made visible, the writer told that mother that for the life of him he couldn't see a flaw. There was no sign of curvature or other fault. The

shoulders were perfect, and much better muscled than usual.

"Mary," said the mother, "put your hands behind your head." Mary did—and you never saw such muscles in your life, appearing on the back and shoulders of a girl of twelve!

"Why, what's wrong?" I demanded. "That's the finest back I ever saw!"

"But isn't something wrong?" asked the mother, anxiously. "Girls' backs don't look like that!" And there you have it. That girl had a first-class muscular development, and her own mother thought something was wrong!

That was about a dozen years ago, and even in these few years so great an interest has been paid the physical training of girls that the girl with first-rate physique is no longer a rarity, and a girl can walk the streets with head up, shoulders back, and with a real capacity for using her muscles in all kinds of emergencies without being thought a curiosity.

Now, when more and more attention is being paid to the physical training of girls, a question arises of increasing interest and importance. Here it is: How are you going to tell when a girl is well developed? An expert can make a shrewd judgment; but can a fair judgment be made by means of physical measurements? And that is the subject of this paper.

First of all, she will have to be judged according to her own type of build, provided that she is in a good physical condition. This is something that can be learned only through a medical examination. As has been said in a previous issue of *The Outlook*, you cannot tell a child's physical condition through his or her weight. We need not go into all that detail again. Let us say that the medical examiner has found the girl to be in first-class condition. Then we can consider that her weight is correct and that she probably represents her normal type of build, which may be slender, or stocky, or some type between the two.

It is obvious that the requirements of a normally slender girl should be proportionally less than those of a thick-set, stockily built girl, and so tables have been devised—five of them—allowing for various types of build. When you have the girl's height and weight, you may find approximately the same height-weight combination on the tables, and there will be given approximate measurements for a satisfactorily developed girl of that height and weight. So far we have followed the general plan as previously described for boys, but with girls we have a complication that makes it difficult to arrange satisfactory tables. A girl five feet tall, let us say, and weighing one hundred pounds, may be pre-adolescent, adolescent, or post-adolescent. This is something her age will not tell either. Therefore tables prepared for pre-adolescent

MEDIUM-SLENDER TYPE

A girl of twelve with score of 118. At ten the score was 82. She then had a lateral curvature of an inch, and badly undeveloped chest and muscles. The measuring and scoring process brought about such an interest that home exercise alone, with frequent reporting for examination, straightened out the curvature, developed a fine lot of muscles and a chest expansion of 3½ inches

girls will not do for post-adolescent ones. The type of build has markedly changed. By way of example, let us compare the measurements of pre-adolescent and post-adolescent girls of the medium type of build and 60 inches-tall. Here they are:

	Pre adolescent.	Post adolescent.
Height	60	60
Weight	92	93
Shoulder girth	32½	33½
Chest girth (ninth rib)	22¾	23¾
Chest expansion	3	3
Right upper arm girth	8½	8¾
Difference when contracted	1¼	1¼
Left upper arm girth	8¼	8¼
Difference when contracted	1¼	1¼
Waist	23	23¼
Hips	30¼	31¾
Average of thighs	16¾	17¾
Average of calves	11¾	11¾

With the post-adolescent girl, then, the measurements must represent the characteristics of the more mature type

of build. Such a mass of data is required to construct thoroughly accurate tables of measurements covering such a variety of types that, though the tables described in this article are actually working well, they cannot be considered perfect. Nevertheless they can, perhaps, be a help to physical directors and examiners in gaining an idea as to the muscular development of a girl compared with an attainable standard.

From these tables scores are obtained after the same fashion as with those prepared for boys. That is, when you have the complete measurements, they are compared with the measurements given for approximately the same height-weight combination and for the same stage of maturity as nearly as may be. Then, as the girl's measurements go below or above the standard, points are subtracted from or added to 100. The following will be an example. The first series are the measurements of a pre-adolescent girl, and the second are those given for approximately the same height and weight for pre-adolescent girls in the standard tables by which the development of the girl is to be judged.

	The Girl	The Standard	The Score
Height	58½	58	
Weight	78	77	
Shoulder girth	32	31½	+2
Chest girth (ninth rib)	21¼	21½	-1½
Chest expansion	2½	2½	-1
Right upper arm girth	8¾	8¼	
Difference when contracted	1¼	1¼	+1
Left upper arm girth	8¼	8¼	+½
Difference when contracted	1¼	1	+2
Waist (not counted in score)	22	21¾	
Hips	29	28½	+½
Average of thighs	16¾	15¾	+2
Average of calves	10½	10½	
Score			105.5

(For shoulder girth, chest girth, arm girth, and calf girth ¼ inch = 1. For arm "difference" and chest expansion ½ inch = 1. For hips and thighs 1 inch = 1. Thigh and calf scores counted twice.)

105½ is a good score. City public school average is about 92. The tables, in other words, contain measurements that are a little above the average. The average is not necessarily an ideal! In making up these tables measurements were used only of individuals in good condition. That makes them rank above average, for the average includes all individuals.

Let us see what can be done with a plan of this kind. First of all, as we said, a girl can be given a score that will represent a fair comparison between her muscular development and an attainable and satisfactory standard for the same type of build, and the record, as shown above, will indicate by minus signs just where special exercise will aid a girl to get rid of under-development. Not only so, but through a method of this kind actual improvement can be distinguished from mere growth gains. Far too commonly increases in weight and height have been termed "improve-

These tables are published in "Physical Standards for Boys and Girls," Academy Press, Carteret Place, Orange, N. J.

ment" and much credit taken thereby. With this plan, if a girl is heavier and taller at the end of a certain period, then all her other measurements must have increased in proportion if she is to maintain her first score. But if the score has increased, then some or all of the other measurements must have increased beyond what was necessary to maintain the first score, and so we have a real improvement noted, by means of which you can check up the value of a system of physical training.

Few seem to take into account and to utilize the great interest aroused both

with girls and boys by the simple process of being measured and given a comprehensible "score." And this interest can be sustained by very stimulating competitions—competitions for highest percentage of improvement, which gives the best chance to the poorer physiques, and one for highest score, which gives the best chance to the stronger girls. Both competitions thus interest every girl, the strong ones having slim chance in the improvement competition, and the poorly developed girls having even less chance in the high-score competition, so that both kinds bring in all girls.

During the year, at frequent intervals, girls who have made "minuses" can report and see if they have made them up, and it has been found that the interest is sufficiently strong to induce many boys and girls to do their special work at home.

During the last few years we have been over-emphasizing the weight of a child and neglecting the muscular development. The writer merely suggests the above plan as a means for stimulating an effective interest in this development and for keeping comprehensible records.

THE DUEL

BY HAROLD TROWBRIDGE PULSIFER

ONCE I fought a shadow
In swift and gallant play.
She laughed at thrust and parry,—
That dancing wraith of gray.

Our flickering sword blades circled
In whirls of phantom light.
It was a high adventure
With such a ghost to fight.

At last, too blindly lunging,
I passed her flashing guard
And pierced her misty bosom
With my impalpable sword.

The ways of air-born women
I do not understand,
Nor how that wounded spirit
Left blood on my sword hand.

THE FUNCTION OF THE CHURCH IN MODERN LIFE¹

BY RABBI SAMUEL SCHULMAN, D.D.

THE fact that I am here this afternoon leads me to believe that in choosing the topic, "The Church in World Affairs," for discussion the club intended the word "Church" to be understood in its most comprehensive sense. We are not here to discuss the dogmas of any particular Church. We are not to emphasize denominational distinctions. We are to attempt to understand what influence the Church, as the visible expression of religion, can exert in the world.

By the Church I understand, first, that invisible but actual union of spirits in the world that are bearing witness to the reality of God and that, in their way, are promoting his kingdom of righteousness and love in the relations of men. Such a union has always existed, and is a tremendous power for good in the world. And again, by the Church one may understand the visible

organized effort of a group of men and women bound together on behalf of the great purposes of the invisible Church in accordance with any particular belief. Thus there is one invisible Church which breaks up into a number of concrete competing and co-operating churches.

I come here to speak as the representative of what I sometimes like to call the Mother Church of Western civilization. Give me the pleasure of indulging myself in the claim, even if you are inclined to criticize the implication in it. The claim is based on the indisputable fact that what actual religion exists in the Western world today can be traced back historically to the religion of Israel as the womb from which it sprang. It happens often that the children in number and in diversity of talent and in the lustiness and vigor of their self-consciousness are inclined to push the mother into the background. They seem for a while to overshadow

the aged matron. But if she, despite the snows of winter on her head, has spring in her heart and feels an undying youth in her soul, she cannot help being a source of inspiration and of counsel to those who cannot altogether deny their origin. And perhaps it will not hurt them, now and then, to listen to what she has to say.

And it so happens that I come here with the message of the synagogue, which is still ringing in my ears, and which is read this morning in every Jewish place of worship. It is on this Sabbath that the story is told of the first attack made upon Israel by Amalek. And Amalek henceforth in Jewish history has been identified with the principle of evil. And we are informed that there is an everlasting warfare from generation to generation, between the Lord and Amalek. And this Amalek was a power that did not revere God. And he unrighteously attacked the weak and the struggling. And he relied on

¹ From an address at a Saturday luncheon of the Republican Club of New York.

brute force. And if I were to sum up the business of the Church in world affairs, I would say that it is to represent God as against the evil in the world.

The supreme function of the Church is to make the present bearable. Not only bearable, but enjoyable. It is to make men feel the reality of the living God. It is to impress human life with its inherent value. It is to make men feel the realities of the spiritual experience. And therefore it is to make them, by faith, rise and triumph over the hideous realities of evil and suffering in the world. It is to make men calm and serene and strong and courageous and cheerful. It is to imbue men with a confidence which will enable them to accept the universe and life. We are living in a fevered time. Western civilization as a patient has not yet recovered from the terrible catastrophe which came to it. It is still being tossed to and fro on its bed of suffering. It is sick from head to foot. There is a maddening fever in its blood. And therefore most of the functions of the body politic are deranged. It is a time of unsettlement. Our institutions are rocking. There is widespread discontent. There is antagonism of races. There is conflict of classes. The attention of men and women is mainly centered on the worldly prizes. Men are fighting for the distribution of the industrial product. Their happiness they interpret in terms of money gained and pleasures that money can buy. In such a time the supreme function of the Church, which is its business in every generation, is to bring home to men's minds a true valuation of life. Men and women must be made to understand that there is something in man greater than the tool which he wields, the things that he makes, the power that he achieves, expressed in terms of the money that he owns and the commodities and luxuries with which he can surround himself as the symbols of his power and self-indulgence. It is the Church's business to make men feel that the glories of life are to be found in the soul. The Church, to use the expression of a significant writer, is to "release the soul" in men and to make them feel that the bit of life which is theirs, the present, no matter where they may find themselves, has infinite value, because it is the fruitage of the marriage of their spirit to the everlasting God. Led by the mystic influence of the Church, they are to transcend worldly distinctions and to realize the worth and dignity of life.

This living faith, if the Church could imbue men with it, would prove a tremendous asset in world affairs. It would bring calm to the fevered brow of the Western world. It would plant contentment in human hearts, a contentment which is no contradiction of a divine discontent, which aims at the world's improvement. It would not be a contentment that would act as a narcotic, to put to sleep our moral energies, but it would be a fountain of living

waters, bubbling up in the heart and giving joy even amid the labor and the suffering that accompany life. It would enable the modern man to echo the spirit of the ancient psalmist, who said, "As for me, the nearness of God is a good."

We have recently heard much of controversy about evolution. I think the Church can and must go beyond such controversies. Let science have to do with methods and processes of the creative power. The Church's business it is to make men feel that they are as much living souls as were the prophets and heroes of the past, and that the religious problem is a perennial one, fresh and new in every generation, for each individual soul. Why should I be worried about my family tree? What do I care for the manner in which the creative wisdom thought fit to have me at last appear on the scene? What is most important is that I feel the inrush of the divine life in my soul, in the present. We need not fear that the scientists will make monkeys of us. The great danger is lest we make monkeys of ourselves by abdicating the glorious privilege which is ours, to revere the Almighty Power and to love the living God, who speaks in the splendors of nature and in the greater splendors of the revelations to the human spirit. The Church must make man happy in the consciousness of his prerogative as a living soul. The Church must give the spiritual foundation to the political creed of a democracy which without that foundation tends very easily to become one of the multitudes of idols after which men went astray.

The Church must not only make the present bearable and acceptable and illumined with joy, but it must lead men with a great vision. It must make them feel that the kingdom is not yet realized, that "the best is still to be." It must be the living conscience, fearlessly denouncing unrighteousness wherever it may raise its head. It must not be afraid of corporate wealth. And it must not truckle to the spirit of any class. It must be quick to sympathize with suffering. Its business is to be the prophet, daring to say to the king of the generation, "Thou art the man." It must be the inspiration to progress in social justice. It dares not compromise. Its sight must be sharp for the evils of injustice that thrive. Its word in denunciation of them must not be faint-hearted. It must recognize that this world is still incomplete and imperfect. The righteous will of men must be fostered by it, so that, to use an expression of the Talmud, men must become creative partners unto Deity in performing the moral commandment of righteous duty and helping along the evolution of man. The Church must be the tribune of the masses whenever and in whatever form they are oppressed by any kind of the classes. In short, the Church in world affairs must be socially progressive. That does not mean that

it must necessarily engage in politics. The spirit of our institutions, which separates the Church from the State, is sound. And the counsel implied in that spirit is one to follow to the extent that it is, on the whole, best that the official leaders of the Church engage not in the machinery and in the methods of political controversies. But the Church must be the great inspirer of the ideals of social justice, of righteousness and love among men. If the masses felt that the Church was performing the function of the prophetic watchman, they would instinctively be drawn to it. A prophet, however, fears no one but God. The Church, therefore, must neither timidly flatter the exploiter nor bend before the fury of the demagogue. The Church must be the prophet, pleading for justice as the goal in human society and using the methods of loving-kindness in leading men to that goal.

The Church must not only mystically transfigure the present, prophetically envisage the future, but it must be the peace-loving priest that conserves what is best in the past and that conciliates classes and races.

This rôle of peace-maker the Church is especially called upon to play in our time. It can exert a tremendous influence in world affairs on behalf of peace. But in order to do so it must be vividly, yea, burningly, conscious of the deepest causes of war. And one of the deepest causes of the spirit of war is the antagonism of races. We have never had in the world's history such an intense racial consciousness as exists to-day. It is this consciousness of race, artificially fostered by a one-sided natural science, which expresses itself in national chauvinisms. It is this which makes the world bristle with prejudices, with antipathies, with vanities, and with tribal animosities. It is not the business of the Church, certainly, to foment and increase them. In the name of the unity of the divine spirit which is reflected in the souls of all men, made in God's image, it is the business of the Church to denounce savage race hatreds, to criticise and condemn even the pettiest manifestations of racial prejudice. Never can it be the function of the Church to urge men to war. It may encourage them, when in war, by the appeal to their sense of the nobility of duty and the sublimity of self-sacrifice. But unto the very end the Church must dissuade from war and be inexhaustible in searching for means of reconciliation. Always it must speak for peace. Never must it indulge the Amaleks of the world in their race hatreds, in their unrighteousness, and in their blasphemy of God, by their reliance upon brute force.

The Church is the soul of the world. It is influencing world affairs all the time in so far as it is influencing human souls. Its responsibility is tremendous. To criticise it is easy. Its mistakes are the result of human weakness. By its ideals humanity lives and progresses and grows in insight.

A MERCHANT WHO IS LOSING \$50,000,000 A YEAR

HOW ALBERT D. LASKER, CHAIRMAN OF THE UNITED STATES SHIPPING BOARD, IS TACKLING THE JOB OF "SELLING" TO THE PUBLIC AND TO CONGRESS THE ADMINISTRATION'S UNIQUE SHIP SUBSIDY PLAN

BY NEWTON FUESSLE

ATALL, ruddy-faced, vivacious Chicago man has shouldered one of the heaviest loads of the Harding Administration. His gait is untinged with the rolling leg manners that betray much contact with slanting decks, and yet he has been intrusted with the destiny of the Government's enormous fleet of 1,442 steel ships. He walks with the jaunty, confident stride of Michigan Boulevard, but there aren't any traces of over-confidence in his bearing. For he has bitten into one of the toughest jobs that ever confronted a Presidential appointee. His name is Albert D. Lasker, and he is Chairman of the United States Shipping Board.

Prior to being called to Washington Mr. Lasker seems to have made money out of every project that he laid his hands on. And now, for the first time in his life, the project that crowds his attention is losing money head over heels. It is going in the hole at the rate of \$50,000,000 per year. And this \$50,000,000 annual loss does not include interest, full insurance, or depreciation on invested capital.

President Harding has intrusted Chairman Lasker with the job of "selling" Congress and the public on the necessity for ship subsidy instead of Government operation of this big and embarrassing fleet that was left on our hands after the World War. Mr. Lasker is obliged to "sell" an idea and to "sell" goods as no Government official ever had to sell anything before.

Rusting in the waters of the Hudson and the James, lies no small part of this cumbersome and bewildering armada. Happily, Mr. Lasker is an expert at creating demand for merchandise and inventing methods for the efficient distribution of the fruits of mass production. He brings to the present task a sense of searching analysis, a gift of articulate expression, and a singular ability to move goods out of warehouses and off the shelves and into the hands of consumers. For years, as the head of Lord & Thomas, he has directed many of the largest and most important advertising and sales campaigns.

Under the gilded arches, French mirrors, and ornate crystal chandeliers of one of the Senate committee rooms in the National Capitol the Government's ships have recently been under prolonged discussion. Round the long council table of the smoke-filled room sat the members of the Senate Committee on Commerce and the House Committee on the Merchant Marine and Fisheries. At

ALBERT D. LASKER, CHAIRMAN OF THE UNITED STATES SHIPPING BOARD

one end of the table were grouped Chairman Lasker and his experts. The hearings were on the Administration's bill for a ship subsidy.

Lasker, in his opening statement, expounded the unique story of the fleet of ships that we don't know what to do with, and then he proposed a remedy. He replied with ready knowledge and brisk and pointed gestures to the bombardment of cross-examination. It was the usual character of Congressional cross-examination; some of it was statesmanlike, and some of it was fatuous and partisan and nonsensical.

It is not likely that, as the executive head of a large advertising firm, Mr. Lasker has had time actually to write much "copy." But he demonstrated during these hearings that he has not lost his cunning as a producer of effective advertising. His formal opening statement was a piece of consummate "copy." It was fifty-nine typewritten pages in length, and presented an engrossing argument for ship subsidy, and called upon the "consumer" in persuasive language to avail himself of these advertised "goods."

BUSINESSLIKE AS DETROIT

For fast work or overtime efforts Government employees in Washington are not exactly noted. The bulk of them just about keep moving. But there is a very different atmosphere in the long, low office building of the United States

Shipping Board and Emergency Fleet Corporation. It is charged with an electric quality. The enormous building looks more like a vigorous Detroit motor plant than like Government buildings generally. One enters a door marked "The Chairman," and discovers a plain, barely furnished anteroom, entirely free from the impressive appointments of other Government offices. On the floor are broad strips of grayish-brown battleship linoleum. There are several plain yellow desks, a few chairs, a metal clothes-press, and some hat-and-coat trees. Here are only the bare necessities of an office. It is literally stripped for action. Its job is one that all concerned want to clean up in a hurry and be through with.

An amazing bookkeeping chaos appears to have swamped the records of the Shipping Board and Fleet Corporation before Mr. Lasker took charge. Great quantities of materials had been moved from place to place without adequate notifications reaching the inventory records. To one warehouse alone 36,000 items were delivered without proper manifests and documents; there was no trace of the origin and cost of these items. And this is merely one example of the general disorder and confusion.

As an example of the immense effort required to reduce the confusion into a semblance of order, the work at Hog Island alone involved physical counts of materials and supplies of 125,000 different characters, comprising millions of units, and the final inventory report of Hog Island consisted of 11,000 typewritten sheets.

The collapse of intrinsic values since the armistice that Mr. Lasker has to contend with is appalling. A condensed summary of one group of properties and materials shows a cost of over \$317,000,000, with a present fair value of about \$70,000,000, and a forced sale value of only \$31,000,000.

The president of one ship operating concern recently dropped into Washington and urged a settlement with the Fleet Corporation covering matters antedating the present Board. His company had charges against the Fleet Corporation and admitted obligations to the Fleet Corporation. Days were spent in searching for all possible debits and credits. After all of the accounts were gathered from all available sources, it appeared that as a net result the Fleet Corporation was indebted, according to its books, to this operator for about

International

SHIPPING BOARD VESSELS LYING AT ANCHOR IN THE HUDSON RIVER NEAR JONES'S POINT DURING THE WINTER OF 1921-22

\$800,000, whereas, according to the operator's own admission, his company owed the Fleet Corporation \$250,000.

These instances disclose something of the voluminous muddle that faced the Chairman of the Shipping Board when he assumed control of this gigantic enterprise with the task of converting the American people to the idea of a practical ship subsidy plan.

AMERICA SUSPICIOUS OF THE WORD "SUBSIDY"

The word "subsidy," moreover, is generally regarded with inherent suspicion by the American mind. And in order to overcome that suspicion Mr. Lasker has patiently embarked upon a broadcast educational campaign that aims to impress upon the public and its Congressional representatives the changed economic conditions that require new measures. Mr. Lasker holds that, although the Republican Central West has ever joined with the Democratic South in distaste and revulsion to subsidizing our shipping, the present need is an all-American one, and should be treated as non-sectionally and as non-politically as the needs of the Army, Navy, or Post Office Department.

"Prior to the great World War America was content to have its cargoes carried in foreign bottoms," declares Mr. Lasker. "We were a debtor nation, and felt sure that those whom we owed, being the great maritime nations of the world, would furnish us the bottoms with which to carry the goods to liquidate our debts. But the World War has changed practically every phase of human life. America emerges from that war holding first economic place in the world. She finds herself a creditor nation instead of a debtor nation; and, whether we will it or no, we are now cast for continuing first place on the stage of world commerce. No nation ever held that position unless she was strong in her own rights on the seas. It is for us here and now to determine whether America shall attempt to refuse

the place which destiny has carved out for her."

UNCLE SAM'S COMPETITION DEADLY TO PRIVATE SHIPS

When the Government undertook to sail merchant ships and to build up trade routes, its motive was solely to bring about conditions under which the ships on its hands could be sold with established good will to private owners. But the result, Mr. Lasker told me, has been exactly the opposite.

"The very method chosen has worked to defeat its own purpose," he said, "for in the upbuilding of those routes the Government has operated ships, and in the operation of ships has driven its potential customers largely off the seas. Thus we come to conclusions from which there can be no escape—that, since continued Government operation means finally the possible and likely elimination of private operation of American ships, a method must be devised whereby the Government shall end its operation and at the same time insure carriage of American goods under the American flag through private ownership as contemplated by the Jones Act.

"Europe owes us, governmentally and privately, some fifteen billion dollars. To pay in gold is impossible; there is not that much gold in the world. Europe can pay only in raw materials or in manufactured or partly manufactured wares. In turn, we must find new markets, not only to absorb the surplus products which Europe formerly took from us, but to provide for the sale of many of the products which Europe shall send to us in settlement of her debt. These products, if in raw or partly manufactured state, will be completed by American labor; but if permitted to flood our own market, and if we do not find a foreign sale for them, will so depress the price of wares at home as to threaten the prosperity of all of our workers.

"These newer markets lie across the ocean; and it is for these very markets

that the nations of Europe which owe us vast sums of money will contend with us. And who can be so blind as not to see that Europe will very properly in her own interest find the ways and means to refuse us ships when we need them most, if that refusal spells her control of markets in which we would compete with her for mastery?

"There can be no return to a pre-war basis. Increased overheads through increased capacities demand increased consumption in many lines beyond that which can be found in our home country. The debts Europe owes us, their enforced economy for decades to come, and consequently finally diminishing purchases from us, all combine to require our search for new markets. These markets will inure to us only when sureness of delivery, regularity of sailings, and promptness of service from our ports to theirs are guaranteed."

A MONUMENT TO FOLLY

The Lasker programme concerns itself only with the correct balancing of the Government's fleet of steel ships and the reconditioning and repowering of these ships, and in some cases the remedying of structural defects. This job can be done at an estimated cost of about \$25 to \$50 per ton. The vast number of tons of wooden ships Mr. Lasker dismisses with the statement: "They never should have been built; they were the war's greatest shipping blunder, an error against which we had been warned, but which warning we refused to heed. They must be charged off practically as an entire loss, a monument to folly. They cannot be used in profitable normal operation, and merely hang over the market as possible pirates in times of better days, depressing thereby the potential value of the steel fleet without offering the slightest hope of continuous operation even for short periods. The high cost of insurance, the uneconomic machinery, the great amount of fuel required in proportion to carrying capacity, make these ships in every way

(C) Marine Photo Service

A DECK SCENE ON A SHIPPING BOARD PASSENGER VESSEL

Thought is given to the wee travelers in providing them with a sand-box

impossible. They should be considered as not existing.

"In passenger tonnage, both Governmental owned and privately owned and including ships designed for the short runs to the West Indies, we have but 80 good ships, aggregating 600,000 tons; while of fast cargo ships of both classes we have but 53 ships of 390,000 tons. To have a merchant marine that can effectively meet fifty per cent of all our peace-time carrying needs we require 1,250,000 gross tons of passenger ships and about the same amount of the faster cargo ships.

"Of our 6,000,000 tons of freighters, about half the steel tonnage is good tonnage, comparable to the best in the world. The other half ranges from fair to not usable for our purposes, and should be either sold abroad in such trades where we have every assurance it will not find itself in competition with our ships or dismantled. We must not fool ourselves."

CALLS GOVERNMENT OPERATION
"INHERENTLY VICIOUS"

How are we actually faring in our competition with other nations in carrying ocean cargoes to and from American ports? Mr. Lasker tells me that last December, which is considered a normal recent month, foreign ships carried 76 per cent of our overseas general cargoes, while only 24 per cent was carried in American ships, of which 19 per cent was carried in Shipping Board vessels, and only 5 per cent by private American ship-owners. It is Mr. Lasker's aim, and he considers that the aim can be accomplished, for privately owned American ships within the next decade to be carrying at least 50 per cent of our foreign

trade, other than with contiguous or near-by countries.

Chairman Lasker bluntly declares that Government operation of merchant ships is inherently vicious. When he took office in June, 1921, he found the ships of the fleet being operated by managing agents—that is to say, by private operators who received from 2½ to 5 per cent of the gross receipts for supervising the operation of the ships.

"This system," he declares, "is uneconomic and vicious, for the reason that the managing operator, having no direct interest in the operation of the ship, having no direct responsibility, having no sense of building for himself for the future, is in such state of mind that he operates Government-owned ships with vastly different vision and inspiration than he would his own.

"The system was open to all sorts of vagaries in management, to all kinds of chicane and unreliability. The managing operators had organized private stevedoring companies, private shipchandling companies, and similar devices by which to make hidden profits, to increase the meager compensation which the Government allowed them. The very spirit of making hidden profit on the part of an agent to a principal means a strained relationship all along the line. Such attitude and actions on the part of the managers were known to the captains and crews of the ships, who, in turn, felt neither pride nor proper responsibility in their trusteeship.

"Yet the individual agent cannot be chargeable with the fact that initiative and sense of responsibility are lacking in the transaction. It would be impossible. It is not within human realm to

create in such a transaction a sense of initiative and responsibility. The only reason that the managing operator continues in his connection with the Board (and I think I speak the view of the managing operator that he believes as little in the system as any one) is that he hopes by co-operating with the Board in the management of the ships to keep alive America's merchant marine until Congress can adopt a National policy that will insure its life. The managing operator, strange as it may seem with the charges that are made against the system, is performing a really helpful service."

Mr. Lasker states that the defects of the system, so far as possible, have been eliminated; but that conditions are still basically bad, and will remain bad so long as Government operation continues. He points out why Government ownership of ships cannot possibly work out successfully.

"If the Government wanted to take over the railways," he explains, "it would create a monopoly which would give exclusive privilege to Government operation until such time as efficiency might be brought into life; but shipping is a different thing. The Government must always compete with the world's privately owned shipping. No monopoly can be created during the existence of which efficiency can be brought to life, and in the competition between Government ownership on the part of our Nation and the initiative and sense of responsibility due to private ownership in others failure is certain."

The efforts of the Shipping Board to place vessels in private hands on a bareboat charter basis have been indifferently received.

"With world shipping depressed beyond anything ever known," explains Mr. Lasker, "with the fear of competitive Government operation financed out of the public treasury, with the bugaboo of a vast unliquidated Government-owned tonnage hanging over the market, charterer and buyer alike have become timid and find no incentive for risk. It is a drab picture, but we can only look forward to benefiting from the advantages of improved world trade conditions when they may come by now putting our house in order to transfer our operations and our fleet into private hands."

PRIVATE OWNERSHIP OR BANKRUPTCY

"There is no future for the American merchant marine, private and Government, save bankruptcy, unless private ownership is fostered and expanded and the Government retire," contends Mr. Lasker. "We can no longer procrastinate. The Shipping Board's loss of \$50,000,000 a year can be ended by a much lesser expense from the Treasury, through the direct and indirect aids proposed, and only in this way can the Government's good ships find a market by making private operation profitable. As quickly as possible the good ships

should be liquidated, the poor ships disposed of, the Government put out of operation. The President's proposals contemplate that at an ultimate maximum expenditure of \$32,000,000 per annum in direct aid, and through various forms of indirect aid, we will finally dispose of our ships for private operation, at a total annual cost of something over \$40,000,000; and thus shall we end an operating loss of \$50,000,000, and give our people a better and a more assured service on the seas than America has ever enjoyed heretofore, successfully turning a war-time and war-built enterprise into a great instrument of peacetime profit and peace insurance.

"Private ships under the American flag must be Governmentally aided, because of the higher standards of living of American labor in the shipyard and on the ship," continued Mr. Lasker. "The man who builds ships on land works in America with a higher wage; the man who mans our ship is paid more and sustained better than the foreigner. Who in America would have it different? Who in America would question that the prosperity of one should be the common prosperity of all, and that these higher standards should prevail with all the people of our country?"

TERMS OF SUBSIDY PLAN

After a careful study of both the successes and failures of direct aid to private shippers on the part of other governments, the Shipping Board has caused a bill to be introduced in Congress which proposes definite Governmental aid to private shippers. The terms of the proposed subsidy include cash compensation to shippers, together with every practical indirect aid possible to give.

Discussing some of the features of the proposed subsidy bill, Mr. Lasker said: "This legislation proposes a very proper limitation—ten per cent on the earnings of ships, and after that equal division of earnings between the owner and the Merchant Marine Fund until the subsidy is returned. Surely, such an allowance of earnings cannot be called profiteering, because, while the ships are allowed a net profit of ten per cent before beginning to return the subsidy, and thereafter are allowed half the net profits until the entire amount of the subsidy is returned, nowhere in the Shipping Board study is it proposed that ships be protected against loss. Under the proposal made, including the right of the Shipping Board to make ten-year contracts, there will be many years during which, with all the aids given, ships will lose money, and it is universally conceded that in the shipping business, through the years of plenty and years of famine, the average that any ship can earn through the proposed Government aid during the term of its ten-year contract is a very modest sum.

"There is no hope of the establishment of a merchant marine through insufficient aid. Rather than insufficient

A "535" TYPE OF VESSEL ORIGINALLY DESIGNED AS A TRANSPORT BUT COMPLETED AS A PASSENGER AND FREIGHT SHIP BY THE SHIPPING BOARD

This type of vessel is operated to South America, to Europe, and to Oriental ports. The vessels represent the last word in safety

aid let us have no aid at all. We must do enough or nothing. To do less than enough is merely to have sold out to the defeatists who would have no American merchant marine. But we should yield nothing to possible profiteering. The Shipping Board stands boldly in its affirmation that its study and its proposal, unique though it is, would accomplish these purposes.

"It is asked that the Shipping Board fleet be sold at world prices, regardless of cost of construction. The cost of construction is a war cost and should be written down to zero. Whatever we get out of the salvage is a profit."

A construction loan fund not to exceed \$125,000,000 is proposed, the same to loan funds at interest rates as low as two per cent, to not more than two-thirds of the value of the ship. There is also an income-tax relief provision. Regulations are proposed that would insure to American-flag passenger ships at least fifty per cent of the immigration coming to this country. "Had such a provision been enacted during that pre-war period, when immigration was at its height—1,200,000 per annum," says Mr. Lasker, "and had half of that number of immigrants come in American-flag ships, the Shipping Board believes that, instead of having only fifteen passenger ships under the American flag in 1914, in the North Atlantic at least we would have had as many passenger ships of the third-class type as any nation in the world, Great Britain not excepted."

Subsidized vessels may be taken and purchased, or used, by the Government at any time for the National defense, according to the proposed legislation. All repairs or reconditioning, so far as possible, must be done in United States ports. The vessels shall carry United

States mail, other than parcel post, free. Rail and water transportation are to be fully co-ordinated.

The direct aid is computed on a differential based on a combination of speed, tonnage, and distance covered, starting with a half-cent per gross ton per one hundred miles steamed in the foreign trade for ships under thirteen knots, and increasing to a total of 2.6 cents per gross ton per one hundred miles steamed for ships of twenty-three knots and over. It is estimated that in order to develop a balanced fleet of 7,500,000 gross tons, which should carry fifty per cent at least of all branches of our overseas trade, the cost to the Treasury will ultimately approximate \$30,000,000, though for the first year it is estimated that the cost will be only \$12,500,000. Contracts shall not exceed a ten-year period.

Mr. Lasker points out, however, that even under the most favorable circumstances a ship's fueling alone would cost about twice the sum that could be collected from the Government in cash compensation for any voyage, and that there is no fear that the small amount of the direct aid recommended would encourage inefficient or wasteful operation of ships.

One authority contends that the American capacity to absorb the products of our factories is only enough to pay the overhead expense of manufacture, and that American manufacturers must rely upon exports for their profits. If this is correct, then the Lasker effort to "sell" the Administration's ship subsidy plan to the public and to Congress has this additional impetus behind it. But, whatever happens to the plan, Chairman Lasker holds the distinction of having organized and energized one of the hugest selling plans on record.

THE BOOK TABLE

BY BOOK OR BY CROOK?

BY ESTHER JOHNSTON

"PLEASE send me a Russian book for which I have many longings," wrote Mrs. Razansky, and Yetta, who brought the note, explained that her mother couldn't learn English "by the night school." She was too tired when she got the five children to bed. Such requests and such reasons for not learning English come daily to the library in a foreign neighborhood, while the cry, not a new one, to "make 'em learn English" comes stridently from another quarter.

With the new immigration, based on that percentage system which we Americans are applying to foreigners and intoxicants, books play a part in a better understanding between America and the immigrant. The immigrant has made his contribution to that understanding by making himself articulate in our language through M. E. Ravage, Jacob Riis, and a host of others. Americans have not taken the same pains to make themselves heard and understood in the languages of the foreigners. It is not unusual for the immigrant to appear at the library in a foreign quarter the day he arrives in America. He probably does not yet know English speech. He cannot yet read English books. But he has heard that the library has books in his language, and for that language he has "many longings." Even before he learns our speech, the foreigner makes a contact with a characteristic American institution where, although most of the books are in English, his own language is represented. Yet he will probably look in vain among the books he can read for any that interpret America.

An interest in foreign books brings many immigrants to the library. A desire to read English, while re-reading the books in the familiar native tongue, holds them there. Foreign books are an instance of the interest of the American community in what the immigrants bring with them. Newcomers who are drawn to the library for foreign books rarely leave without an English primer or grammar, and they are the most alert to learn the English language.

No doubt the German *verboten* had much to do with the tenacity of the French language in Alsace-Lorraine. A language thrives under persecution and is killed by kindness. Americans, conspicuously ill at ease with foreign languages, are unreasonably contemptuous of them. A small percentage of the American colony in Paris speaks French fluently. Yet the members of that colony are people of wealth, education, and comparative leisure. Since they find it difficult to acquire a foreign language, is it surprising that a tired sweatshop worker "by pants" or the mother of a large family learns slowly?

Long before they read English, immigrants are eager to know of this new and bewildering country. Since they have little direct contact with Americans, they must learn through books and newspapers of American ideas and ideals. Some of the languages of our immigrants are rich in translations of American books. The Czechs have translated many of our classics and have published them in the beauty of Bohemian binding and typography. French, German, and Italian have the many translations that one might expect, although not enough for the Continental demand.

Much of our new immigration comes from southeastern Europe, where the customs and thoughts of America are less known than in western Europe. Translations into their languages are very sparse. One of the large foreign branches of the New York Public Library which buys all good translations of representative American books in Russian and Yiddish can gather only a meager collection for readers who clamor for more of our books. The novels in Russian now include some of Jack London's, but formerly stopped with "Uncle Tom's Cabin" and "The Last of the Mohicans," from which an ignorant but curious foreigner might judge that we are of two races, the black and the red. The one book descriptive of the country is the tale of Gorky's travels in America. There are no translations of representative biographies.

Yiddish is the foreign language that predominates in New York, leaving its uncouth trace on the accent of New York. However it may assail the ear, it is a medium upon which thousands of immigrants depend.

"I dislike the language," an East Side educator told me, "but I can't let a personal aversion prevent my using it. I dislike the telephone, too; but if I've an important message—if there's something that really must be told—I use the telephone. So with Yiddish, or any other foreign language. If an idea is important, use the language that will put it across."

Presumably there is something important to tell the immigrant. He is questioning and curious about this land of his aspirations, of which the reality is often so disappointing. He wants to know about the America of the prairies and lakes, mountains and desert, so remote from the crowded, jostling Little Italies and Ghettos where he lives. He wants to know of the America of Lincoln and Washington and Roosevelt, of Whitman and Hawthorne, of Sinclair Lewis and Edgar Lee Masters. Yet it is easier for him to learn of the murders and thefts, municipal corruption and

crimes of capital. He who rides on the subway may read of these in every foreign language as well as in English.

A correspondent who crossed in the steerage wrote of the opportunity of the passage for informing the citizen about America. But that information can be given only in the immigrant's language, and the translation of American books into Yiddish has proceeded very slowly. Biographies and histories and novels of American life should be made available. A translation of Bryce's "American Commonwealth" would be vastly more interesting to the intellectual Jewish immigrant than the childish civics books in primer English so often urged upon the foreigner. Lincoln is the hero of incoming Europeans. A translation of Charnwood's "Lincoln," with its wide sweep of American history and politics, would be more acceptable to the average Jewish reader than an English biography written in the first-steps-for-little-feet style.

The foreigner wants his English lessons, and will be driven to get them by self-interest as well as by community interest. He also wants to know more about the spirit of America than he can read after a few weeks of laborious English. Books that combine English and civics are written for foreigners with limited intelligences as well as vocabularies. Well, really, it shouldn't follow that a man must be lectured like a child about his civic duties while he's learning a language.

Recently children in a foreign class were asked to tell their nationalities. One answered that his father was born in Russia but that *he* was anemic. Unhappily, the answer is not as absurd as it seems. Children of immigrant parents suffer from mental malnutrition, from inability to absorb all that is fed them, from growing too rapidly away from the home environment. When parents cannot speak English, they fall in the estimation of their children, who see them unable to cope with their American neighbors. When parents are, in addition, ignorant of American ways and ideals, which are partly interpreted through books, children can impose upon that ignorance a cheapness and aggressiveness which they explain as "American." It is, they point out plausibly, the "greeny" who is courteous and quiet of speech and manner. It is the second generation that suffers most from the lack of understanding between their parents and the New World.

Books, even in the language of the immigrant, are not a panacea for putting the older immigrant at his ease in America. But they are potent in explaining this strange land, so often cruelly different from the land of his dreams and ambitions. Books will put older men and women into contact with a life of which their children, if not they themselves, are to be a part. For

many adults who do not go "by the night school" the foreign newspaper and the cinema are now the only interpreters.

If the mothers could read in the familiar language such books as Alcott's "Little Women," Shaw's "Story of a Pioneer," Garland's "Son of the Middle Border," "Life of Alice Freeman Palmer," Canfield's "Bent Twig," Hawthorne's "Scarlet Letter," they would form a different opinion of American home life and social relations. If fathers born in eastern Europe found the new land interpreted through Charnwood's "Lincoln," Muzzey's "American History," Hagedorn's "Boy's Life of Roosevelt," Roosevelt's "Letters to His Children," Harte's "Luck of Roaring Camp," Clemens's "Huckleberry Finn" and "Tom Sawyer," would they not be more understanding of the citizenship for which their sons are preparing?

During the last few years we have heard much of Americanization—a word

charged with unfortunate implications for foreigners. Before we attempt to make citizens of our foreign-born let us make available to them part of our heritage—the America of the Transcendentalists as well as the America of Main Street, the rough and democratic America of Mark Twain and Walt Whitman, the New York of O. Henry, the biographies of men and women who have made America. A foreign reader who returned an English biography of Roosevelt to the library said that he wished it might be translated to show the nature-loving, outdoor American in contrast to the materialistic American whose undesirable acquaintance the immigrant makes almost immediately.

Certain books have crept into the fabric of our lives and thoughts. Let us urge their translation into the languages of our immigrants, so that foreigners may have a fair chance to supplement the cinema with the earlier and more faithful interpreters of life.

and in theology; "Sun, Moon, and Stars" as objects of worship and wonder in all portions of the globe; "Taoism," "Teleology," "Theism," "Theology," "Theosophy," "Time," "Transmigration," "Universalism," "Unitarianism," "Validity," "Vows," "War," "Wealth," "Worship," "Young Men's Christian Association," "Zionism," and closes with "Zwingli." It covers such unexpected subjects as "Tattooing" (here spelled Tatuino), "Trees and Plants," and "Yawning." The emphasis in this encyclopædia is not upon theology. For example, the article upon "Trinity" is comparatively brief, occupying barely more than four pages; whereas "Taoism," a religious but in the strict sense a non-theological subject, occupies fourteen pages. The twelve volumes constitute a great work of reference—the product of the research of many scores of scholars. In such an encyclopædia as this there is not only technical information for students and users of a theological work for professional purposes, but also a vast amount of curious and interesting information which ought to appeal to a very much wider circle of readers.

THE NEW BOOKS

FICTION

BEST LAID SCHEMES. By Meredith Nicholson. Charles Scribner's Sons, New York. \$1.50.

Good-natured and humorous short stories, among which "The Susinness of Susy" and "The Girl with the Red Feather" are capital examples of the author's vivacity and originality.

KINGFISHER (THE). By Phyllis Bottonie. The George H. Doran Company, New York. \$2.

Jim Barton, a boy convict, then a "hand" on a barge, becomes in time an English university man and is loved by an exquisite, flower-like maiden of the luxurious class. The possibilities of such a situation are obvious and are cleverly worked out by the author of "The Dark Tower" and other popular novels.

LADY BOUNTIFUL. By G. A. Birmingham. The George H. Doran Company, New York. \$1.75.

Canon Hannay, under his well-known pseudonym, tells with gusto these stories of Irish inconsistency, warm-heartedness, and adaptability. Some of them are pure farce, but nearly all are good fun; one only is bitter with the tragedy of factional hate.

LINDA LEE, INCORPORATED. By Louis Joseph Vance. E. P. Dutton & Co., New York. \$2.

A tale of Hollywood and the movie colony.

PIRATE'S HOPE. By Francis Lynde. Charles Scribner's Sons, New York. \$1.75.

A variation of the theme of Barrie's "The Admirable Crichton," with the addition of a buried treasure (two, in fact—one ancient, one modern) and with a clever twist of the plot whereby the hero's plan to maroon his society friends on a desert island to test their character is turned into serious reality.

SUNDRY ACCOUNTS. By Irvin S. Cobb. The George H. Doran Company, New York. \$2.

Readable short tales by an always popular story-teller. They abound in humor and character drawing.

BOOKS FOR YOUNG FOLKS

FRANK OF FREEDOM HILL. By Samuel A. Devieux. Doubleday, Page & Co., Garden City. \$1.75.

The author of this series of stories understands dogs and understands boys. He has made free use of his imagination, and it has enabled him to interpret the unspoken language of the dog without attributing to him a fanciful intellectual life. The stories are vivid without being fanciful, dramatic without being sensational, and sympathetic without being sentimental. They are realism illuminated by intelligent sympathy. They will interest, not only boys, but no less all understanding grown-ups.

TONY SARG MARIONETTE BOOK (THE). By F. J. McIsaac. B. W. Huebsch, New York. \$1.

This small volume, primarily for children, although grown-ups will be bound to find something of interest in it, receives added value from the grotesque sketches by Tony Sarg. The text explains how children may make a marionette set of their own and work it. Added to this are two plays written particularly for marionettes and sufficiently simple to be presented by children. The entire volume is a charmingly conceived effort completed in the most satisfactory manner.

RELIGION AND PHILOSOPHY

ENCYCLOPEDIA OF RELIGION AND ETHICS (THE). Vol. XII. Edited by James Hastings. Charles Scribner's Sons, New York. \$3.

This volume, with the exception of the index volume, completes a work of importance and value to all students of religion and of ethics. As recorded in The Outlook from time to time since 1909, when the first volume appeared, this encyclopædia is comprehensive and scholarly. It covers a field which, so far as we know, is not exactly covered by any other work of its kind. This concluding volume contains such important subjects as "Suffering" (the first article in the volume) as a problem in ethics

CONTRIBUTORS' GALLERY

RABBI SAMUEL SCHULMAN was born in Russia, but has lived the greater part of his life in America. At the present time he is rabbi of the Temple of Beth-El, in New York. He is President of the Central Conference of American Rabbis and a member of the Board of Editors of the English translation of the Bible for the Synagogue. He has been a rabbi in Helena, Montana, and in Kansas City, Missouri. His articles and pamphlets on religious subjects have been widely read.

SENATOR DAVENPORT, by serving as a mechanic in a large Syracuse factory during the summer of 1920, gained a sympathetic knowledge of the American industrial worker and his needs. Mr. Davenport is a member of the New York Senate and Professor of Law and Politics at Hamilton College. His home is in Clinton, New York.

NEWTON FUESSLE contributes an article of importance and special timeliness. Mr. Fuessle made a trip to Washington to interview Mr. Lasker personally, and got at first hand the information contained in this article. The Outlook will publish in an early issue his story of the Government's activities in road building.

C. K. TAYLOR in his article "The Girl and Her Muscle" provides further ammunition for our height-weight controversialists. Still another article from his pen will appear in The Outlook very shortly.

HAROLD TROWBRIDGE PULSIFER is the author of a book of poems published by Houghton Mifflin Company entitled "Mothers and Men."

OPEN MAY 25th TO OCTOBER 1st

Attractive book with beautiful pictures and auto map sent on request, or complete information from all principal tourist agents including reservations. WILLIAM H. WARBURTON, Proprietor.

BY THE WAY

THOMAS LINCOLN and Nancy Hanks, the parents of Abraham Lincoln, were married June 12, 1806, by the Rev. Jesse Head, in Washington County, Kentucky. Little has been known of this hardy pioneer preacher. His grave and that of his wife, Jane Ramsey, have been discovered in a corner of the cemetery in the old town of Harrodsburg, Kentucky. Dr. William E. Barton, author of "The Soul of Abraham Lincoln," through whose effort this discovery has been made, proposes that the grave be now marked with a modest stone before the memory forever passes. No elaborate monument is desired or is desirable, but it is thought that a good many people would gladly give \$1 toward such a memorial. Miss Mary A. Stephenson, of Harrodsburg, Kentucky, is treasurer of the Fund and will acknowledge subscriptions if an addressed postal card or self-addressed stamped envelope is inclosed.

From the New York "Sun:"

"You haven't much space for a garden here, old man."

"I have all I need. You've no idea how much backache you can get out of a few square feet of ground."

From "Simplicissimus:"

"But, papa, why take my debts so tragically? I assure you, by hard work, strict economy, and the utmost self-denial you will succeed in clearing them off."

Can a blind man tell the denomination of bills by feeling them? Probably not; but many sightless persons can count their money accurately. An instance is cited in the "American Magazine," in the case of a well-known blind physician of Chicago, Dr. Robert H. Babcock. He was paying his hotel bill. It amounted to \$9.60. He reached into a trousers pocket. "There's your sixty cents," he said. He then took a roll of bills from his vest pocket. "There," he said, peeling off a bill, "is a five; there's a two; there are two ones. Is that correct?" It was. A man stepped up and said: "Pardon me, sir, but there are several of us gentlemen over here who would like to know how you were able to tell, by the feel, the denomination of those bills." Dr. Babcock did not relish the abrupt question from a stranger. "If any fool tells you," he answered, "that a blind man can distinguish a five-dollar bill from a ten-dollar bill by the feel of it, you can tell him he's a liar!" The fact is that Dr. Babcock remembers the denominations of the bills given to him and puts them in his pocket in a certain order.

Dr. Babcock, the above-quoted article goes on, doesn't like to make mysteries out of the astonishing things that a blind man with acutely trained senses can do. One of his office associates was asked by him one day how a bottle of ink came to be spilled in a closet in his office. The closet was dark, and his

associate had to light a match and get down on his hands and knees to find out that ink had actually been spilled there. The incident puzzled him. A day or two later he said: "Doctor, there is one mystery that is bothering me, and I wish you would clear it up. How in the world did you know there was ink on the floor in that closet?" "Why, there's no mystery about that," Dr. Babcock replied; "I smelled it!"

Great numbers of British war vessels have been junked since the armistice, the "Scientific American" says; a single firm last year bought no fewer than five battleships, twelve cruisers, and seventy-five destroyers in one block from the Admiralty. As a matter of fact, the British market for scrap metals has become overstocked, and 200,000 tons of obsolete British war vessels have been purchased by German firms who needed scrap steel. "Thus, by the irony of fate," adds the "Scientific American," "the British Navy is contributing directly to the restoration of German trade." But the Germans can get no possible warlike utility out of these vessels, for all the guns, ordnance equipment, and confidential instruments are removed before the ship is handed over.

Years ago, says the article quoted above, it was customary to use explosives for breaking up the decks and wrenching apart the stout scantlings of condemned ships, but dynamite has now been superseded by the all-conquering oxy-acetylene torch, which cuts through stout plating like a knife through cheese. Gangs of torch operators swarm over the hull, cutting it down deck by deck. Massive machinery and heavy castings are broken up by the "skull-cracker," a primitive but effective device by which an iron ball, weighing anything up to two tons, is hoisted by a crane to a height of sixty or seventy feet and then dropped with a tremendous impact which splinters the hardest metal like glass.

An unusual card of thanks is quoted as appearing in the Newburgh (Oregon) "Graphic." It reads:

I wish to extend my heartfelt thanks to all those who contributed to the comfort of my brother during his illness and assisted his family in their bereavement; and to all those who profited by their misfortune would refer for consolation to the 14th verse of the 23rd chapter of the gospel according to St. Matthew.

A hospital patient who had to have his stomach washed out with a weak solution of permanganate of potash, a contributor to the Manchester "Guardian" says, chanced to catch sight of the word "Poison" on the bottle. The following occurred:

Patient—"Say, doc, that's poison you're dopping me with."

Doctor (showing label on bottle)—"That's so, but you see it's only one in 12,000."

Patient (turning white and gulping)—"But, good Lord, doc, I might be that one."

Health—Even Life!

Just how much is it worth to you?

Is it worth your sitting down right now for two minutes and writing this message to the Paradise Spring Co., Brunswick, Maine: "Send me, free of all charge, the vital facts that show just what Paradise Water is and what it will do for me"?

To make it still easier for you to do this, we have placed a handy coupon in the lower right-hand corner of this announcement. Do this simple act—now, and pave the way to *improved* health. Or the *maintenance* of good health. For that's equally as important.

We can't begin to tell you the whole, interesting story of Paradise Water in this one message. That's why we urge you to send for the full details: its deliciousness and use for a hundred years—its freedom from mineral content and how this encourages elimination of waste products and poisons—how Paradise therefore reduces blood pressure, wards off hardening of the arteries and encourages all organs to function normally—why medical authorities endorse it for relieving cases of Articular Rheumatism and Kidney Disorders.

Many people who read this message will want Paradise Water at once. They can get it direct from the Spring, without sending a penny in advance. You remit to us after the shipment has been received by you. We are willing to do this because we *know* how pleased you will be with Paradise Water—how you

will enjoy its delightful taste as well as benefit by its health-building qualities.

The prices of Paradise Water are: Case of 1 doz. Quarts, Natural, \$2.50, Carbonated, \$3.00; Case of 2 doz. Pints, Natural, \$3.00, Carbonated, \$3.50; Case of 3 doz. Half-Pints, Carbonated (only), \$4.00. Carrying charges paid to any point East of the Mississippi and North of the Ohio, and elsewhere not carrying excessive rates. Order on the coupon below. Send no money with your order. If you want information first before ordering, use the coupon for that purpose also.

Remember, if you are ailing from any form of Articular Rheumatism or Kidney Disorder, you need Paradise Water to help you get well. If you are healthy *now*, you can drink Paradise to *preserve* that health and increase your years of usefulness and well-being.

BUSINESS STABILITY

IN a town of the writer's acquaintance there has been a great shortage of houses, principally dwelling-houses. Rents consequently have been high, for rentals, like other things, are subject to the law of supply and demand and are fixed by the demand for houses and the adequacy of the supply. The situation has for several years been serious. Business has suffered as a result of the shortage of dwellings, the normal activities of the town have been hampered, many of the citizens have been hard put to it to find a place to live, and when a house has

been available the rent oftentimes has been more than they could well afford to pay.

More houses of course is the solution of such a problem, but building costs have also been high, and, though many people have wanted to build, there has been little inducement to do so, either for investment or for the purpose of providing homes for themselves. In order to correct this state of affairs the local contractors' association, in the autumn of 1921, called a meeting of the heads of the various local unions and asked them to

reduce wage scales, so as to bring building costs within the reach of those who wished to build. The unions considered the matter, and decided that it was better for their men to work at lower wages than to hold out for the same high wages which had been in effect previously and remain idle. Which was good common sense.

An agreement was therefore signed, to remain in effect until the early summer of 1923, and the unions bound themselves not to demand any increase before that time. Labor costs constitute the largest percentage of the expense of any building operation, and with the reductions agreed upon the contractors were enabled to quote prices which were attractive to prospective builders. A large number of contracts were signed almost immediately and the town entered upon unprecedented building activity. Every contractor was busy, every mason and carpenter and painter was employed, and houses were started in all sections of the town. The end of the difficulty seemed to be in sight.

About a fortnight ago, however, the masons', plasterers', and bricklayers' unions decided that with so many houses partially completed the time was favorable to demand an increase in wages. They therefore notified the contractors that unless the desired increase was forthcoming they would call a strike. The contractors naturally were thunderstruck. They had contracted to build houses at prices fixed by the agreement which the unions had signed. They themselves had signed in good faith, and had considered that the unions had done likewise. To add to their confusion they learned that the other unions—the carpenters', steam-fitters', etc.,—were only awaiting an answer to the plasterers', bricklayers', and masons' demands before making similar demands themselves.

Under the circumstances there was but one thing to do, and the contractors did it. They shut down on all work. Building operations in the town are at an absolute standstill. Unfinished houses are to be encountered in all sections of the borough, and no one can guess when they will be completed.

Of course there is no excuse for the action of the unions. They were guilty of a flagrant breach of good faith. The citizens to a man are backing the contractors and the unions will undoubtedly be the sufferers in the long run.

The real point of this little story is, however, that business is good when people doing business know what they can count upon. In the town we mention building was slack because no one knew what costs were going to be from month to month. Contractors could not give definite estimates, and naturally no one is going to build a house without a pretty definite idea of what the final cost is to be. The minute the unions agreed to a settled and reasonable wage scale the building business boomed. Now things are all upset again and building has stopped.

What the building trades unions did

FINANCIAL DEPARTMENT

(Continued)

in this small town many other unions have done in other places. And strikes cause uncertainty, and uncertainty makes for instability, which is the greatest depressor of business known. Our whole social system is a vast interdependent organization; it is dependent upon good faith, fair dealing, and an unprejudiced view of mutual interests.

The post-war depression period unsettled prices, and the task of the business world has been to bring them back to a more or less permanent and fixed basis. It does not matter so much what prices are so long as they are reasonably stable and not in a constant state of flux. An illustration of this is furnished by the international exchanges. In itself the fact that a German mark is quoted at thirty-five-hundredths of a dollar is not so important. The important question is, What is a German mark going to be worth six months from now, or a year, or two years? If that point can be settled with a fair degree of accuracy, business in marks can be done. But no sane man is going to sell goods when he has no idea whether the money he agrees to accept for them is going to be worth anything or not. Nor will he buy unless he knows what he will have to pay.

It is the same in all business. Orders must be received before the factories can operate, and business men will not order far in advance unless they know what they are going to have to pay, and whether that will be the price then obtaining for the particular kind of goods they want. Many of our industries have been so demoralized during the past year that sometimes a half-dozen salesmen would offer the same goods on the same day at six different prices. Industry and business must be balanced and orderly if prosperity is to result. Business men want to know where they stand on prices, and the public is entitled to know where it stands on unwarranted strikes. Most people recognize the duty of others, but are slow to acknowledge their own. The masons' union will fight to the last ditch for an increase in the wages of its own members, and those same men will complain bitterly about the prices they have to pay members of the plumbers' union for repairing a pipe in their kitchen.

Generally, however, business is ironing out the wrinkles in its working clothes. Prices are readjusting themselves, money is easier, with falling interest rates, so that business can afford to borrow the capital it needs to supply its wants. Stocks of goods on hand have been pretty well used up, but human wants are endless and must be satisfied, and this creates demand, and demand makes for business activity. Present stocks of foodstuffs and raw materials used in industry are not large; the same is true of clothing materials, of metals of many kinds, of farm products. This means that business activity will be needed to replenish the depleted stocks, and these orders will carry us

FINANCIAL DEPARTMENT

(Continued)

farther along the readjustment highway. Foreign trade is improving, and it will mean prosperity to business if we can carry on business dealings with other countries than our own. And as the foreign exchanges grow stronger foreign buyers are enabled to buy more and more in our markets.

In other words, what business needs above everything else is stability. People want to know where they stand. What man will order his next winter's supply of coal delivered to him on October 1 and agree to pay the price obtaining on that date unless he knows fairly accurately what that price is going to be? But confidence in the future of prices is growing; in spite of temporary setbacks, the business situation is, on the whole, becoming more favorable from month to month; and most people feel themselves warranted in believing that things will soon be pretty well settled and that they can count on what there is ahead. That means confidence, and widespread confidence in the future of business means prosperity.

The Outlook

JULY 5, 1922

(C) Keystone
WALTER RATHENAU

THE ASSASSIN OF RATHENAU STRIKES GERMANY

DR. WALTER RATHENAU suffered death by assassination because of his virtues. He fell because he was serving, better than any one else in his position had served, both Germany and the cause of justice and peace in Europe. His name will long be remembered as that of a German statesman who not only acknowledged Germany's defeat, but also actually made an effort to enable Germany to repair some of the damage she had done. He was killed because there are still powerful and uncontrolled interests in Germany which are intent on punishing any effort to transform Germany from the aggressive and dominating power she aimed to be under Prussia to a decent and neighborly and morally responsible member of the family of nations.

During the war Walter Rathenau had great power in organizing the whole industrial system of Germany for the purpose of prosecuting the war effectively. He had had great experience in organizing business as a banker as well as an industrial expert, and had been president of the great electrical concern known as the Allgemeine Elektrizitäts Gesellschaft. When the armistice came, he saw the need of systematic reconstruction, and it was as Minister of Reconstruction in the Wirth Cabinet that he negotiated with Louis Loucheur, the French Minister of the Liberated Regions, the arrangement known as the

Wiesbaden agreement, which was the first really practical arrangement for enabling Germany to build up as much as possible of what she had wantonly destroyed, and thus, instead of hostility on the part of Germany and the consequent distrust on the part of France, to substitute a measure of mutual confidence.

Though this arrangement opened the only possible way to the welfare of Germany as well as Europe in general, it was denounced by the militarists of Germany, and Rathenau was made the target of their threats. Later he became Foreign Minister, and he served at Genoa. The people in Germany who made Germany's aggressive war possible, who really made modern Germany feared and hated and despised, were the fiercest opponents of Rathenau. On June 23 Karl Helfferich in the Reichstag assailed Rathenau for his reparations policy, and the next day an assassin (some say, two assassins) in an automobile drove up beside the car in which Rathenau was riding and with firearms and hand grenades killed him.

If this act of assassination arouses the people of Germany to an understanding of the Prussianism that has brought them to the state in which they find themselves, it may in the end serve some good purpose; but the history of Germany in these last years does not provide much hope for any such effect upon the German popular mind. It will at least arouse those who are already aware of Germany's plight, and it may in the end strengthen the determination of the Wirth Government to pursue a policy of comparatively honest recognition of the facts as they are. It will be hard, however, to find in any consequence of this murder any compensation for the loss to Germany of a man who was serving her well.

FIELD MARSHAL WILSON ASSASSINATED

IRREGULAR guerrilla warfare has in Ireland long been followed by sheer assassination of individuals. Such killings are never or rarely acknowledged by any factional leaders even among those who are self-constituted officers in nebulous armies. Many such murders are doubtless the work of fanatics or anarchists. Yet they are a symptom and a sign of bitter political hatred and a political condition that needs wise and firm conduct.

There is no evidence that the two

FIELD MARSHAL WILSON

men, Connolly and O'Brien, who deliberately shot down Field Marshal Henry Hughes Wilson in London on June 22 were the appointed agents of any faction or society. Neither is there evidence that they were actuated by personal enmity. All leaders of the Sinn Fein extremists not only disown but denounce the crime. Yet it was almost certainly the outcome of the quarrels and murders that have been so common in Ireland for years. Both sides have a long list of such crimes against them. The murder of General Wilson by men who hated him because he stood for enforcement of law in Ulster is no worse in itself than the massacre of the McMahon family not long ago by enraged anti-Sinn Feiners. But the results in arousing the public to demand an effective course of dealing with the Irish people will be enormously more important.

One immediate result was the statement in Parliament by Winston Churchill for the British Ministry that they would expect the Provisional Government, now that it had secured the people's mandate, to take the necessary steps to assert its complete authority, and that the British Government would not allow the coercion of Ulster by the South—in fact, that failure to observe the treaty would mean that the British Government would resume complete freedom of action.

This reasonable declaration followed what was practically a vote of confidence on Lloyd George's Irish policy, with the majority of 342 to 75. The

London "Spectator," which has been vigorously opposed to Lloyd George, says: "The murder ought not to deflect our policy. If that policy is wise in itself—which we, of course, don't admit—it should not be altered because murderers have succeeded in their plans."

Field Marshal Wilson was one of the most distinguished officers in the British army. His services during the last war were of the highest order. He became a soldier when only twenty, served in the South African War, entered the World War as Lieutenant-General and aided Marshal Foch as a general liaison officer. He was an Irishman, an Ulsterite by conviction, and had acted as Chief of Staff under the Ulster Premier, Sir James Craig. Probably this last fact was what marked him out for anti-Ulsterite hatred and made him the victim of assassination.

DR. WU AND DR. SUN

ALMOST simultaneously despatches from China report the loss of two leaders of the Canton Government. The loss of one is by death; of the other, by capture. At any time before now this twofold loss would have been greatly deplored by those who have hoped for the development of free institutions in China; but, coming at this time, this great blow to the Canton Government may be a gain to the cause of Chinese unity and not impossibly a gain to the cause of real liberty and progress.

Wu Ting-fang, whose death on June 23 at eighty-one years of age has been reported, was better known in America than most other eminent Chinese—perhaps than any other. His reputation in America was won by his ability, wit, friendliness, and honesty as Chinese Minister to the United States. He was sent to Washington in 1897, and retired in 1902. While here he was accredited also to Spain and Peru. He went to Spain once, but did not go to Peru until after he had left Washington. He became well known through the amusing interviews which he had with newspaper representatives; for he managed matters so that the interviewers became the interviewed and were left to report his questions and as much of their answers as they cared to reveal. His frank inquiries into what we commonly consider private affairs gave the impression that he was incorrigibly bland and ingenuous; but a great many of his questions were, in fact, caustic but skillfully concealed comments on life as he saw it in the Occident. During his services here he was often called upon to make public speeches. Even at the time when it was believed that Americans in the Legation at Peking had been massacred Dr. Wu suffered no molestation,

WU TING-FANG

but had every opportunity to interpret the situation to Americans. The fact that his reports of events were accepted as authentic by the American Government proved his trustworthiness; but, occurring at a time when the rest of the world refused to believe that Dr. Wu's reports were true, it also proved the fair and just treatment he had received from America. As *The Outlook* said at the time, Dr. Wu "bore himself during that crisis with consummate tact and courage," and he proved "of great service to his country in assisting Mr. Hay in carrying out the policy which has preserved China from the most disastrous consequences of the attempt to destroy foreign influence." Before his mission to Washington he had studied at Lincoln's Inn in London, had been the adviser of Li Hung-chang, had helped to build the first Chinese railway, had been president of the university at Tsinsing, and had been secretary and finally a member of the Peace Mission at the end of the war between China and Japan. Even in his old age he continued in public service. In 1911 he became managing director of the China Merchants Steamship Company, in order to reorganize the company's business at a time when the official directors nominated by the Chinese Government had not produced satisfactory results. When the Chinese of the South set up a Government at Canton as the real representative body of the Republic under the leadership of Sun Yat-sen, Dr. Wu became Minister of Foreign Affairs; and such he was when he died.

Though there have been conflicting reports concerning Dr. Sun, it is evident that he has disappeared from his former place of power in the South, at least for the time being. Since the defeat of the Manchurian military chieftain Chang, who had the support of the Canton faction through the anomalous but not un-

precedented partnership between doctrinaire idealism and military dictatorship, the Canton Government, such as it was, has seemed to be dissolving. China's development toward unity seems now to be dependent upon another Wu—the victor over Chang, General Wu Pei-fu.

THE FEDERATION OF LABOR AND THE CONSTITUTION

IN the resolutions adopted by the Federation of Labor at its meeting just held at Cincinnati, the radical and untenable attack by Senator La Follette on the United States Constitution was indorsed, with additional suggestions for amending the Constitution.

The Federation proposed that voters be called upon to join organized labor in a National campaign to secure four Amendments to the Constitution and also to demand the repeal of the Sherman Anti-Trust Law. The first of the Amendments proposed would restrict child labor; this is the method lately urged by Mr. Owen R. Lovejoy, General Secretary of the National Child Labor Committee, in a public address, as the one practical way of protecting American children of tender years. Few, we think, will agree with the Federation's programme for Amendments which would give Congress power to veto Supreme Court decisions by repassing with two-thirds majority any law declared unconstitutional; nor would the proposal to prohibit by an Amendment the enactment of any law dealing with the rights of workers in industrial matters generally be regarded as desirable or definite; while the fourth proposal, namely, to make the amendment of the Constitution much easier, is also contrary to the best present opinion.

The Federation again put itself on record as drastically opposed to the methods and principles of Soviet Russia, and defeated almost unanimously a resolution recommending the immediate recognition of the Soviets by this country.

For the forty-first time Samuel Gompers was elected to the office of President of the Federation, and the choice of other officers indicated that the Gompers régime and influence are still predominating.

THE MINE MASSACRE

TO parallel the brutish murders of the Herrin coal-mine massacre one has to turn back to the Colorado labor war of 1914. Even at that time there was no such cold-blooded slaughter as that at Herrin, where at least a score of non-union employees of the Southern Illinois Coal Company were slain after surrender to the mob of strikers. There was

THE MILITARY BOARD VISITS THE SCENE OF THE ILLINOIS MINE MASSACRE

General Milton E. Foreman, Colonel Samuel Hunter, and their aides are here seen interrogating striking miners. General Foreman is speaking to a miner, both standing in the railway track

not the slightest attempt on the part of the sheriff or other local authorities to stop the strikers from their march on the mine, nor did the State authorities do anything to preserve order. The wholesale murder is a blot on the community and on the State, whose officials should have informed themselves of the impending attack and should have known that the tense state of hostility existing might lead to bloodshed any hour.

Illinois cannot afford to stand idly by while a crime like this is committed. Yet Colonel Hunter, of the Adjutant General's staff, declares that he repeatedly asked the State authorities to send troops before the attack, as he did not believe that the local authorities were either able or inclined to handle the situation. A feeble attempt was made before the coroner's jury to show that the strike-breakers or mine operators were the aggressors in that, as one uncorroborated witness claimed, the superintendent, Mr. C. K. McDowell, a one-legged man, who was heartlessly butchered in the massacre, had previously shot a striker who was prowling at night around the mine. It was on this allegation that one of the several coroner's verdicts declared that the death of the strike-breakers resulted from the activities of the mine officials. The systematic, warlike march and attack of the striking miners in fact shows that the slaughter was deliberately planned, and not an act of heated retaliation.

All reports from Herrin show that the striking miners regard their murderous onslaught as a just war against the pres-

ence of strike-breakers and hired guards in and about a mine where a strike existed.

The country at large is horrified at the atrocity of this labor battle. It should now insist that, so long as some workers have the right to strike and others have the equal right to work when and where they wish, the authorities—local, State, and National—have a duty to keep order and put down lawlessness. Protection must not come from armed private guards, but from sheriff, police, and troops. This is axiomatic, but almost every violent clash in labor wars has come because the authorities waited to offer protection and guard life and property until the battle was over. This kind of trouble is easily foreseen and should be stringently forestalled.

In deploring the massacre in the Illinois coal fields, Secretary Davis, of the Labor Department, declares: "Surely no better argument can be advanced for the settlement of these disputes around the conference table than the dead bodies of American workmen who met a futile death in this outbreak. Surely in this civilized age questions of dispute between men and industries can be adjusted without resort to bloodshed."

Yes; but it is for the Government to lead the way. So far it has made little progress in bringing coal labor and coal capital together. Mr. W. P. Helm declared in an article in *The Outlook* last week, well entitled "A Private Dispute and a Public Calamity," that as to anathracite the people are "facing a certain shortage of coal next winter," and "the

bituminous-coal situation hasn't gone quite so far to the bad, but is on its way there with a whoop." If this is so, the early fall will see a public outburst of indignation that will result in some such supervision of the coal industry by the Government as it now exercises over the railway industry through the Railway Labor Board.

GOVERNOR SMALL ACQUITTED

Nearly a year ago *The Outlook* recorded the indictment of Governor Len Small, of Illinois. The charge was at first the embezzlement of State funds, and the Governor was charged with having misappropriated \$500,000 while he was State Treasurer; but the indictments were amended into an accusation of conspiracy by which, as the prosecuting attorney asserted, Governor Small when he was State Treasurer, Lieutenant-Governor Sterling, the late Mr. E. C. Curtis (who was a State Senator), and Mr. Vernon Curtis (a Chicago banker) defrauded the State of interest on public funds. It was alleged that those accused revived a practically defunct bank through which State funds were loaned to Chicago packers at 8½ per cent interest, of which the State got only 2 per cent.

The trial of Governor Small resulted on June 24 in his acquittal. The jury evidently agreed with the contention of the defense, that there was no evidence that use by the defendant, when he was the State Treasurer, of the State's funds had been obtained under false pretenses, or that he had exceeded his rights and powers in depositing State funds in the banks or had been in-

fluenced by other reasons than to obtain sound collateral security for the deposits.

From the beginning Governor Small has declared that the prosecution was inspired by political enmity. Whether this is so or not, his acquittal will tend to increase his usefulness as a public officer, and it has been warmly welcomed by his political supporters.

We congratulate Governor Small on his acquittal, and particularly congratulate him on the good sense that led him to abandon his first contention that a Governor had an official right to resist arrest and trial. The result has been that the law's authority over individuals has been upheld and at the same time an accused official has been vindicated through the courts.

THE DEFEAT OF THE FUNDAMENTALISTS

ULTRA-CONSERVATISTS, who call themselves Fundamentalists, were defeated by a decisive vote at the Northern Baptist Convention, which was held at Indianapolis, June 14-20.

From the time of its origin the Baptist denomination has held it contrary to the spirit of Christianity for ecclesiastics to impose on the churches a creed as a test of faith. Fundamentalists, however, have come to believe that there has been such a "drift toward modernism" that it was desirable for the Baptist churches to adopt a creed. It was their attempt to secure the adoption of a Baptist creed or confession of faith as a standard of doctrine that the Convention defeated.

Holding the view that the Bible is inerrant and infallible and the theological positions associated with that view, and maintaining that Baptist colleges were unchristian and the seminaries heretical, the Fundamentalists have refused to support the Baptist New World Movement, which has as a goal the raising of one hundred million dollars for missionary and educational purposes by 1924. Shortly before the meeting in Indianapolis the Chairman of the Fundamentalist Executive Committee, Dr. J. C. Massee, of Boston, issued a call, addressed to all pastors in the denomination, for the attendance of a sufficient number of "independent Baptists" at the Convention to accomplish the purposes of the Fundamentalists to put out and keep out of Convention offices and missionary boards all men of tendencies opposed to their views. The independent Baptists who responded proved to be too independent to follow the Fundamentalist leadership.

Hitherto the moderate and non-partisan conservatives as well as the liberals in the denomination have pursued a

policy of conciliation toward the reactionary faction; but, aroused by this declaration of the Fundamentalists, they at last joined to oppose the effort to control the personnel of the Convention and missionary boards. Before the Convention the Fundamentalists held a pre-Convention conference, at which William Jennings Bryan was the principal speaker and delivered his now familiar attack upon evolution. At that conference the Fundamentalists voted to urge upon the Convention a formal confession of faith, or to bring about the appointment of a commissioner to prepare a statement of faith and report in two years' time. Finding the opposition stronger than they expected, the Fundamentalists resorted to the strategy of recommending to the Baptist churches the New Hampshire Confession of Faith as a "clear and competent confession." Originally prepared some fifty years ago as a protest against the position of the Free Baptists, this Confession has been largely used by individual churches, and it was thought that its prestige would be sufficient to procure its adoption; but it was not sufficient to overcome Baptist repugnance to an authoritative creed.

After the proposal of the Fundamentalists was defeated by a vote of 1,264 to 637, a substitute resolution by Dr. Cornelius Woelfkin, of New York, was adopted, which read:

The Northern Baptist Convention affirms that the New Testament is the all-sufficient ground of our faith and practice and we need no other statement.

The action of the Baptist Convention is welcome to progressive minds in other denominations.

ANOTHER ROUND TABLE SESSION

THE first sessions of the Round Tables of the Institute of Politics planned by President Garfield, of Williams College, took place at Williamstown last year. They were of distinct and material service in the study and discussion of international subjects by men of international importance. The list of speakers was notable. It included Viscount Bryce, of England; Senator Tittoni, of Italy; Professor Viallate, of France; Baron Korff, of Russia; Stephen Panaretoff, Bulgarian Minister to Washington; Count Teleky, ex-Premier of Hungary; and others of almost equal importance.

A second session of this Institute will be held at Williamstown this summer, and it is hoped that the conferences will be continued for other years. We are informed that Mr. Bernard M. Baruch, of New York City, is again providing funds to meet the expense of the Insti-

tute; that all persons qualified to participate in the discussion by reason of special knowledge or experience in the field of international relations are eligible for membership; that the admittances this year will include a considerable group, not only of authors and editors, but also of lecturers on current events; and that present enrollments indicate that the membership of the Institute will be double that of a year ago.

A well-thought-out list of topics for discussion at the fourteen separate Round Tables takes up such vitally important topics as the rehabilitation of Europe, interallied debts, problems of eastern and southeastern Europe, Soviet Russia, China, Japan, and Siberia, and the problems of the Pacific.

The list of speakers for this year includes many American publicists and leaders in education. The foreign list, if not so extraordinary in its personnel as that of last year, is still highly gratifying and promising. It is led by Lionel Curtis, who was secretary of the First Peace Conference, and has had remarkable experience in planning self-government for the South African Republic. His book "The Commonwealth of Nations" is a standard work. The French representative is Raymond Recouly, editor of "Le Temps" of Paris, who will speak on the influence of the press on international relations. Dr. Rikitaro Fujisawa, of the Imperial University, Tokyo, will represent Japan at the Institute; he is indorsed by Ambassador Shidehara as one of Japan's foremost authorities on international politics. Dr. Josef Redlich, of Vienna, eminent jurist and former Austrian Minister of Finance, will discuss Central European affairs. The Hon. Manoel de Oliveira Lima, former Brazilian Minister to Belgium, Japan, and Great Britain, will deal with Latin-American questions. Each of these speakers is to deliver a series of six addresses.

ACADEMIC HONORS

JUNE, 1922, will be remembered by thousands of college and university men and women for its abundant rainfall. Academic celebrations in the eastern part of the United States were accompanied with almost incessant showers and with occasional lightning, thunder, and hail. Much of the picturesqueness with which the conferring of degrees and the assembling of alumni for their reunions, to say nothing of the festivities of the seniors as they finished their course, are customarily surrounded was obliterated. Even dignity suffered when the spectator kept one eye on the hooded speaker and the other on the threatening sky. Solemnity seems to

disappear when an academic procession breaks ranks and the participants scurry to shelter.

Apart from the weather, however, the events of Commencement in the colleges and universities of Eastern States were as impressive as usual. Since they are among the older of our great universities, Harvard, Yale, and Princeton—all three, though Eastern in their location, being National in their constituency and influence—are especially rich in their academic traditions. At Harvard, for example, the hymn which the assembled graduates sing together on the afternoon of Commencement Day to the old tune of "St. Martin's" has been sung there for over two hundred years. To-day, as for generations, the Commencement exercises at Cambridge are opened by the sheriff of the county in uniform, who strikes the floor three times with his sword and calls the assemblage to order. There is special distinction in the honorary degrees granted in such institutions as these, because they admit the recipients to a fellowship that is not only honorable but, as measured in American terms, ancient.

One of the distinctive features of this year's Commencement exercises was the fact that Eastern colleges selected an exceptional number of representatives of journalism for academic honors. At Princeton a doctorate was bestowed upon W. J. Henderson, the musical critic of the New York "Herald." At the University of Maine, Mr. Lincoln F. Colcord was honored for his contributions to periodical publications. At the University of Vermont and at Bowdoin College the doctorate of letters was bestowed on Lawrence F. Abbott, President of The Outlook Company. At Dartmouth the same degree was bestowed upon a Boston journalist, formerly of the Boston "Transcript" and now of the Boston "Herald," Mr. Robert Lincoln O'Brien. At the same college the master's degree in arts was given to Harry Chandler, of the Los Angeles "Times." Bowdoin honored L. A. Coolidge, who has not only been a business man and a fine public servant but a journalist as well. Yale made a Master in Arts of Adolph S. Ochs, the man who has made the New York "Times" the great newspaper it is to-day.

Colleges, not necessarily themselves co-educational, granted honorary degrees to women. Vermont and Dartmouth honored Dorothy Canfield Fisher; Tufts honored Mme. Louise Homer; and Columbia earlier in the month had honored Mary Mills Patrick, of the Woman's College at Constantinople.

Music received recognition by the bestowal of degrees by Tufts on L. R. Lewis; by Princeton on W. J. Henderson,

not only journalist but also musician; by Columbia on Paderewski, first as the artist in music and secondly as citizen; and by Harvard on John Alden Carpenter, the business man of Chicago who is eminent as a composer of songs and orchestral works.

The Armament Conference was the chief cause of such degrees as that bestowed by the University of Michigan upon Secretary Hughes, those bestowed by Columbia on the Chinese delegate Alfred Sze and the Portuguese delegate Count d'Alte, and, most significant of all, though not occasioning any surprise, the doctorate of law bestowed by Harvard on Senator Oscar Wilder Underwood, of Alabama.

Literature of course received its recognition in such degrees as that given by Yale to Edwin Arlington Robinson and by Harvard to Judge Robert Grant, who is a writer as well as a jurist, and to Frederic Jesup Stimson.

HARVARD HONORS A FIGHTER FOR RIGHTEOUSNESS

IN all these degrees there is of course the recognition in one form or another of distinguished public service. Public office is not the only place in which public service is rendered; but it is not without special significance that the youngest man whom Harvard chose for an honorary doctorate, one of the youngest men upon whom any great university has ever bestowed that degree, was a man whose service was rendered against great odds, in the face of prejudice, calumny, and threats, in the public office of the Commonwealth's Attorney.

John Weston Allen, a graduate of Yale College, is the Attorney-General of Massachusetts. The story of his fight against the evils practiced by the district attorneys of the two counties comprising virtually the metropolitan district of Boston cannot be told here in full. It is sufficient to say that these two district attorneys were ultimately disbarred and removed from office because of their abuse of power and authority. First proceedings were brought against District Attorney Tufts, and then against District Attorney Pelletier. The attempt on the part of Pelletier to escape by complaining that he was the victim of religious persecution failed because, while he is a Roman Catholic, the other culprit is a Protestant, and both suffered the same fate. The Judge of the Supreme Court in his memorandum in the Pelletier case found the accused guilty of getting money by making threats of prosecution. What Attorney-General Allen did was to save the Commonwealth from the disgrace of the further use of its machinery of gov-

ernment for extortion. Though he did not work alone, but had the co-operation of citizens of Massachusetts, he deserves the honor that comes to the leader of the fighting forces. President Lowell, of Harvard, in bestowing the degree characterized him as "our Hercules, who from its dark cavern dragged a hydra of iniquity and slew it."

WALTER HAGEN: GOLFER DOCTOR, SUMMA CUM LAUDE

AMERICA may not have won the Presidency of the League of Nations, but it is some compensation to know that it has won the blue ribbon, the first honor, the supreme distinction, in one of the most important of modern international activities. We refer of course to the success of Walter Hagen, the first home-bred golf professional to win the open championship of Great Britain in the Royal and Ancient game.

The origin of golf is hidden in the dim haze of history. There are students and philosophers who maintain the theory that it was a Dutch invention, but, to all intents and purposes and as far as the records of man run back, it was of British origin. By that we mean that it was Scotch in its first stage. Then the English took it up, so that now it is really a British institution, although the Mecca of all golfers is still St. Andrew's, where the University, founded in 1410, plays second fiddle to the golf course. The greatest golf professional the history of that ancient game has ever known, or perhaps ever will know, was old Tom Morris, who is a more famous celebrity of St. Andrew's than any principal or professor or philosopher of its ancient University. There is certainly not a college or university town in the United States which does not now possess its golf course, although not much more than twenty-five years ago the Americans who knew the meaning of the word golf, or the names of its implements, or the rules of its procedure, could be counted on the fingers of two hands. Some years ago an American, Walter Travis by name, went to England and won at Sandwich the amateur championship. But no American-born professional has succeeded in capturing the open championship, in which amateurs and professionals from Scotland, England, France, Australasia, and the United States have competed, until Walter Hagen, less than two weeks ago, won the coveted honor. Last year an American citizen, although Scotch born and Scotch taught, won this honor. We refer to Jock Hutchison. This could not quite satisfy even those who tried to look upon it as an American victory. But Walter Hagen was born in Rochester, New York; learned his game there

as a caddy; and his golf, therefore, is completely and purely an American product. And that is why we confer upon him the well-deserved title of *Golf's Doctor*, *Summa Cum Laude*.

There is more than one reason why he deserves this academic title. We shall, however, content ourselves with stating only one. Golf is pre-eminently a literary and academic game. No other contest in the English-speaking world, not even cricket, has gathered about itself such a body of literature as golf. Long after this printed page is returned to the wood pulp from which it sprung some essayist or poet will write an account, as well worth reading as George Borrow's apostrophe to the Bruisers of England, of Walter Hagen's great feat on the historic turf and among the historic dunes of Sandwich.

BLUE WATER AND BLUE LAURELS

THE winning of the British open golf championship by a native-born American was easily the most important event in the world of recent sports. But it certainly did not diminish public interest in the domestic contests which lend color to the close of each college year.

Of the Eastern events, the race at Poughkeepsie easily ranked first in National appeal. In this regatta many Western crews have participated—this year the Pacific coast was represented by the University of Washington. The first honors went to the remarkable crew of the Naval Academy at Annapolis. Washington, Syracuse, Cornell, Columbia, and Pennsylvania crossed the finishing line in the order named.

As a National event the Poughkeepsie race has come to outrank the dual contest between Harvard and Yale on the Thames, but the race at New London has lost nothing of its old-time color and enthusiasm thereby. This year both Harvard and Yale had suffered defeats over the two-mile distance prior to the final race between these ancient rivals, a fact which detracted little or nothing from the joy of the adherents of Yale when their crew crossed the finish line some three lengths and a half in the van. Harvard and Yale still adhere to the old four-mile distance; the Poughkeepsie race is three miles long. The present victory over Harvard gives Yale the lead of one in the long series of races between the two universities.

Yale also is rejoicing in the winning of the baseball series with Harvard. Both Yale and Harvard defeated Princeton, and therefore the crown in this triangular contest may be said to perch jauntily on the topmost tower of the new Harkness Quadrangle at New Haven.

AMERICAN OPINION DISTURBED OVER THE TARIFF BILL

FOR a long time after the Civil War the American people took their tariff bills with little seriousness. The schedules were practically written by interested private groups who furnished inconclusive data and alleged evidence to Congressional committees. The whole process was highly conventionalized in the public mind; and the convention about how high a tariff rate should be and why was supported by a vast amount of propagandism on the part of the interested private groups. It was all for the sake of the full dinner-pail and the protection of American wage-earners from the so-called pauper labor of Europe! The politics of the generation following the Civil War was thus distorted by a crass and deceptive materialism. Partly for this reason, American politics remained a rather stale and unprofitable thing until the wind of idealism began to blow through it again in the last decade of the nineteenth century and the opening years of the present century.

The two elections of President Cleveland in 1884 and 1892, and the closer scrutiny of the McKinley rates in 1890 and the Dingley rates in 1897, marked the approach of a changing attitude about the tariff on the part of the American people. They were beginning to wake up to the hypocrisies and the abuses of the system of fixing the schedules and to the injustice of the tribute which was thus levied upon them in the name of patriotic humanitarianism. Under the leadership of Senator Dolliver, of Iowa, in the middle of the Taft Administration the rising revolt reached a crisis, and a too generous support of the Payne-Aldrich Tariff Bill by President Taft contributed largely to the bringing down of his Administration like a house of cards about his head.

Ever since the American people have been sensitive on tariff bills. They have been working in opinion towards some sort of a genuine, permanent, non-partisan commission which should take the tariff out of politics entirely, fix the rates in accordance with some reasonable principle, and alter them as fast as they need to be altered. The country has not given up the American doctrine of protection to home industry. It seems to us that it is as thoroughly committed to this doctrine as ever. But it is now too wide awake to be fooled longer by any selfish method of applying the principle of protection. It is no longer so stupid that it does not realize that Congress has never known enough about

the subject to write schedules on their merits, and has called in private-group experts to do the business. And the country is through with such a system.

Everybody seems to understand this except the politicians at Washington, who are now busy with another new tariff bill. The House has produced a measure containing rates with which the Senate is now tinkering. Tinkering is a word which has naturally grown up to describe Congressional activity on the tariff, because tinkering is the only word which applies. You tinker with a thing about which you know little. Intelligent persons who have examined the bill critically in its present stage are not enamored of it. The debate in the Senate indicates that there is something fundamentally wrong. Senator Frelinghuysen, of New Jersey, who is for the bill, and who declares that it is as good as can be prepared under the circumstances and should be passed quickly to relieve business uncertainty, stops long enough to denounce roundly the method of producing the bill. He describes the product as "a complication of statements of manufacturers, importers, merchants, and farmers, and of inconclusive data collected by Governmental agencies inadequately equipped." He points out that the Finance Committee of the Senate took three thousand pages of testimony, and that no one could "wade through this gigantic mass of information without confusion or be sure of its conclusions because of the technical nature of the subjects." He is reported to have gone on to say that opponents of the bill had obtained parallel information from other sources considered equally as reliable as those from which the Committee had obtained its information, and that alleged facts relied upon by both sides were so different that doubt was thrown on the accuracy of all of them.

This is certainly a description of a mess rather than of a measure. And it reinforces from a high Congressional authority the view of unprejudiced experts who have examined the schedules of the bill. Congress has as yet evidently had neither the information nor the intelligence to master and subdue the rates which were handed to its committee by interested parties. It seems to be the old, old story again retold.

Senator Frelinghuysen also said in his speech that the public mind was thoroughly awake to "the abuses of this system and to the necessity for reform. And this awakening should be a warning to all of us to take the tariff out of politics." We think he is right. As we understand the American people, they are favorable to an ample and reasonable protection for American industry. They

do not wish America to be the dumping-ground of commodities from abroad which have been produced under low and inhuman living standards. They do not think this is necessary in order that imports may pay what is owed to us abroad. In time, services furnished by other peoples to us will help out imports in slowly paying as much of this indebtedness as we may wish finally to exact from other peoples.

Neither does the country wish the schedules of a tariff bill to be practically written by selfish private interests at home. The quicker the system is radically changed and removed from politics altogether, the safer it will be for the Administration in power and the better it will be for the country.

FILE THEM OFF

THE illustration of the feathered instrument which accompanies this editorial is something of a veteran. It first appeared on the cover of *The Outlook* in 1920. We wish that we could persuade some of our outdoor contemporaries to borrow this cut and run it regularly at the masthead of their angling columns.

This picture was first published as part of the record of the beginning of a movement for the elimination of the barbed hook from those trout-fishing waters of the United States which still rejoice in the residence therein of *Salvelinus fontinalis*. We are glad to say that the movement has not died by any means. In fact, it appears to be growing. Evidence of this fact may be found in a letter which came to the Outlook office not long ago from the manager of one of the best-known fish and game preserves in the State of Maine. He wrote us to the effect that he believed that the adoption of the barbless hook by many members of his club had done more to improve the fishing than anything else which had been tried.

It has been our happy-go-lucky American fashion to forget that the supply of fish in a lake or stream is not inexhaustible. We do not indiscriminately slaughter the chickens in a flock, because it is quite obvious to the eye that every chicken that is wasted makes one less chicken to eat. When it comes to our fishing resources, however, we throw the simple mathematics of subtraction to the winds and resolutely refuse to take into account the equally definite reduction which is invisible to the eye.

All those who know trout are agreed that to break the protective covering of slime upon their bodies is to invite a fatal fungous disease. They are equally agreed that any damage to the gills

results in most cases in death. This is the reason why the barbless hook is a fish preservative of the first order.

In the hands of even a moderately skillful fly-fisher the barbless hook is almost as efficient an instrument as its barbed rival. If the line is kept properly taut, the number of fish lost (particularly in lake fishing) which would not have been lost from a barbed fly is negligible. Wherein, then, we may be asked, lies the advantage of the barbless variety? It is to be found in this—the barbless hook permits the careful angler to release practically any fish which he does not desire to keep without touch-

ing it with his hands. Small fish which might be seriously injured by a barbed No. 10 or even a No. 12 can be released without the slightest harm from a barbless hook of the same size.

There are still many waters in this great land of ours which are so amply stocked that there is no real excuse for fishing them with a barbed hook. The sooner the barbless hook comes into universal use, the sooner we can cease worrying lest the recreation of trout fishing be lost for our children. If your tackle dealer is not progressive enough to carry barbless hooks in stock, a small file will modernize and humanize your barbed hooks with neatness and despatch. A fly-tier's vise is a useful though not a necessary adjunct for such an operation on what ought to be regarded as the vermiform appendix of the old-fashioned hook.

EXCLUSION FROM COLLEGE

AMERICA sifts the immigrants to her shores. She not only rejects those whom she regards as unfit, but also has decided to limit the number of admitted aliens. In doing this she is not denying her democracy. On the contrary, she does it in order to preserve her democracy.

Similarly, every college sifts the ap-

plicants for admission to its student body. The mere fact that it does so is not inconsistent with a democratic spirit; indeed, it may be even necessary for its preservation.

No college is open to all comers. No college ought to be. No college can pretend to any standing unless it requires of those who seek admission the proof of their worth.

What constitutes such proof? That depends partly on the standards and purposes of the college, partly on the people to be convinced—that is, the college authorities—and partly on circumstances.

Each student in an American college is there, or is supposed to be there, for some other purpose than acquiring knowledge. He is to be the transmitter to others of ideals of mind, spirit, and conduct. Scholarship is perhaps the most strongly emphasized of these ideals, but it is not the only one, or even the one most generally prized. A college which is known to be false to the common ideals of sportsmanship, for example, is sure to suffer no less in the esteem of other colleges, and may suffer even more in public esteem, than the college which relaxes its standards of scholarship. In this respect the American college has not the restrictive aim of the German university, but the broader aims of the universities that have flourished for centuries in England, Scotland, and Ireland.

In America, too, the authorities in each particular college have a great deal to do in determining its character. The men who conduct an American college are predominantly men who have been trained in that particular college's ideals. The result is, in spite of the general American tendency to uniformity, a stimulating and invaluable variety within the whole educational body.

While in America the tradition as to ideals and the mode of expression of them through the authorities of the colleges have been preserved through generations, the circumstances under which the higher education of the country has been carried on have been completely changed. No greater contrast can well be imagined than that between the environment of Harvard in 1636 and the environment of Harvard to-day, or that between King's College when Alexander Hamilton was a student there and the same institution, known now as Columbia University, in the hard commercial atmosphere of modern New York.

The modern American college, therefore, has a threefold problem in admitting students. It must maintain its proved standards, it must retain its own individuality, and it must prove the capacity of the students for its standards

and for its distinctive service in accordance with the new circumstances.

In the old days, when America was but little advanced beyond the era of the pioneer and the small community, it was comparatively a simple matter to secure evidence that the applicants for admission to a college were fit to maintain its ideals. The candidate for admission could bring indorsements from those known to the college authorities and thus establish the satisfactory character of his financial standing, his mental capacity, and his moral attitude. In these latter days, however, when the old simple conditions have been supplanted by complexity and the old homogeneous communities have been displaced by a society highly heterogeneous, the old methods have not served. Today the boy's financial condition has to be assured by the presentation of a bond, just as it would have to be if he were applying for a position of trust in a corporation; and his mental capacity has to be carefully tested by a process of examination as elaborate as it is formidable. Little, however, has been done until recently to test the student's moral and personal qualifications. As a consequence, many institutions of learning, and particularly universities in large centers of population, have found that there are many individuals who have given bond and have passed examinations who are not by training or by qualities of character fitted to receive and carry on the ideals which those universities have been instituted to preserve. Those foundations of character which uphold the kind of standards that show themselves in human relationships like sport or business, and that make a college what it is in character and atmosphere, cannot be laid after the boy reaches college. They may be, and ought to be, supplemented by higher ideals and finer traits, but they themselves are laid in his early years in the family and the school. So fundamental are they that they are sometimes regarded as instincts. To ask a college to supply the student with these basic traits is to ask of it an impossible miracle at the expense of its own spirit.

With the incoming of a great alien host, America has found that many of her youth are without the fundamental training in the traditions of liberty and in her ideals which formerly were taken for granted. At the same time there are many of the youth of old American families who under the complexity of modern life have failed to receive that training from their parents or their teachers. There are many thousands of alien spirits in the bodies of native-born youth. Some of them are of native parentage; naturally, many more of

them are of foreign parentage. In those youth, however, there is often an eagerness for learning that drives them into the universities. It is one of the severest and most distressing tasks of college authorities to-day to exercise that discrimination which will keep college ideals and atmosphere pure and sound and yet not quench this eager spirit. In particular, among these alien youths—alien in spirit but not in body—are many who have their origin in eastern Europe, a majority of whom are Jews. The fact that in their endeavor to maintain their standards the wholesome discrimination exercised by college authorities may exclude a very large proportion

HARRY L. DAVIS, GOVERNOR OF OHIO

"DEATH BY LAW"

There was a time when the violation of almost any law of God or man was punishable with death. In the reign of Henry VIII, history tells us, 72,000 petty thieves were executed. In the course of centuries society gradually reserved this supreme penalty for the most abhorrent and atrocious offenses in the catalogue of crimes, until to-day, in practically every State where it continues, it is largely confined to cases of first-degree murder, treason, and, in some cases, rape and train robbery.

It has been estimated that in the last thirty years the American people have put to death 4,000 criminals. With that figure in mind, is it not fitting that we ask ourselves the question whether capital punishment has proved successful in the light of practical experience, and whether it is in keeping with advanced thought and our innermost conception of right and wrong?

This is the searching question which the able Governor of Ohio asks the American people. His article, which will appear in an early issue of *The Outlook*, presents a profound analysis of the situation as it exists. The conclusions which he reaches are those of a courageous humanitarian, not those of a sentimentalist.

of these particular aliens ought not to be regarded as a reflection upon the colleges; it ought to be understood as a natural and inevitable consequence of the immigrant tide. It is one of the consequences of that tide which have been felt by the whole country. We cannot, and ought not to try to, ignore the question whether the Nation itself has not come into the peril of losing some of its own ideals through the very process of allowing, in what it supposed to be obedience to those ideals, oppressed or enslaved peoples to swarm upon its shores and thus to permit ideas born of slavery and oppression to displace the Nation's ideals themselves.

Racial and religious oppression and prejudice have no place in America, and least of all in academic environments. But the effort to maintain standards against untrained minds and spirits is not oppression or prejudice. The sort of discrimination which is alleged to have been displayed by the midshipmen of the United States Naval Academy in ostracizing a Jewish member of the graduating class is the very antithesis of the sort of discrimination that ought to be exercised by academic authorities. If the authorities truly exercise their discrimination, they will inevitably admit many Jews and foreign-born and aliens, and as inevitably exclude many youth whose ancestors have been American for generations. If such care is exercised as will preserve the spirit and ideals of a college, the problem of undergraduate ostracism will be easily solved. One of the significant facts in connection with this whole discussion is that, while newspapers, apparently ignorant of academic ideals, have been interpreting a recent resolution of the Board of Overseers of Harvard University as discrimination against the Jews, one of the members of that Board of Overseers is a Jew. The idea that Harvard University, because it is seeking to maintain its standards, is about to embark upon a career of religious intolerance and racial oppression is born of a strange and inexplicable unfamiliarity with Harvard's history, and in fact with the traditions of American universities in general.

Criticism, even though some of it may be ignorant and passionate, can perhaps serve as a warning against any abuse of academic authority; but it should not deter the colleges of this country from maintaining the highest practicable standards, not only intellectually, but morally and culturally, and in requiring of all applicants for admission proof of fitness for their part as undergraduates in carrying forward the character and ideals which are intrusted to their keeping.

WHAT ITALY THINKS

SPECIAL CORRESPONDENCE FROM ITALY

BY CARLO BEUF

WE wonder, sometimes, why Italy, which is a nation of over forty million inhabitants, is not understood as we would wish it to be. But I am convinced that this doubt is caused by our love for our country, and when one loves one never thinks that others sufficiently appreciate the object of one's affections. Here we have somewhat the impression that you come to our country only to see our museums, our churches, and to take inspiration from the great past. I am certain, however, that this also is a mistake, and I believe that if modern Italians are less known to you than other peoples a great part of the fault is ours, who, though having merits (which were sufficiently demonstrated during the war), do not take enough pains to make ourselves understood.

To understand modern Italy it is necessary to go back to the antique. It is inevitable. Our history is so bound up with our actual life that it is impossible to understand one without studying the other a little. Therefore to talk to you of the Italians of to-day I must commence two thousand years ago! Do not take fright; I will be brief.

We have had a great history; the world has not forgotten it. The history of Rome is studied by all, from children in school to the institutes of archæology which you have so cleverly organized. Our Renaissance is revived again in your universities and splendid museums, where patrons of art, not unworthy of their Florentine and Milanese predecessors, have collected the best they could find in our old Europe.

Rome created the type of the great modern state. Its organization is the marvel and astonishment of students of politics and statistics. (The solidity of the constitution of the Catholic Church is a proof and confirmation of this, as it is formed along the lines of the Roman Empire.) The way in which Rome governed its colonies can serve to-day as an example to England. But after the fall of the Roman Empire dark shadows gathered over Italy, shadows that seemed even darker compared with the brilliancy of the short sunset. But even in the shadow of the Middle Ages one cannot say that Italy had been exhausted by the immense effort of her conquest of the world; she lay in a drowsiness from which unexpected reawakenings proved her tenacious vitality. After, came the conquest by the barbarians and the laceration of internal wars—sad wounds which delayed for so many centuries the unification of Italy in a free state. But whenever attacked by a common enemy all united against the invader. The ineffectual effort of the German Empire in the Middle Ages to subjugate Italy consumed itself in

vain against the multifarious life of our people, and is the best example of our vitality.

If during the period of the Renaissance the internal quarrels still characterized Italy, the power of its genius flew to such heights as to renovate the glory of Athens. Her art was the greatest; the first banks were Italian, and had their branches everywhere; the Florentines were the official diplomats of all the kings and states in Europe; Venice and Genoa dominated the sea; and one of her sons signaled the end of an epoch by the discovery of the new continent. The sixteenth century is the highest point of the parabola of Italian genius, but, in spite of this, at that time general political conditions in Italy were disastrous. The French invasion succeeded the Spanish, and the political disunion of our country caused it to become the general battlefield for all. From then on was the epoch of great nations; little ones had no more *raison d'être*; and with the end of this century intellectual superiority waned. Already Germany had taken from us the supremacy in thought; France was politically consolidated into a great nation; England was making her place in history by her conquests on the sea. For two centuries no one thought of Italy except to contend for some of her lands or cities. But even during this period the torpid condition of Italy had its reawakenings that still testified to its ancient strength, and great figures like that of Galileo stand out in their epochs. The French Revolution caused violent movements here in many cities; movements which, even though they were instantly suppressed, and therefore had no immediate results, can be considered the commencement of a reawakening that was to bear fruit in the following century.

The nineteenth century was born under the Napoleonic buckler. The realm of Italy founded by the Corsican, if in reality only a parody of that which it should have been, nevertheless suggested to the Italians that something more than the walls of their cities existed and that above their own local interests there was the common cause of Italy, and that from the Alps to Sicily they all spoke the same language and belonged to the same race. From this realization the struggle for the attainment of our national aspirations began. First with the works of a few intellectuals, then the people took part, and finally the whole nation, with Mazzini, Cavour, Victor Emmanuel, and Garibaldi at its head, became free.

Now you will ask me why I have told you all these things which every one knows, or which every one at least has once known even if afterward they have

been forgotten. It is just for this latter reason that I make a brief historical summary, for to know the Italy of to-day one must not forget the Italy of yesterday. Already in this synopsis two principal characteristics stand out; one is good, the other is almost bad. The good lies in that inexhaustible vitality of our race; the bad is the excessive impetus that the Italians put in party spirit, that violence which makes them sometimes subordinate higher ideals to their factional feeling. Only by holding in mind these two distinct characteristics and their origin will a foreigner understand a great many otherwise unexplainable facts in our contemporaneous political life.

There are certain social movements which, because they are born of a common root and are similar in certain aspirations, are called by the same name in all countries, though often substantially dissimilar in different nations, for diverse reasons, historical, ethical, political, etc. So it is, for example, with Socialism. Between the Socialism of the United States and the Socialism of Italy there is an immense difference. It could not be otherwise. With us, as in France, Socialism is originally anticlerical. It is logical that it should be so; its materialistic philosophy, which is in direct opposition to the principle of any faith, and its revolutionary spirit, which is the antithesis of clerical conservatism, must inevitably clash with the Church. The encounter on the part of the new party was violent, as every neophyte is violent. Guelfism came to life again as a sustainer of the Church; and Ghibellinism, inasmuch as it is against the Church, on the side of the Socialists. As I have said, Italy is eminently an agricultural country; the peasant is profoundly religious, and because he is slow in his evolution is naturally conservative. From this came the difficulty which the new party found at the beginning of its campaign, as a contrast to the small resistance opposed by the industrial regions of the north and center. In this fact is found the explanation of the appearance of another party—the Popular party, which in a few years has succeeded in obtaining an important representation in Parliament. The Popular party, notwithstanding the Holy See's repeated declarations of neutrality, is the Catholic party, favorable to the Church, depending spiritually, if not politically, on it, which is a great deal. The Church, like so many other historical forces, once again fights its enemies with their own arms, and after studying their weak points uses them for their reconquest. As I have said, the weak point in Socialism was at the beginning in the country, but little by little the

country was drawn into the orbit of Socialism, when the new Popular party, taking advantage of the Red propaganda, turned to its own ends that same propaganda, initiating an ultra-democratic movement, even almost Communistic, on the false line of the first, but under the wing of Catholicism. Here one must notice another fact in order to understand about still another party, which, though not numerously represented in Parliament, is nevertheless much talked of abroad because of its activity, and about which, I think, foreigners have not yet an exact idea. The war in Italy, as in all countries, had reawakened the spirit of nationality, or that hypersensitive national characteristic of the belligerent countries. This reborn patriotism naturally conflicted with the Socialistic party and the Socialistic-Popular party; out of this conflict came the *fascismo* form of mili-

tant nationalism, substituting federal authority to uphold the national interests.

This is a brief synthesis of the extreme parties in Italy, each one of which, as you see, finds a profound reason for its expression in characteristics essentially Italian, even if similar in some way to social movements in other countries. The Socialistic phenomena, which have now reached maturity, lose their character and become *bourgeois*. The principal characteristic which distinguishes them from the Socialistic movement in America is the struggle with religion, here accentuated because Italy is the seat of the Catholic Church. The Popular party, created to combat the Socialistic movement in the name of the Catholic religion, has its cause of origin in the fierce struggle for existence sustained by the Catholic Church, which characterizes its history through centuries: the struggle with the

Empire, with the Reformation, and with the French revolutionary ideas of which Socialism is in a certain way the spiritual son. From the after-war disillusionings and from the anti-Socialistic disintegration of the State has arisen the *fascismo*. The smallness of politicians and the dissatisfaction provoked by the apathy which followed the heroic effort of the war contributed to its formation.

It was natural that after a cataclysm such as the war and the displacement of national values the return to normal equilibrium should be characterized by violent internal conflicts, and that the ancient passions, become drowsy through so many years of peace and prosperity, should sometimes fiercely reappear. Now, however, there are the unmistakable symptoms of a return to the normal state, which the economic rearrangement cannot help but hasten.

Genoa, June, 1922.

THE BOLSHEVIST GAME OF OIL; OR, HOW TO KEEP YOURSELF GOING

EDITORIAL CORRESPONDENCE FROM EUROPE

BY ELBERT FRANCIS BALDWIN

A WEEK before the opening of the Genoa Conference I was talking with one of the largest of oil operators. He confirmed my opinion that the question of the disposition of petroleum lands in Russia would be present in the minds of all whenever Russia was discussed there or in any similar conference.

Certainly it will be true of the coming Conference at The Hague.

Who knows? Perhaps the solution of this problem formed a potent reason for the summoning of both Conferences.

The oil fields in question, excluding those of the Ukraine, are:

(1) The Baku basin, on the Caspian Sea, connected by a pipe line with Batum, the Georgian port on the Black Sea.

(2) The Grosny basin, connected by a pipe line with Novorossisk, situated farther north, on the Black Sea.

(3) The Maikop basin, between Grosny and Novorossisk and connected by a pipe line with Novorossisk.

(4) The Emba basin, to the north of the Caspian Sea.

Before the war two-thirds of the Russian oil came from the Baku basin and only about sixteen per cent from the Grosny basin. Since then, however, the Grosny basin, it is claimed, has become the more important. The Swedes (the Nobel Company) operated chiefly in the Baku district and were the principal producers of naphtha in Russia.

We Americans are interested in the development of Russian oil production because of the world interests of our own oil companies; in this instance, of the Standard Oil Company. Two years ago the Standard bought a half interest

in the Nobel Company; hence the Standard and the Nobel became equal owners of the Russian Nobel properties. Later came the Standard's formation of a French company. And now, it is stated, the Belgian company of Grosny is placing itself under the Standard's control.

Facing them is a formidable rival—the Dutch-English combination; that is to say, the Royal Dutch, Shell, and Anglo-Persian companies, the last named being partly maintained by the British Government, so that it will always have enough fuel oil for its navy. In addition a German group, organized by the Deutsch Petroleum and the Deutsche Bank, is ready to collaborate with the Dutch-English group.

The Bolshevik aim has always been to divide the Entente and Europe. Hence the Bolshevik Government is delighted at this division of interests; on the one side the English, the Dutch, the Germans; and on the other, the Americans, the French, the Belgians, the Swedes.

The latter group fears that the Bolshevik Government, having seized and nationalized Belgian, French, and Swedish-American properties, may include them in the territories now being ceded to the Dutch and English.

To this the Shell Company, in particular, says that since the Revolution of 1917 it has been continually trying to regain possession of its Russian territory, but that it has refused to assent to plans which would have invaded the spheres of other companies.

If our interests are menaced—and this would seem certain—the American Government will doubtless act as befits our

self-respect. In any case, we must protect, wherever possible, our rights of liberty of trade and the "Open Door" as well as respect for property rights.

It was in this spirit at the Conference of Genoa that Belgium and France refused to compromise with crime, as they would have done had they signed the famous memorandum handed to the Bolshevik delegation, a document apparently sanctioning under certain circumstances some of the Bolshevik Government's thefts of private property.

These thefts, as far as oil properties are concerned, have been particularly outrageous in the Baku basin, where they were controlled by the Government of Georgia, erected by the Georgian people after the Czar's downfall and recognized *de jure* abroad. The Bolsheviks annihilated that Government, not only because they wanted Georgia for themselves, but especially because they wanted to help international capitalists and specialists to obtain the oil lands there. The Bolsheviks therefore massacred the Georgians, so that the Bolshevik Government, untroubled by an obstreperous state, could hand over the riches of Georgia into the grasp of future exploiters—for value received. In such ways the Bolshevik Government continues to exist.

At Genoa there was a disposition—will there be at The Hague?—to treat the question of Russian oil without paying attention to the prostrate Georgian Government or to the defrauded Georgian people. What, then, may I ask, has come of that famous principle of self-determination?

SIGNOR
MARCONI.
THE
CELEBRATED
ITALIAN
INVENTOR.
AS HE
ARRIVED
IN NEW YORK

Signor Marconi is here seen in the wireless room on his yacht Elettra when it anchored in the North River after a trip across the Atlantic. He has recently reported the discovery of a method by which the direction of radio waves may be controlled. It is expected that this will lead to the erection of radio "lighthouses" for the assistance of navigators and that it also can be used to eliminate a great deal of the interference that now hampers radio communication.

FINGER PRINTS ESTABLISH IDENTITY OF MOTHER AND CHILD

Here we see the first mother and child to be finger-printed at the Lying-In Hospital in New York City. Left to right: Deputy Commissioner Faurot, finger-print expert Dr. Asa B. Davis, and Dr. Royal S. Copeland

SEE GERMANY LAST

BY JOSEPH DANZIGER

ARE you contemplating a trip abroad where the rate of exchange provides a hatful of money for an American bill of small denomination? Is Germany, with her quaint towns and pleasant cities of bygone memories, also on your itinerary? I would like to make one little suggestion on your way:

"Don't!"

The traveler may not see any considerable change in outward appearances unless he knows Europe as well as his home State. Theaters and museums offer attractions in greater number than formerly. Neither restaurants nor cafés have decreased in quantity, though the patronage has changed radically. Few cultured people have any money for luxuries. The new-rich are the chief patrons of the better-class restaurants, and it is no unusual sight to witness some diverting feats of knife-swallowing at an adjoining table.

Before your steamer is permitted to dock at a German port a horde of police officials come aboard. They look very pompous and each one is girded with a long sword, which he unhitches and lays menacingly on the table in front of his seat. The stewards then marshal the passengers in the salon, where they must stand in line for hours while the examination of passports progresses.

German and Austrian passports are examined first and quickly disposed of. Americans have to wait until the favored nations are served. Each American passenger must submit to a meticulous inquisition regarding his personal affairs—his purpose in visiting the country, profession, annual income, amount and character of funds brought along, probable length of stay, religion, when, if ever, he was convicted of crime or misdemeanor and amount of fine or imprisonment, if any; when, if ever, traveler has previously lived in Germany, and whatever additional information the official imagination suggests as likely to be impertinent or annoying. This is the traveler's first welcome to the New Germany which he has been led to believe is now under a republican form of government. It is a form of greeting particularly directed at Americans, to convey to us that we are not desirable acquisitions for Europe, even though we have plenty of money.

The customs examination is even more irritating, though I personally had no reason to complain. When I landed from the ship, my room steward was intrusted with my hand baggage and definite instructions. He sought out a certain dock porter, to whom I slipped a greenback of modest value. That was all that was necessary. I was not required to open a single piece of our baggage. The ruthlessness of our own customs officials has been the object of many bitter invectives by Americans

as well as foreigners. I have passed through the port of New York many times, and have witnessed some rather thorough scrutinizing by the customs officials at the Paris *gares*, but never have I seen such brutal disregard of a primitive sense of decency and consideration as was displayed by these German customs officials. The dock looked like the scene of a Bolshevik uprising. Scattered along its length were conglomerate heaps of millinery, shoes, blouses, clothes, and intimate details of feminine attire which distracted ladies were trying to cram back in their trunks. These unfortunates had neglected to smooth the way with a bit of "dollar money," as the Germans call it.

After the examination was completed the boat train pulled out for Bremen. We found all the best hotels full, and only after tramping the town secured accommodations. The traveler soon learns that this condition prevails everywhere. The housing famine forces many to live in hotels who would find shelter elsewhere under normal conditions. One feature of our room was characteristic of nearly every other one we engaged. It was chilly. Not the honest cold that I have known in unheated Russian hotel rooms during the war, the cold that pierces you to the marrow and causes you to sleep like a log.

I am not saying that Germans fail to pay attention to personal cleanliness. All Teutonic people bathe just as we and the Anglo-Saxons. Every German apartment has a bath, although the baths are not so well appointed as ours. But present conditions are abnormal. Soap is a very expensive article, and even in the best apartment-houses the coal shortage limits the furnishing of hot water to one day in the week.

Therefore, if you are riding in a second-class compartment, it is well to open the window, even though it is necessary—and it will be—to fight the other passengers in doing so. Have you ever observed the bitter resentment the traveling European exhibits toward fresh air? We got into a crowded train one pleasant autumn morning and took the last unoccupied seats in a second-class compartment. The passenger next to me put his hand on the window-pane and observed, to his horror, that part of the pane was gone, not an unusual condition here. He shuddered, although it was by no means cold, arose, put on his overcoat, thrust his head through the window, and denounced the station-master, who was sauntering by, for using damaged equipment. Then he demanded that a new pane be inserted, "on the spot." From his spirited insistence I judged he must have been a *Geheimrat*—or something. However, minor officials do not cringe the way they did before the revolution. The station-

master merely shrugged his shoulders and stated the equivalent of "it can't be did."

"Unheard of!" fumed the *Geheimrat*, which words are considered awful strong language in German. The *Geheimrat* left the compartment, and I slid into his seat. He was followed by the other passengers.

One after one,
Too quick for groan or sigh,
Each turned his face with a ghastly pang,
And cursed me with his eye,

because I was so evidently enjoying the proceeding and the fresh air. We had a compartment all to ourselves during a five-hour trip.

A few days' stay in Bremen taught me the two determining principles of shop-keeping in the New Germany. One is, "*Caveat emptor*"—let the purchaser beware; the other, "Soak Americans." There was a fine old meerschaum pipe in a tobacconist's window, and I went in to price it. Of course before ever I opened my mouth I was recognized as an American—by my shoes, the cut of my clothes, or more likely by the absence of Prussian rigidity. At any rate, I was told that the price was 2,500 marks, not so much in real money when you come to figure it, but I had learned to be wary. I protested that the price was too high.

"Oh, that is no price at all in American money," quoth the salesman. He was right at that, but this remark grates on you when you know it is merely an excuse for overcharging. I sent a German acquaintance in the next day, and he got the pipe for 600 marks. The incident is typical of what happens to Americans whenever they go shopping. There is a special scale of prices based on our rate of exchange.

Perhaps the ladies are less concerned about being the marked-down victims of extortion than they are with what can be bought. Germany no longer furnishes the silks that once made her looms famous in Bond Street and the Paris boulevards. My wife wanted to have a blouse made, and scoured the Berlin shops for an adequate piece of silk. She reports that she could have got ever so much better material on Fourteenth Street in New York, not to mention the high-grade localities. Nevertheless table linens, laces, and lingerie are still to be had in excellent workmanship and at low prices. I needed a suit, but could find none that any respectable dealer would assure me was all wool. So I went to a disreputable one—there are legions of them in Germany now—and he sold me a suit that he said was all wool. I think he was too optimistic, and will only add that if I can get a tailor to press that suit back in the shape it had when I bought it I will sell

it to a second-hand man. No one would buy it in its present condition. Raw wool and silk must be bought abroad and paid for in gold, which is the reason these materials are used so sparingly.

In Berlin the hotel situation was worse than in any other place. There was a taxi strike when we arrived. It is a dull day indeed when some sort of annoying strike is not in progress. Travelers were entirely dependent upon rickety *Droschken* driven by villainous-looking cabbies and drawn by little Russian ponies in the sere and yellow leaf of decrepitude—the notorious Paris cab-horse is a fiery, untamed Arab in comparison. The upholstering of our cab was filthy and bursting from its worn covering, and the windows were broken; the entire vehicle could have scarcely experienced a wash since the war began. In this conveyance, languidly drawn by the stiff-legged, bony old nag, we made the cheerless round of the hotels. The Adlon, Bristol, Esplanade, Fürstenhof, all were full. We finally reserved a room at an equally famous hotel. It was to be put at our disposal by four o'clock. The room was small, without running water or bath, and inadequately heated, but we took it in the spirit of "any port in a storm." The price was five hundred marks, which at the time we thought was not unreasonable, notwithstanding the limited accommodations.

When the bill was presented several days later, we learned that this was merely the basic price. In the first place, there was a surcharge of one hundred per cent for Americans. All foreigners must register their nationality and are subject to a surcharge, but Americans are taxed heaviest, because our money bears the highest rate of exchange. This increased the basic price from five hundred to one thousand marks, or about five dollars for a room that any New York hotel of the same standing would be ashamed to offer a guest. In addition, there was a 25 per cent charge for service, 20 per cent for depreciation of linen, 20 per cent municipal tax, 4 marks for hot water in the morning, 1 mark for each sheet of paper and envelope delivered, and 6 marks as a penalty for failure to eat and pay for the unappetizing breakfast. We preferred to patronize a near-by pastry shop where the coffee was tolerable and hot and the eggs fresh.

While our room was being put in order we were told that the only safe place to leave our hand baggage was with the *portier*. This functionary is not the head porter, but a sort of managing clerk. We were given no claim checks, but I watched the *portier* himself supervise the stowing of our baggage, after which he locked the room and put the key in his pocket. Later on, when we wanted our things, I had to point them out among a pile of others. This system is based on the assumption that every one is honest, an assumption that the facts fail to justify.

"Perhaps the gentleman left the bag on the train," the *portier* replied to my

complaint about a missing hand-bag, addressing me in the third person, a way they have of pretending to be polite when they really are impertinent.

"Or the cab-driver may have stolen it. Oh, these cab-drivers! They are not to be trusted."

That last remark was "a mouthful." Cab-drivers are not to be trusted, nor any one else, high or low. Those who are not in a position to graft go in for plain stealing. The chambermaid advised us never to leave any article lying about in the room. Everything must be kept under lock and key. Sneak thieves were registered as guests in all first-class hotels, and they roamed the corridors with an eye particularly to the rooms occupied by foreigners.

The general sense of honesty abroad was never very strong. In former times if an American boasted that a sixty-story office building was a commonplace in our cities, his listener would nod and say he had heard about them. If he were told that American trains go two hundred miles an hour, he would not regard this as surprising—for America. But if you ventured to remark that it is a common thing to walk up to a newsstand in the absence of the attendant, select your own papers, make change out of the pile of nickels and pennies, and go your way, then he would know you were a liar. No person would possibly trust his fellows that far.

Now that the lid is off in Germany you are constantly reminded that you have fallen among thieves. Even in the best restaurants and cafés you will observe placards cautioning patrons to beware of coat thieves. The check-room affords little protection. In the theaters it is obligatory to check your outer garments. You are fairly safe so far as coat and hat are concerned, but while the performance is going on the coat-room attendants can, and do, go through all the pockets at their leisure.

On the evening of our arrival I met a police prefect whom I had known during the war. I asked him how we were to get our heavy baggage from the station. Owing to the taxi strike, the transfer company could not promise delivery in less than five days, which probably meant ten days if you know how Germans regard time as a non-essential of the contract. My question excited the prefect's anxiety.

"For heaven's sake!" he exclaimed, "do not dream of leaving your baggage over night at the Lehrter Station! The place is infested with thieves who keep a special watch for the baggage of Americans coming from Hamburg and Bremen. I would not give a hundred marks for your chance of finding it in the morning."

There was nothing for it but a hurried drive back to the station, where I took out an insurance policy and saw our property placed in a locked room. After many weeks of such experiences the sense of insecurity becomes an obsession, which robs you of the pleasure you formerly derived.

Before the war the German police were notorious for their brutal disregard of their fellow-subjects, although they treated foreigners with some consideration. I naturally supposed that under a republic these conditions would be improved, but soon learned differently. On the third day after coming to Berlin we received a written order to appear at the police station between twelve and two. I found the appointment inconvenient, and did not keep it. I have learned from experience that the more cavalierly a German police official is treated, the greater respect he acquires. He reasons that no one would dare act in this way unless he had a pull, and his reasoning is correct when applied to the Germans. The next day I called at the station, and witnessed a terrible ragging that an official was giving a neatly dressed Russian. The young man explained that he was unable to bring his father's birth certificate because the old gentleman was sick somewhere in Russia, and at best it would take ten days or two weeks to get a copy of the document. The police official roared savagely at him, threatening to have him deported unless he furnished the certificate forthwith. The young man swore by all the saints that he would do his best, and left very much crestfallen. Of course the official knew that he could not get the birth certificate, and he also was aware that this was superfluous so long as the registrant's own papers were in order. Then the official turned to me.

"You were instructed to appear here yesterday," he growled truculently after I had given my name.

"See here," I said, coolly, "my passport was properly viséed by the Consulate in New York and examined and stamped by the port officials here. This included permission for me to stay five months in Berlin. I am a journalist, and my time is very much taken up. I don't care to waste any here. What do you want? I filled out the usual information blank at the hotel."

"The Herr must bring six photos of himself and his lady-spouse, who is also obliged to appear in person," purred the official, completely subdued by my insolence. "The regulations require that identification cards must be on file for the Herr and his lady-spouse during their stay in Germany. Perhaps the Herrschaften [untranslatable, but complimentary] will find it convenient to call to-morrow with the photos?" I said I would see about it, and left.

The next day my wife and I appeared before the tamed German police official. He apologized because it was required of him to ask a few questions. Then they came. About the same ritual as on board the steamer, only a little more searching.

It does not seem unreasonable that the police might be engaged in some better business than annoying foreigners who have come with the sole intention of enjoying themselves and incidentally spending their money in the country. The number of burglaries and hold-ups

that occur every night would suggest the pursuit of criminals as a logical activity for the police. These robbers operate unmolested; they travel about in gangs of four or five, as they are too cowardly to attack singly. As a rule the victim of a hold-up is seriously wounded with knife or revolver, and it is often the case that he loses his life. The German criminal does not face his victim with the command to stand and deliver. He attacks in mass from behind and renders his victim helpless with knife thrusts or revolver bullets. Just this week a stranger was hacked to pieces and his wallet taken by a gang of thugs within two blocks of the liveliest night life in downtown Berlin.

Another sight which does not contribute to the joys of city life are the ranks of war-beaten men that line the most populous streets of every German city. The only thing the Socialist Government will do for them is to let them expose their calamities to the public gaze in an appeal for alms. They constitute extreme but not incongruous details of the social life. They harmonize with the barricaded or emptied shop windows at night, the dull, half-lighted streets, the listless crowds in cafés and cabarets who vainly strive to resurrect the old gayety long after its spirit has fled.

The Germans themselves are living in

splendid misery when it is not abject poverty. The professional and business man clings to outward appearances desperately and tenaciously. It is his last hold on respectability. He will spend money on shoe polish, though he must deny himself a pound of bacon. The women insist upon keeping their big apartments, designed for a period when servants could be had for a song. Now they cannot afford even the expense of a servant's food. They work their fingers to the bone; they take in roomers, disguised as visiting relatives. Life for these classes has become a mere struggle for existence.

Go to a cabaret of the more respectable sort where such people congregate. Abject despondence can be read in all their faces. Half-forgotten habit makes them laugh, applaud, drink to each other's health, but the smiles are only with the lips, not the eyes. The old convivial spirit is no more.

Then too there is another factor which should not be overlooked by the tourist. Present conditions cannot last. The recent railway strike tied up every car-wheel in Germany. Berlin was without lights; the stock of candles was soon exhausted. A general strike was looked for any hour. It passed off. But tomorrow, next week, possibly not before a year, the eruption will surely burst

forth. Foreign and native observers are agreed that another upheaval is sure to come. The masses are too desperate in their despondency to care whether it comes from the Left or the Right.

When it comes, woe to aliens, especially Americans! Behind the mask of their smiling greetings they hate us more than all the rest. They do not hate us for our part in their defeat, but it is hatred born of envy, because we are young, vigorous, thriving, while they are senile, debilitated, and spent. Whatever little ability to think in political terms the Germans ever possessed has been perverted into hatred and envy of every foreigner, Americans above all.

When the storm breaks loose, as it surely will, when the rat-faced hordes pour down from the northern faubourgs to glut their vengeance on the fat and prosperous profiteers of the West End, I would want no friend of mine to be in Germany. Every American is my friend as I sit writing here amid the snow-clad Harz Mountains. Stay at home, friend! There are southern California, the Yosemite, Yellowstone, and Glacier Parks, the Great Lakes, the Adirondacks, the Maine coast, and a myriad of nature's marvels lying in between. Old Europe is *in extremis* now. You will not find the pleasures you have known in other and happier years.

GETTING LOST IN THE WOODS

BY ELON JESSUP

BEING lost in the woods is one of the most terrifying experiences which can come to a person. Sometimes it proves fatal. A certain number of tragedies of this sort occur every summer. Yet to lose one's bearings in the woods is in itself very seldom a serious matter. Almost every one gets lost sooner or later, at least for a few minutes. It is losing one's head as well as bearings which proves fatal.

Why do people get lost? There are many reasons. Among these are going without a compass and walking in circles, panicky doubt as to the veracity of a compass even when one is carried, total lack of sense of direction, scant powers of observation, neglect in carrying maps, and the vague wanderings of the human mind.

The average backwoodsman seldom uses a compass at all. And woodsmen, as well as city folk, get lost in the wilderness. When a woodsman gets lost, it is usually because he has placed implicit faith in his instinctive sense of direction to the elimination of all other safeguards. All his life he has thought exclusively in terms of north, south, east, and west. It is said of him that he *feels* the north. Certain it is that his sense of direction is developed to a remarkable degree, and this is an extremely valuable quality for any one to possess. But it is not infallible.

The average city-bred person has a poorly developed sense of direction. He seldom thinks in terms of points of the compass. He talks about walking "up street" or "down street," rarely about going east or west. And when he goes to the woods he is no match in sense of direction for the man who *feels* the north. Let him realize his handicap and make use of less fallible tools.

Maps are enlightening tools. There are two kinds of maps. One kind is a representation on paper of a given section of territory. The most comprehensive of these are the Government topographical maps. The surface of the ground is depicted in miniature upon paper, but the scale is so relatively large that great detail indicative of the character of the country is clearly shown.

The other kind of map, although not so comprehensive, is fully as valuable and may be used to advantage in conjunction with a paper map. This consists of first-hand knowledge of the markings of a section which one sees with one's own eyes and then stores away at the back of the head for future reference. A clear-cut mental map of this sort is one of the greatest safeguards against getting lost. There are always certain landmarks which make an indelible impression. A sharp gray cliff here, a lone towering pine there, and the relative position of each from

the spot where one may be camped should be carefully noted and remembered.

In the same way, one should acquire a mental image of various trails, note the prevailing direction which these take in relation to the points of the compass, consult the paper map and find out the ultimate destination of a certain trail which vanished from your vision, beyond the horizon. Make mental note of the direction in which certain streams flow and consult your paper map to find what they flow into; memorize the relative positions of certain ponds, lakes, and ridges. The more keenly you develop your powers of observation and individualize your landmarks so that these are always readily recognizable, the smaller the chances are of getting lost.

No one should enter the woods without a compass. This valuable little instrument may be used in conjunction with either paper map or mental map or both together. Oftentimes it is the only guide which can make you toe the mark and walk straight.

Human legs when left solely to their own wanderings have a profound distaste for walking in a straight line. This fact is one of the fundamental reasons why people get lost in the woods. There is a constant tendency to walk in a continuous series of arcs, and fre-

IN THE DEEP WOODS

quently one discovers, to his astonishment and chagrin, that, instead of walking in a straight line to his destination, he has described a large circle and is back at the starting-point. This oddity of forest travel is one which must be constantly guarded against. The compass performs the valuable service of keeping you in a straight line.

The almost universal human tendency to walk in circles when in the woods has given rise to considerable discussion around many camp-fires as to the reason for this phenomenon. One theory sometimes advanced has it that one leg is always a trifle shorter than the other and that the short leg pulls one aside in that direction. This theory I consider quite absurd.

It is more logical to suppose that the phenomenon is due to a combination of forest obstacles and human habit. With the absence of a well-trodden trail underfoot, one is constantly walking around stumps, trees, rocks, and similar obstacles. Of course if one turned aside first to the right, the next time to the left, and continued to alternate evenly, matters would average up so that the result would be a fairly straight line. But if the first time one turns aside to the right, the human tendency is to turn in that direction the second time.

Habit being as it is, the body gradually swerves in a predominating direction and presently numerous arcs have become a circle.

A highly developed sense of direction, the capacity for visualizing and memorizing familiar landmarks, a paper map, and a compass, are each individually a valuable element in finding one's way through the wilderness. When all four of these elements are made use of together, the possibility of getting lost is minimized to that proportionate extent. Yet the fact remains that this possibility can seldom be reduced to the point of absolute security. The human element always remains. The memory may slip a cog, the mind may temporarily wander, and mind and feet are so closely correlated that one of these is guided by the vagaries of the other. A single slip may be enough to lose one. A moment of inattention or carelessness will bring this on.

Any one who starts out for a few hours' stroll through strange woods should bear in mind this ever-present possibility. In addition to carrying a compass one should make it an undeviating rule never to be without a supply of matches, and, if practicable, one should also take along an emergency lunch. If forced to curl up without blankets for

the night under a tree, it is comforting to one's body and spirits to have a fire to keep warm by.

That which happens when a person is lost is that a gap has occurred between known surroundings, a thread has snapped. Your mind has wandered momentarily off your straight line and your feet have followed suit. Perhaps you suddenly become uneasily conscious of the fact that the horizon has been turned around; a moment before the sun was at your back, and now it is in front. Such a discovery invariably comes to one as a shock, but as a rule a familiar landmark is presently recognized; this serves as a means of bridging the gap and no harm is done. On numerous occasions I have been lost for a few minutes at a time in this manner. Almost every one who goes to the woods has. But even getting lost in familiar surroundings may have serious consequences unless one keeps a level head.

Within any lost person there are surges of fear, helpless terror, and panic, which are never so very far below the surface. These evil spirits are constantly striving for mastery. Their presence first asserts itself in the shock one feels upon realizing that one is lost. There are some people who break down completely under the force of that first

shock, but as a rule a person pulls himself together and proceeds to bridge the missing gap. So long as one remains lost, however, the evil spell of panic is smoldering within him, and the longer one is lost the more difficult it becomes to hold it back. I was once lost for three days in the wilderness, and during my bewildering floundering I sensed those evil spirits which were striving for mastery; more than once I felt them clutching at my throat.

The reason why I came safely through this ordeal was that I knew the most important of all rules for a person who is lost in the woods. This rule is, "Keep your head and save your energy." So it was that when I heard the uneasy rumblings within I forthwith said to myself, "Keep your head," and then sat down, rested, and reasoned matters out.

The psychology of getting lost in the woods should offer a unique field of study for scientists. I know of one case of a man carrying neither food nor blankets who was lost in the wilderness for a month, and then came out smiling. On the other hand, I know of another man who went for a day's climb with a party of friends in the mountains. They were following an unmistakable, well-trodden trail, but he happened to lag a few yards behind, and he suddenly became conscious of the fact that he was alone in the woods, there was no one in sight. Instead of calling or speeding his steps a trifle in order to catch up with his friends, unreasoning panic took full possession of him and he ran wildly, as fast as his legs would carry him, off the side of the trail and through tangled brush down the side of the mountain. By merest chance, he happened to stumble upon a road at the bottom, and this brought him to his senses. But for this fact things would have gone badly for him.

From a purely physical standpoint, there is no actual danger from the woods. Provided one carries matches and knows a few edible plants, roots, and similar resources, one can survive in the forest for weeks at a time. The real danger from the woods is spooks, the terrible mental imaginings which may flog a person into rushing wildly in circles or every direction but the right one, and thence to total exhaustion and death.

Yet why is it, I wonder, that even an experienced backwoodsman who can with perfect physical ease subsist solely upon what the forest has to offer feels at the same time a sense of lurking terror upon discovering that he has lost his bearings? He knows very well that in due course of events he will find his way safely back to his cabin, and in the meantime he keeps his head and does not allow the evil spirit of panic to master him, but the fact remains that the evil spirit is present within him although safely submerged.

When unreasoning, helpless terror takes full possession of a lost person, there is usually little hope for him unless he manages to pull himself together

or outside help arrives. I recall an instance of a man who had been missing for two days from a camp in Nova Scotia. His friends organized a searching party, and in time came upon him, bleeding from head to foot, hardly a shred of clothing left on his body. He was wholly out of his head. At the sight of his rescuers he gave a shrill scream and ran away from them as fast as his weak legs could carry him. Presently he was surrounded, and when at bay fought like a trapped animal. For several days thereafter he remained a maniac, and then gradually became his normal self again.

As another instance of the weird kinks which may take place in a lost person's head, there was a case of a hunter who shot a good-sized bag of birds and then upon starting home found that he was lost. He lost his head, and three days later was rescued by friends. During his wanderings he had gone entirely without food, yet when rescued he still carried the bag of birds which he had shot.

Getting lost in a Canadian wilderness where there may be no habitation for two hundred miles in a given straight line is of course always a more serious matter than being lost in a locality in which a straight line of ten miles in any direction will bring you to a house. But in either case failure to keep a level head, inability to substitute constructive for destructive thinking, may bring the same consequences. It is an ironic fact that many of the tragedies of this nature have occurred in spots which were hardly more than a stone's throw from a settlement.

I do not wish to imply that it is quite the usual thing for a lost person to go out of his head. But I do wish to emphasize the fact that this is always a possibility and sometimes becomes more than a possibility. Just as cool reasoning serves as a curb upon crazy, unwise impulses which come to one in every-day life, so may it down the impulses of panic and terror which assail one who is lost in the woods.

The first impulse of a lost person is action. He wants to run, and if he gives way to this impulse, the faster he runs, the nearer he comes to exhaustion and the greater his terror and bewilderment become. Very likely he runs in circles, but his wits have now become so thoroughly dulled that he does not recognize familiar ground. He is blind to all landmarks.

There is only one safe road of action for a person who suddenly discovers that he is lost. This is to stop in one's tracks, sit down, quietly compose one's thoughts, and think. Review to yourself the general direction which you have taken from your starting-point, the various familiar markings or landmarks along the way, and figure out the approximate time which has elapsed since leaving the last of these. It is quite likely that a few moments of quiet reasoning will show you that you are not half as badly lost as you thought

you were. Retracing your steps a short distance in the direction which seems most logical, you may come to a familiar spot which wholly bridges the temporary gap.

In any case, figure out the most logical line of action, and if this subsequently fails you, sit down and quietly work out another. Climb a high tree or a ridge and scan the section for familiar landmarks. If you have acquired a workable mental map of the locality, this will now come in very handy. You may spot in the distance a river, and there comes comfort in the thought that in following down almost any fair-sized stream one will eventually come to a settlement.

Possibly you have lost your bearings by stepping off a trail for a few moments in order to go in for a little temporary exploration at one side. After turning back toward the familiar trail it may slowly dawn upon you that you are an uncommonly long time in reaching it, and you suddenly realize that you are lost. Sit down and reason the thing out. In both leaving and returning to the trail your direction has been right, because the compass has said so. But maybe the compass lies. This is very unlikely, and common sense comes to the rescue and lays low that particular hope of the demon panic.

You scrape your wits for a possible solution to the problem. Then it occurs to you that a trail viewed lengthwise looks very different from a trail viewed broadside. In fact, when approaching a trail from the side one may almost set foot on it and not see it at all. So perhaps you have crossed the trail without being aware of the fact. You turn back and try out this possibility. And the chances are that you presently set foot safely on the familiar trail.

It is usually foolhardy when lost to make any attempts to travel at night. There is no great hardship about sleeping in the woods overnight. Provided the mind is functioning properly, this can be a wholly delightful experience. If a person sees no immediate chance of reaching known surroundings and darkness is approaching, he should pick out a comfortable spot for a bed, gather pine boughs, keep a fire going if this is necessary, and wait for morning. Then, refreshed, he can tackle his problems with new zest.

Shortly after sunrise the horizon will probably look a lot different to him from what it did the day before, and, guided by his compass, he is presently making a bee line for a recognized landmark. If he has been foolish enough not to bring a compass, a fairly effective prevention against walking in circles will be found in concentrating upon three trees ahead which are in direct line, walking up to these, and then selecting three more, and so on as one proceeds. But, most important of all, if at any time one feels rumbling within him the little blue devils of terror, he should immediately stop in his tracks, rest, and think about something different.

RADIO AND THE NAVIGATOR

BY LIEUTENANT CLIFFORD ALBION TINKER

SHADES of Father Neptune!

What are we going to do with our superannuated navigators? Radio is putting them out of business. For in a comparatively short time the navigator who boards his ship carefully carrying a mahogany-incased sextant and with a "Bowditch" tucked under his arm will be as out of date and as comical as the old straw-chewing rube of the vaudeville stage, ambling along the canyons of New York, carrying his ancient carpetbag and green umbrella.

No more tricky "sun shooting;" no more fog "worries;" no more trailing the log; no more heaving the lead; no more shouting "By the mark TEN!" and no more logarithmic "busts"—"King Radio" has put the "see" in sea.

The gentlemanly navigator of tomorrow is a radio engineer. He sits at a mahogany table in a comfortable office on his modern ship, smoking fat cigars, pressing neat pearl-topped buttons, and letting "King Radio" do the rest. One button tells the depth of water under the keel; another, the distance and direction to the nearest ship, and of all ships within a radius of twenty-five miles; a series of buttons reveals the nearest land, the distance to it, the course to reach it, and fixes the ship's position on the surface of old ocean. All these fancy navigational "stunts" are easily explained—the apparatus which does the business is now in daily use, and is functioning accurately.

All of these developments are epoch-making in their application to ocean commerce, and they are the result of research conducted by the United States Navy in finding the answers to tactical maneuvers and the safe navigation of the taxpayers' battleships and special naval craft. But, as wonderful as these accomplishments all seem to be, they are entirely overshadowed by the new naval development whereby one ship may be controlled by radio waves from another.

The controlled ship is sent hither and yon at the will of the sender without a single soul being on board the ship thus controlled. This may not be the last word in the tactical use of radio equipment in a fleet. If it is not, the next word will be a marvel indeed.

This business of controlling ships by radio is stealing the thunder from the Greek Jules Verne who wrote the story of Jason and the Argonauts, although that ancient yarn certainly came very close to the actual facts concerning the performance of present-day radio apparatus and equipment. It will be remembered that those who built Jason's ship, the Argo, used a branch of the Talking Oak of Dodona for the carved figurehead of the vessel, and from time to time, when overwhelming dangers menaced the craft and crew, the figurehead, which retained its power of speech, gave warning and directions to the leader, Jason, and his heroic mates. Other remarkable divine attributes are imputed to Jason and the forty-nine Argonauts who followed the hero in his quest of the Golden Fleece.

The whole crew were the leading heroes of Greece: Hercules, the strong man of his day; Castor and Pollux, the brave twins; Lynceus, who could see with his sharp eyes to the center of the earth or note the coming storm days before its arrival; Orpheus, the harper, whose sweet notes melted rocks and stilled the wildest waves; beautiful Atalanta, who stepped so lightly that she could walk from wave to wave; the two sons of the North Wind, who came in mighty handy on calm days; while the helmsman was none other than Tiphys, the star gazer, who knew all about the points of the compass. With this crew is it any wonder that Jason brought back the Fleece? The Argonauts feared nothing, because some one in the crew was able to see the dangers in advance; another by breathing lustily

could dispel clouds; the wonderful Argo was a charmed ship herself; and should the crew lose their bearings in spite of Tiphys, the helmsman, it made no difference to Jason, for the Talking Figurehead at once set him right.

This fairy story is not so much of a wonder, after all; for the Argonauts, notwithstanding that most of them were deities, have been put in the shade by the performances of radio apparatus in the hands of mere boys.

The noise of a ship's propellers conducted by the excellent medium, water, to the bottom of the ocean and then reflected back as an "echo" is read by the intervening angle through the hydrophone or radio sounding device, and the depth of the water under the ship's keel obtained. The same listening device also picks up radio waves emanating from submarine cables and follows them into port, notwithstanding the darkness of night or storm. This listening device also notes the range and proximity of sounding submarine signals, of the tell-tale propellers of other ships, of the booming seas against the treacherous iceberg, and picks her own course safely among the ocean's dangers for the ship thus equipped.

With the radio telephone the skipper can talk with his neighboring shipmasters; give and take the latest maritime gossip; compare weather reports; correct locations; and, further, he may also telephone several days ahead to the port of entry, making arrangements for passenger and cargo transfer and request needed supplies, all of which reduces port congestion and saves time, adding meanwhile to the dividends to be earned. These all-important performances of radio mechanisms are not of the future; they are being used daily, and with increasing accuracy, and while many of the activities are war-time developments, used for combating or dodging the enemy, they are no less impor-

Official U. S. Navy Photograph

AERIAL PHOTOGRAPH OF THE RADIO-CONTROLLED BATTLESHIP IOWA

The ship is here shown steaming along without a soul on board, all her movements being directed from the battleship Ohio, twelve miles away

tant for peace-time employment. This is true in the case of the radio direction finder or radio compass. By the use of this apparatus there can be instantaneously located the position from which a wireless message is sent.

As a means of defense against the German undersea boats operating along our coast, the first Navy radio compass station was built near the Cape May Naval Air Station and put in commission on September 1, 1918. The enemy submarines, by working in pairs and using their radio for obtaining bearings, could run down their prey with ease. Their calls furnished the only means of detecting their whereabouts, and it was determined to beat them at their own game; hence the radio compass system. The use of the radio compass is now general, and enables ships to continue under speed during fogs and storms and conducts them safely to port without delay, reducing demurrage charges, and thus saving millions of dollars to shipping. The radio compass system along our coasts is maintained and operated by the Navy free to all nations.

From the foregoing it is not a great stretch of the imagination to realize that the marvels enumerated in the story of the Argonauts have been exceeded by radio devices, and that a new chapter has been written in the navigation of the Seven Seas.

But by far the greatest marvel in this age of electrical marvels is the radio control of ships. Thanks to the brilliant inventive mind of John Hays Hammond, Jr., and the research of the Bureau of Engineering of our Navy in co-operation with the great electrical manufacturing companies of the country, this far-reaching advance in maritime practice has been brought to perfection.

Some time prior to the Great War Mr.

Hammond sent out a small boat from Marblehead, Massachusetts, and operated it, without any one on board, for long distances through Massachusetts Bay, the control apparatus being located on shore. From this first successful experiment came the spectacular operation of the radio-controlled battleship Iowa. The old Iowa, under the control of a distant ship and without a soul on board, has been maneuvered for hours out of sight below the horizon and then brought back to the starting-point. She is the forerunner of huge fleets of radio-controlled naval vessels and, in all probability, commercial ships, which will be directed in battle or in peaceful pursuits to great military and economic advantage.

In describing the apparatus and radio operation of the Iowa it is obvious that some details must be neglected for military reasons, because radio control as mastered by our Navy places us at a great advantage over all other navies, and military secrets must be kept. In order to use the Iowa under radio control it was necessary to fit her out with special apparatus. Some extensive changes were made in her power plant to enable the propelling machinery to be capable of running for a considerable time without attention. The boilers were changed to burn fuel oil instead of coal, and automatic devices for feeding the fuel to the burners and supplying water to the boilers were provided.

The apparatus for controlling the ship consists of a standard radio transmitter on board the controlling ship, a receiving aerial on the Iowa with special radio receivers, amplifiers, relays, and special apparatus for converting the radio signals into such form that they can operate the electrical devices controlling the steering gear and the throttles of the

main engines. The officer in charge of sending out the radio signals from the control ship has absolute control of the starting of the Iowa, steering her in any direction and stopping her when desired.

The various operations which take place are as follows: When everything is ready on board the Iowa, the main engine is started up and left running very slowly. The ship is then abandoned, and the officer aboard the controlling ship takes complete control of the Iowa. The radio signals are sent out from the controlling ship, intercepted by the aerial on the Iowa, and received by the radio receiver located well below the decks. These signals are then amplified by means of special vacuum-tube amplifiers and are made to operate a very sensitive relay, or switch, which in turn operates a larger relay. This large relay closes the electrical circuit which operates an electrically controlled pneumatic valve, and when this valve opens it admits compressed air to the throttle control of the main engines, which causes the throttle to open and bring the ship up to the desired speed. This large relay also operates a device called a commutator, which is a special switch having control of the steering mechanism.

The steering gear consists of a standard steam-engine-driven rudder gear, the throttle valve of the engine being geared to a small electric motor. The commutator is connected to the control panel of this motor, and is thus able to operate a larger electric motor, which in turn causes the steam-engine to drive the rudder to either starboard or port as desired.

A very novel feature of this installation is the automatic steering of the ship, which is made possible with the aid of a gyro-compass. The compass is electrically connected to the control panel of the electric motor on the steering gear, so that the ship can be made to hold any course; the gyro-compass immediately operates the steering gear to return the ship to her course, thus correcting any deviation. The officer sending the control signals can steer the Iowa to either starboard or port or may put the gyro-compass in control and hold a steady course.

The commutator might be considered the mechanical brains of the Iowa; it receives the radio signals and interprets them, passing them on directly to the electric motor controlling the steering engine if the order is either starboard or port, or giving the gyro-compass control if that is the order.

If the officer in control desires to stop the Iowa, he sends a long signal of about ten seconds' duration. This operates a special relay, which opens the circuit on an electrically controlled pneumatic valve, shutting off the various fuel-oil and feed-water pumps, thus shutting down the power plant and stopping the ship.

A special safety device is provided in the form of a time clock, which automatically shuts down everything in case

the radio receiving apparatus becomes inoperative, or in case no control signals are received after a certain lapse of time.

While the description of this apparatus may seem somewhat complicated, in reality the apparatus itself is no more complicated than the central electrical controlling apparatus for the huge gate locks of the Panama Canal, and certainly no more complicated than the wonderful machines which take great rolls of paper and print, cut, and fold several editions of a metropolitan newspaper each day. As a matter of fact, an officer on a controlling ship merely sends out ordinary radio waves, which are received on the Iowa in exactly the same manner as radio waves from a radio telegraph, and they in turn operate special machinery on that ship, causing her to maneuver as if in charge of a crew.

The ship may be sent out and controlled day and night as long as her fuel lasts, and may never be in sight of the control ship during all that time, yet her course can be plotted by the usual methods and her exact position determined any instant and as often as desired.

Think what this radio-control scheme means in the reduction of naval personnel when desperate and hazardous projects are a necessity, and how it will minimize the casualties of an engagement. This last feature will pay for all the equipment our factories can produce from now till doomsday, for, after all, it is the men who make a navy; the ships are their tools, and, be the tools ever so marvelous, without trained men to handle them they are impotent as fighting machines, and, in fact, so much junk.

This great field of radio propelling and movement control is now engaging the best thought on the part of the world's most advanced scientists. In our own Navy the future employment of radio control will embrace the operation of torpedoes, both water and aerial; ship

and fleet movements; gun fire; airplane and seaplane flights; mine explosions; enemy-ship dispersion by interference; nullifying enemy radio-control operation by excessive wave-length discharges up and down the scale; and barrage operations involving the use of fire rafts, dynamite ships, mine-sweeping craft, and whole shoals of torpedoes. Some of these developments have been practically completed, others are under way, and it is not too much to say that the next five years will see them all successfully in operation.

Perhaps the most important use of radio control will be in connection with aircraft development. Airplanes have already been so controlled. Fokker, the nimble-minded Dutch inventor employed by Germany during the World War,

brought out a plane which responded to radio control and could be maneuvered up to distances of twelve miles from the control apparatus. He would have sent such planes in formidable numbers over France loaded with radio-releasing bombs had the armistice not stopped him.

Huge rigid airships, serving as mother ships for airplanes and flying-boats, will be able to use radio control to immense advantage. Being long-distance craft, the rigid will carry its complement of planes to distant scenes of action, release them, and, by radio control, carry out search and protective scouting herself while bombing and torpedoing with her planes.

All classes of aircraft will be utilized for the radio control of barrages of torpedoes against enemy fleets. This in itself is not only a terrible weapon, but it will make for economy of operation and conserve the lives of trained aviators, and the training of this class of fighter is a long process and requires exceptionally high-grade personnel. It will also reduce the number of destroyers and submarines which would be necessary under the old methods of attack, releasing such vessels for defensive fighting along our extended coast-lines and for other operations with the fleet.

These statements are not idle dreams, by any manner of means, but are indicative of the problems now being worked out by our navy engineers and the manufacturing establishments co-operating with them. Our primary endeavors along these lines have been successful, and there is no reason to suppose that the new projects outlined will not be brought to the same successful conclusion. Those in charge of our present naval development, and who are planning and working for the future, may be trusted to exceed our expectations even, for no country on earth commands better brains than ours, and as for loyalty, we have it in the highest measure.

CHARACTER TYPES OF CHILDREN

A NEW ANALYSIS

BY CHARLES K. TAYLOR

MANY years ago, more than a couple of thousand, a clever Greek with a sense of humor wrote a perfectly preposterous plan for analyzing character from appearances. Some attribute the paper to Aristotle,¹ but one cannot imagine that serious philosopher using such broad humor to poke fun at what must even then have been a well-known "system." Two of the mocking classifications are as follows:

"The small-minded have small limbs and small, delicate lean bodies, small eyes and small faces—just like a Corinthian."

"Men addicted to gaming and dancing have short arms, like weasels."

And the theory he poked fun at still has its followers and its exponents, many of the latter doing very well, having large followings and believing their theories themselves. So we hear now and then, in magazine articles and in impressivé books, that if we do but notice the shapes of foreheads, noses, chins, and heads, and the color of the hair, and the texture of the skin—why, all we have then to do is to add up the various characteristics those things indicate and the character analysis of that individual is complete and unassailable.

After all, this is a most attractive kind of "system." It is so simple, and the reasons seem so plausible, and such brilliant examples are found of folk who seem to show the requisite characteristics to match their physical entities. Only there seems to be a flaw somewhere if you happen to think of the significance of the theory that would make it possible to tell character from fixed physical characteristics.

A little time ago an exponent of this type of analysis was telling a group of interested folk how infallible it was—how the shapes and textures and sizes inevitably proclaimed the character of the man. One hearer then described the workings of a certain "rescue mission," and asked the lecturer if this kind of work were worth while. "Certainly," declared the lecturer, and then described a remarkable case, wherein a regular down-and-out worthless tramp turned over into an aggressive and successful man, a wholly different kind of man. Then the listener had that lecturer.

"Yes," said the listener, "and when that man's character changed his profile changed too, didn't it?" There was a ghastly silence and an irrepressible laugh. The hit was palpable. If character can be told by fixed physical characteristics, like shapes of features, colors, and textures, then character is itself fixed, and cannot change. But if character can change, if whole charac-

teristics by training and environment can be made to change—as we all know they can—then you cannot possibly tell characteristics or character by means of any fixed physical qualities.

Now of course this is not applying to abnormal humans who are malformed, or unformed, in any way that goes with mental under-development or the like. The phenomenally small skull, for instance, generally goes with a poor or worse mental development. But even this is not invariably the case. The writer knows one very brilliant man with a skull fully three inches below the average in circumference. But, in general, an abnormally small skull of this kind would be significant. But we are not discussing abnormal folk. We are talking about every-day responsible humans. Let us make ourselves sure that you will not be able to tell much that is reliable about the individual's character from the fixed physical characteristics—which is a very different thing from recognizing characteristics from the expression of the face. The expression can change immensely, and from this you can tell much, because it reflects the individual within very beautifully, though not invariably.

Well, if you cannot diagnose a character by shapes and sizes of chins, noses, foreheads, and so on, is there any other way of attacking this important problem? For it is important. It would mean much if a teacher had some way of telling the general character type of a child, and suited the training and care of that child to the type.

It seems that there is one element that can be used in such a diagnosis—particularly of a child. And this is "behavior." We all know that different children act differently under the same circumstances. We know that some are quiet, some are noisy, some are apathetic, and so on. Suppose by noticing how a child behaves a teacher or parent could make fairly sure character-judgments. Such a system would be at least reasonable, for one's personality is likely to betray itself by the way it acts under various circumstances. And this would include all kinds of behavior, from self-control to the behavior of the mind under intelligence tests.

The writer for some years observed numbers of children, in class-room, on playground, in camp, and elsewhere, in an effort to see if there were certain kinds of general behavior under which children could be grouped. This, eventually, seemed very possible.

For instance, there were children who were quite active, both in class-room and playground. Their attention in class was alert and businesslike; on the playground they were similarly active and

alert, as well as purposeful. They seemed to have a good control over their activity. This was a fine type. The boys and girls standing near the top of the class were almost always of this type. And, come to think of it, most successful folk of our acquaintance seem to be of this type. What shall we call it? Perhaps the "active-controlled" will be as good a name as any. Does not this at once bring certain people to your mind? Or certain children? Do you not recognize it as a very definite type of character, and one almost unmistakably indicated by "behavior"? Let us call this our first general type, then, the one with the active mind and body well controlled—in other words, the "active-controlled."

There was another large group of children that at first was confused with the one already described. These children were active enough, in all conscience, both in class-room and out of it. But after a while, after a close study of many individuals, a difference began to appear. They were active, mentally and physically, but they did not seem to have a good control over their activity. They were likely to start many things without finishing. They were not steady. Some were full of good-natured mischief, playing pranks both where pranks were appropriate and distinctly where they were not. These were the so-called "harum-scarum" folk—heedless, noisy, good-natured, and seemingly unable to concentrate unless their interest were aroused to a very unusual degree. And there were others who were not so good-natured, who played malicious tricks, whose class-room disorders did not come from thoughtlessness, but purposefully. These, then, make up another kind of active group—a group not having a good control of their activity. Perhaps we could call them the "active-uncontrolled."

And, finally, there was another marked group, not nearly so large as the other two, but conspicuous enough because so different. These children did not seem to take much interest in anything. They were inclined to be stolid, unemotional, too quiet, vacant-minded, and, in brief, apathetic. Do you not know individuals of this very type? Just as with individuals of the two previously described types, once you think of the types they stand out clearly enough.

So here we had a beginning—three rather distinct kinds of behavior, with various intermediate stages, of course. No, you couldn't tell by the shape of a boy's chin or of a girl's nose what type he or she belonged to. You could tell by the manner in which the child behaved under various circumstances. After all, it seems as though it might be a rather fair method for judging

Composite of portraits of 16 boys of low-grade mentality. Note slackness of mouth and smallness of head, as compared with Nos. 3 and 4. They were mostly "apathetic"

2
Composite of portraits of 16 "incorrigibles." Mostly "active-uncontrolled" and of poor mentality. The head is larger than in No. 1

3
Composite of portraits of 16 of the "brightest" boys in a large grammar school in a foreign quarter of an Eastern city

4
Composite of portraits of 16 of the brightest boys in a private academy and a public school predominately Anglo-Saxon. Note, with 2 and 3, the broad head and firmness of expression, as well as the intelligent look

COMPOSITE PHOTOGRAPHS

Expression means much. But fixed physical characteristics are sometimes unreliable. For instance, in the above we have the characteristic small head of the low-grade mentality contrasted with the broad forehead and larger head of the intelligent type. Yet the small head does not necessarily indicate low intelligence, though it does in a majority of cases. It is thus an important "indication" that must be added to others for a fair judgment. Such a matter as cranial capacity, however, is a different matter, for instance, than a profile curve, because the cranial capacity bears a direct relation to the size of the brain, which in turn bears a direct relation to intelligence

character—by noticing how a personality expresses itself through action.

Well, this is but a step. Let us see if we cannot go further.

The "active-controlled" make up what is obviously the most desirable type. It is the type that furnishes leaders. It supplies those who do the work of the world, the physical largely, as well as the mental. Is it not desirable, therefore, to bring into this group as many as possible from the other two groups? Let us study the two less desirable groups a few minutes. Quite a large number of the "active-uncontrolled" were studied, physically and mentally. And perhaps almost half had a physical irritation of some kind that was driving them continuously. Sometimes it was bad teeth, impacted or decayed. Sometimes the unspeakable adenoid was doing its abominable work. Sometimes it was eye-strain—and this was no infrequent cause either—or it might have been a spinal curvature or fallen arches. It took quite a thorough examination, sometimes, to find where the trouble lay. So the "active-uncontrolled" could be subdivided into two groups—the healthy and the unhealthy. In general, too, the unhealthy ones were the less desirable of the two. Their mischief was more likely to be of the malicious kind. They were the more purposely rebellious and disagreeable—which is not to be wondered at! They had a mighty good cause to be acting as they did—and of course were quite unaware of the cause.

So you can see that it is very much worth while if you can tell when a boy or a girl belongs to the "active-uncon-

trolled" group, if such observation only moves you to have the child given a thorough medical examination, to see if there is not some remediable physical cause behind the irritability and lack of control.

But suppose you cannot find any physical ill or defect. Suppose the child seems to be in the pink of health, and yet obviously belongs to the "uncontrolled" group. Well, looking up quite a number of this kind, it appeared that there was something lacking in their environment and training. Perhaps they lived in poor districts and were neglected by their parents, who rarely saw them and who paid no attention to their characters, letting them follow their own desires and impulses without much restraint. Or sometimes they came from very wealthy homes, where they were neglected by their parents, who rarely saw them and who paid no attention to their characters, letting them follow their own desires and impulses without restraint! In fact, about the worst types the writer has known have come from families of this latter sort—from highly "Social" folk, spelled with a capital "S," who were far too busy with the inconsequential to have much to do with the character development of their children, and who let this rather important matter, when it was thought of at all, be handed over to the tender mercies of not too careful servants of various sorts.

When such a child comes from a home of the poorer sort, there is a hope that something can be done, for these folk generally wish to do the best for their

children and welcome suggestion and aid. But with too many folk of social aspirations one cannot arouse the least interest. And when it is pointed out that Tommy has become badly spoiled, that he has gained willfulness instead of will power, that his character has become weak from easy indulgence, that his artificial summer life in hotels and resorts, and equally artificial winter life, with its preposterous pseudo-adult dancing affairs and so on, have combined to destroy any worth-while characteristics he may have inherited, the supercilious parents are likely to look bored. They may even remark that, after all, it didn't make a lot of difference—for it would all be knocked out of them when they got to St. Somebody-or-other's, where they were entered when they were born! There are few things that actually get on the nerves of thoughtful teachers as does the careless weakening of the possibilities of children of first-class inherited capacity, and our schools are full of them. And you could do wonders with those children, too, if by some merciful but quick means you could get rid of the parents.

So we have a healthy kind of "uncontrolled" child, whose problem concerns environment and training, and when you can gain the sympathetic understanding and co-operation of the parents wonders can often be worked with children of this type. For the "active" quality is a fine asset if it is directed along worth-while lines!

And here is the summary of this second group:

The "active-uncontrolled," who may be

TRANSFORMATION OF

MORE AGGRESSIVE
EXPRESSION

healthy or unhealthy. If the former, then you have a problem in environment and training to solve, and if the latter you have the medical examination and proper care to provide for. And when children of this type are treated as they should be, very frequently it is not at all difficult to make it possible for them to change gradually into the "active-controlled" type, to their and to society's great advantage.

This brings us to the third general group—the "apathetic." Now this is not by any means the first time that observers have noticed that some individuals are "apathetic" and others are "active," and the like. In fact, some, like Pauline Malapert, in "*Les Éléments Caractère*," have made very interesting lists of character types, such as "*Les apathiques, les affectifs, les intellectuels, les tempérés, les volontaires*," and so on, with their various subdivisions. What we are trying to do here is to single out types of behavior very obvious to an observer and to study their significance in some practical way, with the benefit of the child in view.

The "apathetic" do not need long description. They are the listless or the stolid ones, the continuously "lazy" ones, those who seem physically and mentally inert, unemotional, and unexcitable, and so on. They present different characteristics, but are easily distinguishable as belonging to the general class of apathetics.

Now all this does no good unless we recognize what being in such a class signifies. Many of these children were studied, with a result not unlike that following a study of the "uncontrolled." That is, some were healthy, and others

were unhealthy. The unhealthy ones sometimes had some digestive trouble, or perhaps there was heart or circulatory defect of some kind, or one of other possible causes. And in most cases they were of a remediable variety. This brings us to the same procedure found desirable for the "uncontrolled" child—a medical examination first of all, and when physical conditions are found that might well be at the bottom of the child's lack of energy, then obviously the thing to do is to remove them as rapidly and as soon as possible.

The writer has in his possession a photograph of an "apathetic" type of boy found to have bad tonsils, large adenoids, and a seriously under-developed chest. That boy was not getting enough oxygen to enable him to do much thinking, let alone running around like other boys. The examination showing these defects, the adenoids and tonsils were removed at once. He was given special daily exercises to improve his breathing capacity. His diet was carefully supervised and he was encouraged to take more and more interest in out-of-door play. A few months made all the difference in the world. The boy went into the "active" group, with a wholly different attitude toward life and, as might have been expected, with much firmer lines of expression on his face. For a slackness of facial muscle seems to go with the weak and unintelligent type, and the firm lines and firm lips with the stronger and more intelligent individual. So much for the "apathetic-unhealthy" kind of child.

When the "apathetic" child was found to be healthy, an intelligence test was frequently illuminating. Now it is true

that you find some who are physically most inert and who have very active minds—just as there seem to be exceptions to all rules. And the last thing we are suggesting is a hard and fast rule, anyway. But, generally speaking, the active mind and body go together. The writer has found a very high coefficient of correlation between mental and physical activity.

Coming back to our healthy "apathetic" child. In general, the child made a second-rate intelligence test, and very often a downright poor one. So that with the "apathetic-healthy" you frequently have a question of mental training to deal with, and too often a very serious one.

And that completes a bare outline of the prominent types of behavior—physical behavior, we might call it. It would be interesting to take up forms of mental behavior, with a discussion of the significance of the modern intelligence tests in their various forms. And these tests are of much greater value than one would always admit, not only as an aid in classifying children, but in finding weak points that can be improved by special training. This is a fascinating field, and one hard to keep away from. But I am not writing a book on child analysis. I started out to give a bare outline of several common types of behavior and what they signify. Possibly their recognition, followed by proper training, may solve some of our worst class-room difficulties—not to speak of the greater individual efficiency and happiness coming to those who free themselves from those character handicaps that so often mean unsuccess, failure, and social disgrace.

A GARDEN WITHOUT LINEAGE

BY E. K. PARKINSON

THE outline, shading, and harmony in the established permanent garden which has been tended and cared for season after season naturally produce most satisfactory effects and show the well-grown plants which careful culture yields. But what about the floriculture in the garden merely hired for a few months in the hot season and those few sickly flowers struggling for a bare existence in beds choked with weeds? It is here that the important fact is too often lost sight of that there are plenty of blossoms and vines to be had for very little, which will greatly increase the beauty of the rented garden, and which may be planted after the first of June with signal effect. The reason too often assigned for the neglect of these small spaces reminds one of the old Scotchwoman who, when asked by her dominie if she had understood the sermon, replied: "Indeed, wad I hae the presumption?" In fact, most people going to the country for only a few months in summer deem they know far too little about gardening of any kind to attempt in the remotest degree the slightest beautifying of the bare space about the house, and will tell you with a shrug of the shoulders: "Oh, I'm no professional; the garden will have to take care of itself."

But how can any one be content without at least a few flowers in the country, the securing of which involves so little labor and less expense? Take nasturtiums, for instance, which during the last few years are to be had in many of the most lovely shades of rose-pink and cream, and will grow in almost any soil. The double forms are particularly charming for borders and beds, while the innumerable climbing kinds can be made to hide many an ugly fence or wall and cover a stiff and ungainly bit of piazza to great advantage. Then there is the dwarf candytuft, which is a good plant for edging, and may be planted late and sown thinly. There is also the mignonette and marigold, both of which may be sown appropriately in June; the former should be planted in series of a few days apart, as it is short-lived, and so will last longer. The French marigolds will produce blooms in plenty if they are

accorded all the sun they crave, and are most decorative and effective during the later summer season. Next, no one should fail to add some of the brilliant salvia to his garden, not only for its brilliancy, but because it is long-lived as well, and when many of the other blossoms are gone the accommodating salvia is still there glorious as ever. The old-fashioned phlox is always admirable, with its many-toned blossoms in an effective range of colors, and where masses of particular kinds are planted in June there will be a charming flower-patch to draw from quite late in the season. If the rented house is to be occupied during the early autumn, the occupant should be sure to set out some of the newer varieties of the beautiful asters; there are many kinds from which to choose, and although there will always exist a diversity of opinion regarding the merits of certain plants, at least the aster may be said to be exempt from adverse criticism, so exquisite are its colors, so charming its effects.

How few people are familiar with the tuberous begonias! And where the hot-house begonia would only partially supply a deficiency of the kind we are discussing, the tuberous variety will make a rapidly maturing, sturdy plant, easy to grow, and with large waxlike blossoms in all the handsome shades of yellow, pink, scarlet, and creamy white. These plants need plenty of water, and do admirably in the shadier parts of the garden, but should be planted in well-raked-over, rich soil. Next, those who are familiar only with the more common forms of geraniums, namely, those varying from the most intense brick-red to the dingy yellow-red, can have no conception of the beauty of those blossoms in their rarer and perfected state. Where carefully chosen as to color and well grown, the newer form of geranium is distinctly decorative and in the shading of its cool green leaves possesses some of the suppleness and charm of the wild-wood flowers. Let the man with the rented garden try, for instance, the lovely salmon-pink variety known as the Beauté Poitevine, or the soft white Mme. Recamier, combined with the S. A. Nutt, which is a deep shade of crimson, or the famous

Marquise de Castellane in two shades of red, all of which are excellent and will prove a great comfort to those who are obliged to plant a late garden.

No one should neglect the many forms of Iceland poppy to be had of late years; or the California poppy, which is a better-known variety, with brilliant blossoms, and makes a gay showing when planted in large masses to cover ugly bare spots in the hired garden. But the Iceland poppy is the more beautiful of the two, and its foliage more delicate; it is also less fugacious than most of the poppy family, there being always a fresh blossom to supply the one which has just gone by. Of course all the poppy tribe revel in sunshine, and it will be found they thrive best in a sandy soil. Occasionally among the seedlings a semi-double form will occur as well as a charming dwarf form, often white or yellow with short stiff stems, sometimes bearing ten or fifteen flower-cups within quite a small diameter. The Alpine poppy, on the other hand, does better in damper soil and is by no means so pretty or so floriferous as its near relative the Iceland poppy.

What shall be planted, however, will depend a great deal upon the size of the space to be filled, how long the rented house is to be occupied, and various other necessary considerations. But experience will teach better what to leave unplanted than two or three volumes of instruction; but at least aim at individuality and an artistic whole and avoid coarse weedy subjects, and as a rule plants that throw out strong creeping rootstalks will be found objectionable. Another point to remember is not to plant your flower-bed in stiff rows, as though it were supposedly on a military review; variety is always the spice of a garden, and, where too much space is not called for, massing is often very desirable with medium-sized plants. The skilled decorator, with a sharp eye to effects, will also arrange his garden (for however short a term it may be actually his) with reference to the effect from the interior of the house, so that the lovely flower space may be rendered beautiful from inside out, as well as from outside in.

THE BOOK TABLE

THIS PREDIGESTING BUSINESS

BY FRANCES DUNCAN

THE way to form in children a taste for good literature is to see to it that they have good literature to taste. "Tell me what you eat and I will tell you what you are," runs the slogan of a well-known health food. Shakespeare had the same idea of the value of diet, though he didn't make a slogan of it—"Upon what meat doth this our Cæsar feed, that he hath grown so great?"

Look back, sir, or madam, to your own childhood. What books made an impression on you? Or, rather, what were the books that you absorbed and from which you drew sustenance? They were real books—not predigested infant's food. The worst of this predigesting business, this rewriting for children, is that in the process of serving up the work of a great writer through the medium of a little writer the wine, however good originally, tastes of the bottle and the cork; the process is devitalizing.

I experienced the other day a feeling of genuine shock when I looked at a leaflet my little children (of three, five, and six years) brought home with them from Sunday school. The lesson was from Isaiah—the original passage is familiar and beautiful:

In the year that King Uzziah died I saw also the Lord sitting upon a throne, high and lifted up, and his train filled the temple.

Above it stood the seraphim: each one had six wings; with twain he covered his face, and with twain he covered his feet, and with twain he did fly.

And one cried unto another, and said, Holy, holy, holy, is the Lord of hosts; the whole earth is full of his glory.

And the posts of the door moved at the voice of him that cried, and the house was filled with smoke.

Then said I, Woe is me! for I am undone; because I am a man of unclean lips, and I dwell in the midst of a people of unclean lips: for mine eyes have seen the King, the Lord of hosts.

Then flew one of the seraphim unto me, having a live coal in his hand, which he had taken with the tongs from off the altar.

And he laid it upon my mouth, and said, Lo, this hath touched thy lips; and thine iniquity is taken away, and thy sin purged.

Also I heard the voice of the Lord, saying, Whom shall I send, and who will go for us? Then said I, Here am I; send me.

But this is what I read in the leaflet:

Isaiah, the prophet, often went into the temple to pray.

In a vision, in the temple, Isaiah

saw the Lord sitting up on his high throne.

Shining angels stood on each side of the throne of God.

They sang to one another, saying, "The Lord is holy."

The doorposts trembled with the sound of their voices.

Isaiah was troubled when he saw the Lord, for he felt that his own heart was full of sin.

One of the angels told Isaiah that his sins were now taken away.

Isaiah heard the Lord ask whom he should send to preach to his people.

Isaiah said, Here am I; send me.

How pallid is the leaflet rendering beside the original's force and power! And why on earth did the good lady think it necessary? Had she so little belief in Holy Scripture that she was unwilling to trust the babes with the vision of Isaiah and its striking imagery? And the worst of such rendering—or rendering—is that it defeats its purpose. The child doesn't remember it so well. Why should he? It isn't so memorable.

So with the Easter lesson—the beautiful incident of Christ's appearance to the disciples in the upper room and his words to Thomas (surely simple enough for any child's comprehension) were altered. "Reach hither thy finger, and behold my hands; and reach hither thy hand, and thrust it into my side: and be not faithless, but believing." Instead we have: "Christ told Thomas to put his finger into the print of the nails," etc.

The change is the change from a picture into a plain statement of fact. And in most of the stories from the Bible done for children the change is always this, from the dramatic to the easier narrative form. And the stories lose immeasurably! So do the children.

Our English Bible in the King James's version is very beautiful, very noble. Not only that, it is deeply inwrought into our English literature. Delete the Bible allusions and references from the work of Milton, Browning, Tennyson, Herbert, Donne—of prose writers from Sir Thomas Browne to Ruskin—and envisage the irreparable gaps! A thorough knowledge of the Bible has been an integral part of the training of the men and women who, in the past, have counted for something. How often do we find the "Bible and Shakespeare" serving as the strong roots from which many a fair tree of scholarship has up-reared itself!

Why should we defraud our children of this rich inheritance?

And the time of all others for gaining a familiarity with the English Bible is in very early childhood.

It is well enough that they know the story, the gist of the narrative, but what is gained by not giving them the text? And how much admirable grounding in our English speech is lost!

Those of us who were fortunate enough to have had a childhood wherein the daily reading of the Bible aloud was an integral part of the home life, coming as certainly as breakfast (and in point of time, just after it), would be most unwilling to give up the memory or to give up the familiarity with the stately procession of Old Testament folk that passed before the childish horizon, vivid as the "Arabian Nights," and more closely related. It was Old Testament chiefly, as I remember it, because we youngsters liked it, with the Psalms (which our parents liked) interspersed on days when one of us little folk happened to miss the reading. And to miss "what happened next" was a real distress! Yet, though at that time we didn't especially care for the Psalms, they were firmly fixed in the memory in all their beauty and poetry.

There is nothing in the King James's text that presents any great difficulty to childish hearers. Of course there are bits to omit, but any intelligent mother can manage that. And it appeals to children. It is dramatic—intensely dramatic—and children love the dramatic. All the folk tales and fairy tales that are best loved by little folk are dramatic, and written almost in dramatic form. That the child understands every word is quite unimportant. When was complete understanding ever necessary to enjoyment? In fact, the lack of it is to a child an added charm, for at each successive reading he gets a bit more.

Exegesis, explanation, authenticity—all discussion of these can wait until adolescence. I was reading to a three-year-old the story of Shadrach, Meshach, and Abednego, and the fiery furnace. Of course I had to "read it again" and "read it again," and thereafter for weeks tell it as a bedtime story (for the suggestion of warmth, I fancy, for our New Hampshire thermometer stood at 30° below). But was I allowed to omit one instrument from the list—"Cornet, flute, harp, sackbut, psaltery, and dulcimer, and all kinds of musick"? Not one. There was a certain sonorousness in the repetition the little fellow liked.

The committing to memory of passages and chapters and of Psalms even by very little children doesn't hurt a child in the least. He does it easily, often by repeated reading, unconsciously. And many a thing learned unthinkingly in childhood stands by one at a critical time in after life—an "anchor to windward" my sea-captain father used to say.

The lately published "Diary of Opal" throws interesting light on how much a very young child can appreciate of high endeavor. Consider how much solace in

the child's loneliness was hers because of teaching her mother had given her before *sir*! Would a familiarity with Peter Rabbit or the Little Red Hen have given the spiritual sustenance?

One need not emulate Susannah Wesley (mother of John and Charles—and of sixteen children besides), who upon the day that each child attained the age of five years started the little one in at Genesis, without even a primer to break the shock. But John and Charles Wesley were creditable sons. Though we do not go to her extreme, surely it is time to give our children something besides the trivialities with which their minds have been deluged.

The heroic appeals to little children; they love imagery. Even little children are far more susceptible to a high idealism than we think; I believe they need stronger and simpler food than that usually allotted to them. Try them, gentle reader! Daniel and his companions besought the king's eunuch to give them pulse to eat, and their countenances were fairer and fatter than any of their companions who were fed the more highly seasoned diet of "meat from the king's table."

I am not urging that we make children old before their time, but that we give their minds a rest from the eternal drivel that is poured into them and return to what formerly constituted a large part of infant fare, namely, large portions of English poetry and the Bible. Why distress yourself about bedtime stories, dear sir or madam? Leave for the moment Tommy Titmouse and Johnny Woodchuck. Have Grimm and Hans Andersen, Robinson Crusoe—and for the rest dust off your Bible and begin at Genesis.

ROMANCE AND REALITY IN INDIAN LIFE

IN a handsomely printed and well-illustrated quarto volume¹ the editor and her contributors undertake what they tell us is a labor of love. They seek to make American readers who are not ethnologists acquainted with the nature, feeling, and imagination of the American Indian. The plan is a novel one. Here are some dozen or more professional anthropologists, ethnologists, and curators of museums who deliberately choose the medium of romantic relation as the best way of making us understand the Indian.

The reason for this plan is that, while there has been an immense amount written about the Indian, the scientific side (presented largely in dry monographs) has been too dull to get itself read, while the romantic side has shown us good Indians and bad Indians, but hardly ever the true Indian. Since the day

THE AMERICAN INDIAN

A drawing by C. Grant La Farge from "American Indian Life"

when Fenimore Cooper idealized the Indian and was followed by a long list of romantic writers, and the day when the early dime novelist described the "red devils" in a purely diabolical way, and was followed in this by writers of more elaborate and expensive but not more accurate sensational stories of our time, there has been little in the way of fiction that has not misled the general reader in one direction or the other. Thus the American Indian is fast becoming legendary and the actual knowledge about him is confined to the ranks of professional students. This book provides vivid and authentic pictures of experiences, tribal or individual, so that it may be recommended both to those who want to read vivid legends and tales of Indian life and to those who want to get correct views of how the Indians lived in village and camp, how they made love and war, and what their social and religious customs were.

The editor is herself one of the few white Americans who is a member by adoption of an Indian tribe (the Hopis), and she writes with special knowledge of the Zuni. In the same way the contributors write, each of a tribe or group of tribes of which he has special knowledge. It is quite notable how readily

these writers, who are almost all scientific specialists, accommodate themselves to the general plan of telling stories rather than of writing essays.

The planners of the book have been fortunate enough to secure the aid of Mr. C. Grant La Farge in its illustration. The many full-page drawings in black and white and the six full pages in color fit the text and the purpose of the work admirably. They are based on a thorough study of museum collections and show characteristic features of Indian art as well as illustrating the text specifically. One of these pictures we reproduce herewith.

The element of historical information and of scientific ethnology is provided by an extremely readable Introduction and by careful appendices and bibliographies. One interesting comment by the writer of the Introduction, Professor A. L. Kroeber, of the University of California, is the warning he gives the reader that any such effort to depict Indian life by story must be a little out of balance because it leaves the reader impressed with the ritual and ceremonial attitude of the Indians toward religion, while, on the other hand, it almost necessarily leaves out the factor of Indian humor, not because humor

¹American Indian Life. Edited by Elsie Clews Parsons. Illustrations by C. Grant La Farge. B. W. Huebsch, Inc., New York. \$10.

does not exist among the Indians, but because it is so different from ours that the attempt to reproduce it would fall flat. He points out also that the greatest strength of the book is in dealing with the daily life, personal relations, and ambitions of the Indian individuals.

The only parallel to this kind of treatment of Indian life by archaeologists through romance is Dr. Bandelier's novel "The Delight Makers." Professor Kroeber sums up the matter by saying:

The present book, then, is a picture of native American life in much the sense that a series of biographies of one statesman, poet, or common citizen from each country of Europe

would yield a cross-sectional aspect of the civilization of that continent. France and Russia, Serbia and Denmark, would each be represented with its national peculiarities; and yet the blended effect would be that of a super-national culture. So with our Indians. It is through the medium of the intensive and special coloring of each tribal civilization that the common elements of Indian culture are brought out most truthfully, even though somewhat indirectly.

We may cordially congratulate the editor, publishers, and printers in having produced a work of real value, of decided entertainment, and of notable beauty in form and appearance.

THE NEW BOOKS

BIOGRAPHY

LIFE OF DONALD G. MITCHELL (THE). By Waldo H. Dunn. Charles Scribner's Sons, New York. \$4.50.

One is surprised to find that no previous life of Ik Marvel has appeared. But his gentle and cultured personality as shown modestly in his books appeared there clearly and intimately. The present Life will do good service if it directs readers to those books, which have that pleasant charm of good writing and admirable description rare in recent essayists. The Life is excellently done; in it we follow Mr. Mitchell through his Edgewood farm days (this book was partly written in the old farmhouse, now closely hemmed in by New Haven's growth, but with the name fitly preserved in Edgewood Park), in his experiences abroad, and in his comradeship with books and thinkers.

SCIENCE

OUTLINE OF SCIENCE (THE). A Plain Story Simply Told. Vol. I. By Professor J. Arthur Thomson. G. P. Putnam's Sons, New York. \$3.75.

This is the first volume of a popular résumé of scientific knowledge which apparently aims to do in its chosen field what the famous "Outline of History" has done for the more distinctively human aspects of the world's past. The chapters are short, divided into sections and sub-sections for easy reading, well printed in legible type, and copiously illustrated. The point of view is that of a frank acceptance of the evolutionary theory, which is interestingly and convincingly presented. The work, it may be confidently predicted, will have a large sale to "the intelligent student-citizen," for whom it is written, and will do much to introduce accepted modern theories among people (like Mr. Bryan and his sympathizers) to whom these ideas have been unwelcome as controverting traditional views.

POETRY

VEIL (THE). By Walter De La Mare. Henry Holt & Co., New York. \$2.

Alone among that group of not-so-much-younger English poets called the Georgians the work of Walter De La Mare stands as a definite individual expression. The rest of the group write so much alike that it is difficult, without the tag of a name, to tell whether a

poem issuing from this band is by Mr. Squire, Mr. Shanks, or Mr. Turner. They all eat out of one platter. Mr. De La Mare is different. He plays upon a small violoncello and from his bow come tender, wistful, eery strains. A suggestion of the impalpable surrounds his poetry, and the exceeding delicacy with which he handles his themes conveys a fairy-like spirit to the reader.

"The Veil" is quite on a plane with the volumes that have preceded it. Here again are the faltering rhythms, the Blake-like purity of spirit, the faint perfume-like suggestions of unseen figures and rustling forms. All is atmosphere rather than direct utterance. No one but De La Mare could have handled a poem in quite this way:

Isled in the midnight air,
Musked with the dark's faint bloom,
Out into glooming and secret haunts
The flame cries, "Come!"

Lovely in dye and fan,
A-tremble in shimmering grace,
A moth from her winter swoon
Uplifts her face:

Stares from her glamorous eyes;
Wafts her on plumes like mist;
In ecstasy swirls and sways
To her strange tryst.

It should be perceptible that a note a trifle deeper than any shown heretofore by De La Mare is to be found in "The Veil." It is not so much that the poet suffers from a metaphysical unequilibrium as that his spiritual curiosity is creeping beyond fairies, fancies, and twilight-colored things into human fluctuations. With age comes a note that is more analytic and brooding.

FICTION

RED HOUSE MYSTERY (THE). By A. A. Milne. E. P. Dutton & Co., New York. \$2.

A murder and detective story by the author of "Mr. Pim" and "The Dover Road," better written than most crime stories, as might be expected from the authorship. Its peculiarity is that the mystery is, not who committed the murder, but what were the cause and the method of the crime.

OPPIDAN (THE). By Shane Leslie. Charles Scribner's Sons, New York. \$2.50.

The real hero of this story is Eton College, not Peter, the rather colorless

"oppidan" boy whose adventures at Eton are here related. The customs, traditions, and unwritten law of the famous English public school are described with elaborate minuteness. The method is the opposite of Hughes's "Tom Brown at Rugby," and one result is that Eton is much clearer in depiction than was Rugby in that story.

TRUTH ABOUT VIGNOLLES (THE). By Albert Kinross. The Century Company, New York. \$1.90.

There is something fascinating and Kipling-like in these adventures of an old soldier of the Camel Corps who deserts in order to get to the front. The glamour of the East is strong. The author knows just how Egypt and Mesopotamia seemed to the English soldier in the Great War, and flavors his realism (sometimes a bit strong) with imagination and Oriental mystery.

CONTRIBUTORS' GALLERY

JOSEPH DANZIGER even before the war had an established reputation as a popular writer on financial and economic subjects. In 1915, by obtaining an appointment as war correspondent, he was able to get behind the German lines and investigate conditions in Belgium and Germany. Mr. Danziger has published a series of articles on Belgium, which were heartily commended by editors for their fairness and accuracy, and compiled an exhaustive bulletin on the German economic situation.

CLIFFORD A. TINKER is a lieutenant in the United States Navy and a former aide to Admiral Moffett. From Washington, where he is associated with the Bureau of Aeronautics, Lieutenant Tinker sends us an account of the actualities and possibilities of radio control.

HILDA CONKLING is the younger daughter of Mrs. Grace Hazard Conkling, Assistant Professor of English at Smith College, Northampton, Massachusetts. Of Hilda's first book of verse, published in 1919, when she was only nine years old, Miss Amy Lowell wrote: "I know of no other instance in which such really beautiful poetry has been written by a child." Hilda's new book, "Shoes of the Wind," will be published by the F. A. Stokes Company in the autumn.

ELON K. JESSUP and **E. K. PARKINSON**, both lovers of outdoors, treat in this issue of two widely different aspects of nature. One deals with the wildness and ruggedness of the forest; the other, with the peaceful domesticity of the house garden.

FRANCES DUNCAN (Mrs. John Manning) writes us that she is "living on a farm in Cornish, New Hampshire, miles off from anywhere, chiefly occupied with three very lively youngsters." She is well known as a writer on gardening and horticulture, and is the author of several books.

BEFORE—Main Street, Lena, Illinois, before "Tarvia-X" construction.

Mud Disappears Where Tarvia Enters!

AFTER—Main Street, Lena, Illinois, after construction with "Tarvia-X"

THIS is an era of progress. And progress follows the line of least resistance. It can never reach the community that is marooned for weeks at a time in an ocean of hub-deep mud.

Today the entire nation is aware of these facts—is alive to the need for better roads. From farm and town alike, comes the demand for durable, economical, all-year highways. The Age of Mud is giving away to the Age of Tarvia. For in the building of good roads Tarvia is playing a leading part. Road officials and taxpayers know from experience that Tarvia roads give the most for the least money.

Economy of first cost, and economy of maintenance brings smooth, dustless, mudless,

all-year Tarvia roads within the financial reach of even the most humble community.

Tarvia is a coal-tar preparation for use in building new roads and repairing old ones. It reinforces the road surface and makes it not only mudless and dustless but waterproof, frost-proof and automobile-proof. Where existing macadam or gravel can be used as a base the cost of a traffic-proof Tarvia top is extremely low.

Illustrated booklets showing pictures of Tarvia roads in various sections of the country and describing the different methods of applying Tarvia, will be sent free on request to our nearest branch.

Sermons in Wood

IT is a well recognized fact that no material lends itself so effectively to the adornment of the church as beautifully carved wood. Some of the most interesting art treasures of the past are preserved in this expressive medium.

The giving to the church of a pulpit, an altar, a lectern, or other suitable fitment in carved wood, either as a memorial or simply as a tribute to beautify the edifice, is an old and revered custom.

A recent publication of our Ecclesiastical Department is intended to show both the scope of our work and the wealth of opportunity for effective pieces of all kinds, available from our wood carving studios.

If you are interested we will send a booklet on request

THE ASSOCIATIONAL IDEA IN BUSINESS

BY S. WILBUR CORMAN

WHATEVER may be said of thought of the idea of trade and industrial and professional associations, it must be admitted that it is a big idea. Emmett Hay Naylor in his fine book "Trade Associations," published last year, lists no less than 821 of these organizations, and I know of a number that he does not mention. Moreover, new ones are being created almost daily, and relatively few cease to exist once they come into being.

They embrace a wide range of activity—all the way from the American Medical Association, whose members bring most of us into the world, to the Casket Manufacturers' Association, the membership of which takes care of us at the finish.

It has been suggested that trade associations constitute only one aspect of the constantly changing kaleidoscope of American industrialism; that they are the fad of the hour; that they simply represent a new phase of the old game of trying to quell competition; that they are largely a holdover from war conditions; that they are unsound economically, subversive of public welfare, and therefore rightly doomed to rapid extinction.

The underlying idea of men with a mutuality of interest associating themselves together to their common advantage is extremely old—how old I am not prepared to say—but the Bible contains several references to organizations of goldsmiths, apothecaries, etc., and profane literature almost as ancient provides abundant evidence of organizations predicated upon similarity of occupation of the members.

Every one is of course familiar with the fact that there were associations of merchants in Greece and Rome many centuries ago, and the guilds of mediæval Europe were originally merchant guilds, and only later on craft guilds, the progenitors of our modern trade unions.

It is interesting to note, in passing, that Carpenters' Hall, constructed of small imported bricks, was built in Philadelphia in 1770 as the home of the Honorable Society of Carpenters, which would seem to indicate that the English craft guild idea was firmly established in America at that time.

The Hall is still standing. It was the meeting-place of the First Continental Congress of the British Colonies in America in 1774—the real beginning of the associational idea that later developed into the United States of America.

The ancient merchant guild may properly be regarded as the legitimate parent of the modern trade association, although there are of course wide differences of method and administration, perhaps the most noteworthy being the ready acceptance nowadays of the principle that pools and combinations in restraint of trade and industry are inimical to the common good and not to be tolerated.

Many sub-standard practices are now

legal, but it is only fair to observe that the modern straight-thinking business man quite generally would recognize the advantage of standardized 36-inch yards and 16-ounce pounds, even were there no law to curb individual eccentricity in such directions.

Great National trade associations, in the modern sense of the word, came into existence in this country about sixty years ago—there are a large number still going strong with an honorable record of from 25 to 50 years to their credit.

Down through the years, making many mistakes, committing countless blunders, but sound at the core, the idea of co-operation and mutual helpfulness within a given trade or industry has persisted and developed.

No one yet has invented a human institution which is either foolproof or immaculate. Indeed, quite recently our highest court has ordered an association of hardwood lumber manufacturers to discontinue certain practices in restraint of trade and of virtual price fixing.

Secretary Hoover, of the Department of Commerce, has already undertaken to clarify the position of trade associations in their relations to the public and the Government, and I predict that this extremely useful and very interesting tool of modern business will not be lost to us, but, as is so frequently the result in such circumstances, will be made even more efficient and helpful.

The general public is amply protected by the makers and custodians of our legal fabric; but, entirely apart from any such precaution, no trade association has the right to exist if it is not of benefit to those within its membership, to its industry as a whole, to general business, and to the public at large. It is no business to attempt to eliminate the natural and necessary forms of competition.

Every thoughtful American business man knows the difference between fair and unfair competition; every successful trade association must learn the exceedingly simple fact that business grows by building up, and not by tearing down, even if the tearing down operation is directed at the "other fellow." We are all "other fellows" from the "other fellow's" point of view.

It seems to me that we may safely conclude that the associational idea is ancient and worthy; that it is fundamentally sound; that it possesses potentialities of untold benefit to all concerned.

The associational idea is so important a factor in American business that there is even an Association of Trade Association Executives. It is the type of idea that just naturally develops into an ideal.

The greatest ideal in the world to-day is democracy. Three principles are flashing—whether it is better to be governed by a few strong men, by ourselves, or by no one. This struggle is going on everywhere—in world politics; in National, State, and local politics; in industry; in individual businesses.

Generally speaking, a very strong man is usually in favor of being permitted to

\$35,500,000 for New Equipment

IT is the well-known policy of the New York Central Lines to provide as large a reserve of cars and locomotives as can be safely carried through periods of light traffic.

The New York Central Lines have earned a reputation for being forehanded in providing equipment. Two years ago, when Government operation of the railroads terminated, the New York Central lines placed orders for 206 locomotives, 265 passenger cars and 9,244 freight cars, involving an expenditure of \$48,776,000.

The 1922 equipment order calls for 17,500 freight cars and 75 locomotives, entailing an expenditure of \$35,500,000.

This heavy investment in equipment must be made by a railroad system of the magnitude of the New York Central Lines, in order that it may have an equipment reserve to draw upon when traffic rapidly rises with the tide of business recovery.

THE ASSOCIATIONAL IDEA IN BUSINESS (Continued)

rule. He has more confidence in his own wisdom than in mass intelligence. Weak men prefer to be ruled.

But when a nation or an industry is composed of men having a high average of intelligence, courage, and self-reliance you always find a condition unfavorable to autocracy.

Our fathers would not be ruled by others; hence they discovered how to rule themselves. They would have naught of autocracy—they knew that around the corner from autocracy lurks anarchy.

Business has had largely to formulate its own rules—has had to learn how to govern itself. Even governmental laws to control or direct business—aside from those curiously silly ones which most every one nowadays recognizes as having been ill-advised—have sought to establish rules and regulations for business in accordance with already widely accepted standards of good conduct.

Almost every industry has had, at some time, its would-be strong man—its autocrat who sought to establish the customs and practices of that industry. But in no single instance has he been strong enough. American business men have refused to accept autocratic rule. As a result, each industry has known its period of anarchy, of lawless practices, of sinister tendencies pointing straight to wreck and ruin.

And then, almost without exception, American business men have had the character, decency, and wisdom to get together, iron out their differences, root out the evils, and create trade laws acceptable to and observed by all.

I firmly believe that the vast majority of trade associations formed in this country were born of a high-minded, clean purpose to eliminate evil practices, to introduce law and order, and to elevate business. A dishonest or dishonorable purpose is not well expressed in a constitution and by-laws.

Of course mistakes have been made. Many policies have proved unsound. Endeavors to do away with bad practices have sometimes developed other practices almost as bad. Selfishness, unfair competition, treachery, and bad faith are elements that have not been easy completely to eliminate.

Every trade association with which I am familiar has endeavored to benefit its own trade or industry, and usually has succeeded in benefiting business as a whole. The mere getting together and trying to be human and decent to erstwhile hated competitors is really a tremendous step forward.

You can't work with a man to-day on a committee seeking to formulate a code of business ethics, and stick a knife into him to-morrow.

The reason trade associations pretty generally are successful in this country is because American business men pretty generally are honest and decent at heart and want their industries to be the same. That is why they get together and stay together.

THE RISING GENERATION AND THE OUTLOOK

WITH the closing of the schools many letters have come to The Outlook from teachers, telling of the help which The Outlook has given them in the teaching of civics and current events. We publish herewith a few extracts from the many letters which we have received:

I have used The Outlook for current events study in both English and history classes for the past two years. Before that time I used the "—," and I have been careful to study fully the "—" and any other weekly papers as to school use, but I find none so valuable as your own. Though I often disagree with your point of view, yet I find no paper written so clearly and studiously and carefully as yours.

J. M. PINCELL,
Principal of Schools,
Frenchtown, Montana.

My opinion of The Outlook as a basis of study in school work can hardly be expressed. I know had you been in my history class and had seen the keen interest of the pupils you would have been delighted to see them really "drink in" its contents.

EVA DEARDORFF,
Biglerville High School,
Biglerville, Pennsylvania.

In our classes in history we have found The Outlook highly satisfactory this term, especially because of the sanity and the constructive tone with which current problems are handled.

MATTHEW L. DANN,
Richmond Hill High School,
Richmond Hill, New York.

I have found all the numbers of The Outlook very stimulating and superior to any other magazine I have tried to use. The articles have served us as a basis for oral composition and I have enjoyed with my students the discussions which they have provoked.

BERTHE A. DANIEL,
State Teachers College,
Springfield, Missouri.

I am pleased to be able to say that in my two years of history teaching I have found no other magazine equal to The Outlook for weekly current event study.

THELMA EATON,
Maysville High School,
Maysville, Ohio.

Although there are other publications of a similar nature which cover a wider field, The Outlook is better adapted to school needs because it is written in a more scholarly, yet fascinating style.

H. B. BRETNALL,
Denver Public Schools,
Denver, Colorado.

I propose to use The Outlook exclusively as a current events guide during the coming year. During the past year I used the "—" in one class, the "—" in another, and The Outlook in a third. It is my belief that the class using The Outlook made the best progress and knew most about current events at the close of the year.

J. W. SENTMYER,
Principal of
Leonardville Rural High School,
Leonardville, Kansas.

Alluringly Distinctive — these Sweaters, Hats and Scarfs!

WHAT matter whether one plays the game—or not! These sports togs are enticing enough to be their own raison d'être!

The girl in the picture who is preventing the summer breezes from stealing her hat wears a Tuxedo Sweater of Fibre Silk in a new, crinkled weave. Pockets and tasseled belt and smooth front panels are attractive features. In Black, White, Navy, Tan, Orchid, Pearl, and Copen at \$10.50. The hat is a becoming shape with a silk crown, a straw brim, and an under-facing to match the crown. Black stitching ornaments it. Will be made in any color combination you desire at \$15.00.

The second young woman is sure of the fashionable distinction of her Sweater, in a novelty weave of Fibre-Silk and Wool. It comes in all the wanted colors, Navy, Tan, Copen, Red, Black and White, and in combinations of Orchid and Gray, Orchid and Copen, and Black and White, at \$18.50. Her Hat is one of those jaunty little, handy Collegiate Hats of Wool and Fibre Silk. All colors at \$7.50.

Mail orders receive prompt
and careful attention.

BY THE WAY

"Not only Podunk Is, but Podunks Are," a correspondent tells us, anent the skepticism about the reality of Podunk evidenced in a recent article in The Outlook. "In Temple's History of North Brookfield," our informant says, "is a description of land transferred in 1665, 'a meddow which is called Podunk,' with the lands about it. This 'meddow called Podunk' is a part of the town of Brookfield, Massachusetts, and has always been called Podunk. The little settlement has a chapel and a schoolhouse, but is best known because of its close proximity to 'Podunk Pond' or 'Quabaug Lake,' which is more and more becoming a favorite camping ground."

When a foreigner is presented to the Pope, says Mr. Brander Matthews, the Pope has to open the conversation. In the case of Pius IX that shrewd Pontiff often did this by asking how long the stranger had been in Rome. If the answer was "only a few weeks," the Holy Father responded: "Then I suppose you have seen nearly everything." If the answer was "several months," the reply was: "Then I suppose that you are beginning to find your way around." But if the alien proudly declared that he had been in Rome for two or three years, the Pope smiled and remarked: "Then I suppose you have found out that nobody can ever really know Rome!"

Gorillas are the most difficult of wild beasts to capture, according to Dr. W. T. Hornaday, Director of the New York City Zoological Park. He says:

Various schemes have been put forward for capturing full-grown ones, but they have either been rejected or tried and failed. It is impossible by any means that we know of at present to capture a gorilla. Any trap strong enough to hold them would be detected and shunned by them. To attempt to trap them with anything less strong would be attended with great risk of death for the trapper. The use of nets or such devices would be almost certain to result in death for the trapper. The gorillas don't desert their young, and the babies that have been captured have been taken after the mothers have been shot.

An English business man tells in the New York "Times" about the changed attitude of his countrymen toward American visitors: "It is almost proverbial throughout America that we are a nation of frozen faces, aloof and reticent or rude and brusque. In reality, the British attitude toward Americans is that of brother to brother—ready to bicker, chaff and 'grouse' over small matters, but also ready to stand back to back against any outside interference. The war accomplished much toward bringing the Britisher out of his proverbial shell. It is safe to say to-day that ninety-nine out of a hundred Englishmen would welcome a 'pick-up' conversation in a railway compartment or on a bus and that

of New England*

A subscriber writes

"We placed a small advertisement with you in the issue of the 7th inst., asking for 'an elder sister' to be with our daughter for the summer.

"We have had so many replies that it would be impossible to try and answer them all.

"The replies were certainly more than we could have ever hoped for, and we only regret we could not place all of these lovely girls."

If you are in need of a household helper, companion, nurse, governess, teacher, or business or professional assistant, try a "Want Ad" in the classified section of THE OUTLOOK

WOMAN living in the country ten miles from Philadelphia, having been successful with children now grown, would like to have the care of one or two normal children. Services exchanged. 1,752, Outlook.

BY THE WAY—(Continued)

they would go to any length to be of assistance to a stranger. So England is planning for the visits of Americans this summer as though they were simply relatives."

Chauncey M. Depew, in his Reminiscences, puts Wendell Phillips and Henry Ward Beecher in the first rank of famous orators. Of Phillips he says: "I have heard most of the great orators of the world, but none of them produced such an immediate and lasting effect upon their audience as Wendell Phillips." Of Beecher: "As an after-dinner speaker the most remarkable in effectiveness and inspiration of the men of my time was Henry Ward Beecher." Robert G. Ingersoll he characterizes as exercising in his speeches "the spell of a magician." Lord Rosebery, he declares, is "the prince of after-dinner speakers in England."

One of the most remarkable oratorical occasions described by Mr. Depew was

the famous dinner in New York City at which General Sherman, "an orator as well as a fighter," gave a wonderful word picture of the great review in Washington of the victorious Union Army at the close of the Civil War and its subsequent disbandment and the return of its members to their peaceful homes. This speech was followed by an equally remarkable address by Henry W. Grady, of Georgia, in which he told of the home-coming of the Confederate Army, defeated, ragged, poor, but with undaunted courage taking up the battle of life in their poverty-stricken homes. Each of these "triumphant epics," Mr. Depew says, stirred its hearers to the highest degree of enthusiasm.

Of Mr. Beecher's impromptu sallies Mr. Depew gives one example. In his English campaign in 1863 a heckler said: "If you people of the North are so strong and your cause is so good, why after all these years of fighting have you not licked the South?" Mr. Beecher replied: "If the Southerners

were Englishmen, we would have licked them!" The audacity and the humor of the retort brought down the house.

Under the heading, "Was it John Hay who Originated the Sovereign Quip?" the New York "Herald" publishes a letter which says that when John Hay was asked by an English visitor at Mount Vernon, "Really, now, George Washington could not have thrown a dollar across the Potomac, could he?" the diplomat answered, "Why not? He threw a sovereign across the Atlantic." Another correspondent tells the "Herald" in the same column that it wasn't the Potomac that was used by Washington to give point to the joke, but the Natural Bridge of Virginia, over which G. W. cast a Spanish milled dollar. We prefer the Potomac version.

A schoolboy's variation of this jest, it will be recalled, made Julius Cæsar a "bigger man" than our National hero. It read: "Julius Cæsar was renowned for his strength. He threw a bridge across the Rhine."

A Special Introductory Offer

The Next 13 Numbers Of The Outlook Only \$1

EVERY issue of The Outlook is read by many people who are not regular subscribers. In order to make it possible for occasional readers to become better acquainted with the character of the journal and to see it regularly each week for a trial period at but slight expense, we make the following special offer:

We will send The Outlook each week for the next three months (13 numbers) for the small sum of \$1 to any one who is not now a subscriber. The regular yearly subscription price is \$5, and this offer is made to non-subscribers in order to show them what they are missing by not having The Outlook each week.

Why You Will Need The Outlook During Your Summer Vacationing

Wherever your summer jaunts may take you, The Outlook will reach you each week. Due to a remarkably efficient change-of-address department, we can guarantee immediate action on all change-of-address orders received by us. Other periodicals often require from two to six weeks to get action on such orders. But no matter how often, or how quickly, you change your summer whereabouts, The Outlook will be there each week to keep you clearly, reliably, and authoritatively informed as to what is happening in the world. Many of our readers will get along without newspapers this summer—but not without The Outlook.

A Journal Read By Statesmen

Each number contains hours of reading, all of which is bracing, refreshing, and brain-expanding. Distinguished contributors write for every issue. The fascinating running story of the world's progress is prepared for you by eminent journalists, statesmen, diplomatists, scientists, men of letters, artists, educators, and business men. The terse weekly editorial summary and interpretation of the world's news is world-famous. In Japan, for instance, according to one of the leading Japanese publicists, The Outlook is the most popular of all American periodicals. At home it is the most-quoted periodical on the floor of Congress.

"The Most-Quoted Weekly Journal In America"

You have noticed, of course, that the leading newspapers of the country are almost constantly quoting from The Outlook, which is noted for getting hold of

articles of such sharp and timely interest and importance that their publication is actually a matter of news. But why rely upon the fragmentary reports in the newspapers, when you can have the entire, unabridged contents of each week's issue of The Outlook before you for the next 13 weeks for the small sum of only \$1?

By starting your trial subscription at once, you will be sure to get all of the striking articles that are scheduled for the summer.

Engrossing Exclusive Features

FIRST in position and importance in each issue of The Outlook is the editorial survey of the outstanding events of that week, discussed without partisanship or prejudice and with first hand knowledge and conviction.

LYMAN ABBOTT, dean of American editors, frequently contributes signed editorials and "Knoll Papers."

GOVERNOR HARRY L. DAVIS, of Ohio, writes an article entitled "Death by Law," in which he marshals powerful evidence against capital punishment.

NEWTON FUESSLE contributes the story of Uncle Sam as a gigantic road builder.

GARRARD HARRIS, an associate editor of the Birmingham, Alabama, "News," tells the story of the founding and subsequent activities of the largest and most active sportsmen's association in the United States.

ELSIE SINGMASTER, the American novelist, is represented by a searching short story entitled "The God in the Machine."

"BY THE BLACK HEARTHSTONE" is a most illuminating interpretation by a Southerner of Negro life.

"THE RIGHT TO WORK" is a stirring plea by Kingsley Moses, the industrial writer, for the vocational rehabilitation of crippled or physically disabled men and women.

JOSEPH DANZIGER is the author of an important article concerning the present economic and financial conditions in Germany.

"OVER THE HILL TO THE RICH HOUSE" is the intriguing title of a short story about some poor rich people, written in a masterly fashion by Conrad Richter.

To all progressive Americans, whether they come from the North or the South, Rollin Lynde Hartt's article entitled "In Fairness to the South" will prove interesting and enlightening.

POEMS of distinction by Hermann Hagedorn, Harry Lee, Leslie Nelson Jennings, Hilda Conkling, Herbert Gorman, and Marion Couthouy Smith will appear

THE BOOK TABLE, a feature each week, is conceded to be one of the really important literary departments appearing in American periodicals.

NEW PRIZE CONTESTS will be announced from time to time. Substantial cash prizes will be awarded to writers of winning letters.

Every issue of The Outlook is profusely illustrated with news photographs and the best cartoons.

By signing the coupon to-day and mailing it to us with your remittance you will receive one of the biggest and most useful and refreshing dollar's worth of reading ever offered.

LUCY FURMAN, who is at present writing a series of stories, "The Quare Women," for the "Atlantic Monthly," gives to The Outlook an engrossing account of the efforts of the sheriff of Knott County, Kentucky, to put a stop to the making of moonshine liquor by the Kentucky mountain people. Miss Furman has been living for many years at Hindman, on the forks of Troublesome Creek, associated with the Hindman Settlement School. She has written a number of stories about the mountain people, which have been published in magazine and book form.

HERBERT GORMAN is contributing assistant to the New York "Times" Magazine and Book Review Section and the author of numerous critical essays. A volume of his poems will be published in the fall by G. P. Putnam's Sons under the title of "The Barcarole of James Smith."

ARTHUR CHAPMAN is well known as a successful portrayer of the West. He is the author of a novel, "Mystery Ranch," and two volumes of Western verse, "Cactus Center" and "Out Where the West Begins." There have been Easterners who, after reading the title poem of this last volume, have been unkind enough to ask, "Well, if what Mr. Chapman says about the West is true, what the dickens is he doing in New York?" He is at present working as a special writer for the New York Sunday "Tribune."

ANNIE B. KEER, as the executive of the Brooklyn International Institute, which is a branch of the Y. W. C. A., is constantly in touch with the immigrant girls and learns some thrilling stories, many of them too personal for publication. The story which she tells in this issue is the record of an actual experience. During the war she was director of the Y. W. C. A. Hostess House at Camp Dodge, Iowa, and before that connected with a social settlement house in Chicago.

HENRY HOYT MOORE'S photographs of Bar Harbor and Mount Desert Island will make many a vacationer long to turn his steps in that direction. Mr. Moore is art manager of The Outlook and a devotee of photography.

EDWARD K. PARKINSON, the author of "A Garden Without Lineage," which appeared in The Outlook last week, turns in the present issue to mid-summer flowers. He has spent a number of years in the country and has written two books on outdoor subjects. He was at one time on the staff of the "Country Gentleman" and for four years with the New York "Evening Post."

MAJOR-GENERAL SIR GEORGE ASTON is familiar to Outlook readers as the author of two articles on British political questions previously published in The Outlook. He has had a notable military career and is the author of "Letters on Amphibious Wars," "Sea, Land, and Air Strategy," etc.

JULY 12, 1922

THE COAL CONFERENCE

ONE strong reason for believing that the coal conference called by President Harding, assembling as we write, will bring results is that results simply must be had. For three months workers and operators have debated without a sign of settlement. Already danger is in sight. In the anthracite industry a coal shortage and sustained high prices in the fall are all but certain—and, although the hard-coal industry is small as compared with the soft-coal industry, it comes close to the comfort and the pockets of millions of consumers. In this field hardly a ton has been mined since April. In the bituminous field the non-union miners have produced considerable quantities, but the total output does not begin to meet the need, and the surplus supplies are dwindling fast.

It was proper that time should be given for peaceful adjustment of this deplorable industrial war by the contending forces before the President intervened. He was not to assume that a business bargain could not be reached. In the great coal controversy of 1902 President Roosevelt did not act until the strike had been under way for several months. When he did move, he acted with power, directness, and the clear declaration that if the conference didn't settle the trouble he would. Now the time has come in this fight for the Government to intervene and to demand and get results. President Harding, Secretary Hoover of the Department of Commerce, and Secretary Davis of the Department of Labor will doubtless not merely urge action on the fifty or more representatives of miners and operatives now in conference, but require action.

It is gratifying to note that President Harding and his advisers even before the conference met set forth in a determined way their belief that the conference should not merely arbitrate on the claims and counter-claims of miners and operators, but should provide a permanent way of avoiding such conflicts in the future. In concrete form this means some plan to get at the actual causes of the trouble. In the larger field, that of the soft-coal industry, practically every one recognizes that the basic trouble is over-production, the existence of too many mines, and the employment of many thousand more miners than are

JOHN L. LEWIS (LEFT), PRESIDENT OF THE UNITED MINE WORKERS, IN CONFERENCE WITH SECRETARY OF LABOR DAVIS AT WASHINGTON

needed to supply the country. A semi-official statement from administrative sources says that forty per cent more people are engaged in the mining industry than would be needed if every miner were guaranteed regular employment through the year and that hundreds of mines are in operation which cannot be worked economically. In the hard-coal industry the miners should recognize the need of reduction in wages under the reduced cost of living, while the operators should recognize the force of the miners' demand for regular instead of spasmodic employment and the consumers' demand that the question of profit and distribution as well as of operation should be gone into thoroughly by Governmental authority.

REDUCING A LAW TO ABSURDITY

ON the last day of June New York Harbor witnessed a scene which furnished very adequate proof of the absurdity of our present Immigration Law—a law which limits the admission of aliens to a certain proportion of the numbers of their own nationality now resident in the United States. If the scene had not been a real tragedy, it would have evoked laughter, loud and prolonged.

The fiscal year for the immigrant allotments ended on June 30. On that evening twelve steamships loaded with immigrants lay outside the harbor waiting to dash across the line at midnight. This race was caused by the fact that the quota allotted to some countries is

so small that the passengers of a single steamer might fill it to overflowing. Then the steamer which lost the race might be subject to fine for importing immigrants in excess of the allowed quota and liable to be forced to pay for their deportation expenses. The desirability of the immigrants in the second steamer of course would not enter into the matter at all. It is a case of first come, first served, the last to be served and considered, apparently, being Uncle Sam himself.

The situation was further complicated by the fact that New York City is on a Daylight-Saving schedule. The Federal Government, however, recognizes no such device for shifting the habits of mankind. Some of the steamers were advised to enter the port on Daylight-Saving time, while others waited for the old-time midnight. This discrepancy of opinion will apparently afford enough basis for argument to keep both sea and land lawyers occupied for a longer period of time than the Daylight-Saving schedule has salvaged for all the inhabitants of the metropolis.

A CRUSADER DEPARTS

"PUSSYFOOT" JOHNSON, perhaps the most picturesque and certainly one of the most effective leaders in the prohibition movement, has recently sailed for England. He departed on a British ship because he preferred to sail on a vessel which sold liquor legally than on a liner of the United States Shipping Board, which justifies the sale of liquor

on what is at best nothing more than a legal quibble.

An interview with Mr. Johnson appeared in the New York "World" on the day of his departure. The "World," as every one knows, is not particularly partial to prohibition. In fact, some of its readers have suspected that its editors might even be willing to see the Eighteenth Amendment repealed. However that may be, they can certainly find food, or perhaps drink, for thought in some of Mr. Johnson's statements which appeared in their journal. Mr. Johnson is quoted as saying:

If the Association Against the Prohibition Amendment had started to advocate beer and light wines ten years ago, instead of last year, I think that the United States would still have them. The brewers did themselves in. The drys originally advocated beer and the first State laws permitted it. But the brewers owned the saloons that sold the whisky, and so the brewers were the people the drys had to fight.

The distillers, in my opinion, were a decent bunch. It was the brewers who played dirty politics and ran immoral resorts. For that reason the Anti-Saloon League had to clean up the brewers. If we could have trusted them we might have let beer and natural wines alone.

Mr. Johnson continues:

If these personal liberty howlers and moderate drinkers can work out some system by which the liquor traffic can be controlled and not prohibited, I will listen to them. But I have been in this business for forty years and I have never seen a successful system that stopped short of absolute prohibition.

In these two statements can be found the chief reasons why the United States is to-day a prohibition country.

The manufacturers of alcoholic drinks did little or nothing to eliminate the gross evils of the traffic by which they profited. The moderate drinkers hardly lifted a finger to curb the insatiate greed of the liquor trade.

There is one more statement in the "World's" interview with Mr. Johnson which should be taken to heart by those who fear that the Prohibition Amendment and the Volstead Act will be followed by other analogous restrictions upon smoking, dancing, and sport. There are men and women in the prohibition movement who do believe in such restrictions as Mr. Johnson points out, but he also gives the reason why their views cannot and should not prevail. He says: "I've never heard of a man coming home from a dance and chucking his baby out through the transom or of a man suddenly deciding after his fifth cigar to wipe his shoes on his neighbor's mustache, or of a base-

ball man saying it with flatirons to his wife."

A CALVINIST HONORED BY JEWS

WHEN recently Bishop Dezsö Baltazar, the head of the Protestant Church in Hungary, came to this country, his warmest reception was from Hungarian Jews. The reason of this is that in Hungary he stands for scholarship and the brotherhood of man, and not for race or religious prejudice. The great college at Debreczin, in Hungary, over which he presides—a Calvinistic college in its origin, as we understand—is open as freely to Jews as it is to Protestants, and is a center of liberal thought as well as of scholarly and literary culture. An American Jew tells us that this is the only college in Hungary where Jews are on equal terms with others in law, theology, literature, journalism, and business. The college has had some five thousand students. There is danger now that it may be closed under the stringent conditions and deprivations of life in Hungary to-day. Therefore Bishop Baltazar visits this country in order to obtain aid for his great educational work.

A Hungarian journal in New York prints in English a welcome to the Bishop from Dr. Samuel Buchler, President of the Federation of Hungarian Jews in America, who goes so far in his title as to call Dr. Baltazar "the first honest visitor," a reflection on the Hungarian political propagandists who have flooded America with appeals for sympathy in behalf of Horthy, the would-be radical dictator.

When Louis Kossuth visited the United States nearly seventy years ago, he was hailed by Americans and by the American Congress, not only as a statesman, educator, and poet, but as a friend of the democratic world spirit. He swore that he would never tread on Hungarian soil as long as a Hapsburg ruled. Now the Hapsburgs and what they stood for have departed, and Americans may rightly remember that our Congress promised Kossuth to aid the Magyars if the time came when they could free themselves from oppression. Bishop Baltazar, who now visits us, is, like Kossuth, educator, statesman, and poet, and, like Kossuth also, is an idealist. His college carries on traditions for culture a thousand years old and a literature much of which, and especially the works of the versatile and brilliant Maurus Jókai, has been translated into many languages. To aid this venerable and valuable institution to continue its work is a privilege which doubtless many Americans will gladly exercise.

FINGER-PRINTS IN ART

IF the lawsuit now said to be impending over the genuineness of a certain ancient painting ever comes to trial, it bids fair to be both unique and amusing. It is proposed to apply the modern finger-print test to a canvas which either was or was not painted by Leonardo Da Vinci almost four hundred years ago.

The history of this odd case, in brief, is that Madame Andrée Hahn possesses a painting which she declares is the original or a replica (not a copy) of Da Vinci's "La Belle Feronnière." She brought it to America two years ago, and almost sold it to the Art Institute in Kansas City; \$500,000 was the price proposed.

Unhappily for the sale, Sir Joseph Duveen, English art dealer and expert, saw this painting in New York and, so at least the story goes, declared offhand that it was not the work of Da Vinci and that the familiar painting in the Louvre was the only original of "La Belle Feronnière."

Now Madame Hahn naturally considers herself deeply injured in dollars, as well as in feeling, at this aspersion, and is suing Sir Joseph for damages. She proposes to prove her case by the Bertillon system of finger-prints. She and her experts allege that Da Vinci was always accustomed to use his thumb and little finger in finishing a picture, smoothing down this bit or smudging that bit. She alleges also that in original Da Vinci masterpieces these finger-print marks are perfectly visible, and, while they can be, and probably have been, imitated, the imitation would not extend to the whorls and characteristic lines which make the imprint of one person's finger absolutely different from that of any other person.

This is a delightful theory, and for the sake of romance we hope that it is true. At all events, the press reports that Europe is now being scoured by little bands of microscopists, finger-print experts, and photographers, some of whom are acting for the plaintiff and some for the defendant in this case. The outcome as it might appear in a cross-examination in a court-room would be something that only our friend Mr. E. V. Lucas could deal with adequately.

It is only fair to present the other side of the interesting discussion as told to a reporter by one of Sir Joseph's lawyers. He says:

Of course any hope of Mme. Hahn to prove that hers is the original "La Belle Feronnière" by trying to show that the finger and thumb prints on her painting are identical with those on other and proved Da Vincis is absurd. Suppose, for the sake of argument, that the master did thumb and

finger his paintings. What of it? Why, he died in 1519, and every one of his canvases has been retouched and varnished and wear-proofed any number of times. Do you think there is anything left of his original fingerprints? Nonsense!

Besides, the Court might insist that the originals be produced here in New York during the trial. Now, I leave it to you, isn't it absurd to consider for a moment that any such thing could be done?

This is all very well, but what every one wants is to have the trial first and the argument afterwards. We hope that no mere scientific technicalities will stand in the way.

A PRINCE-SCIENTIST

PRINCE ALBERT of Monaco was a scientist of distinction. To most readers the name Monaco calls forth a picture of the great Monte Carlo Casino, which is the best-known and probably the largest gambling establishment in the world. The Prince of Monaco, who has just died at the age of seventy-four, had nothing to do directly with Monte Carlo. The lease under which it is carried on was originally made before he ascended the throne of the smallest independent sovereignty in Europe—it contains about eight square miles. It may be that this lease has been renewed since Prince Albert's reign, but otherwise he apparently took no interest in the matter. It is true, however, that not only the expenses of the Government of Monaco come from this source, but also, directly or indirectly, the income of many of its charitable activities. Prince Albert's ancestors have ruled since the year 968.

The scientific field in which the Prince of Monaco was chiefly interested was that of oceanography. He built several beautiful yachts one after the other, which he has employed in deep-sea dredging and exploration. The result has been many discoveries of positive interest to scientists and a great deal of light and information as regards deep-sea problems. He was also much interested in palæontology.

The Prince's interest in science has been shown in another way—that is, by the founding of the Oceanographic Museum at Monaco, which contains one of the finest aquariums in the world, with many adjuncts for the study of sea life. The other is a similar institute situated in Paris close to the Sorbonne, and of great service to students of this branch of science. In the World War Prince Albert was loyal to the Allies; thousands of American wounded soldiers recuperated at his private estate in Monaco.

The Prince of Monaco has visited this

PRINCE ALBERT OF MONACO

country three times and has been received with high honor as an investigating naturalist and a man whose work in his chosen field has been thorough, and even extraordinary. When Prince Albert was here in 1913, a writer in *The Outlook* who met him described him as an agreeable, cultivated man, having the unostentatious behavior of a scholar and notable for "his democratic simplicity and his complete lack of self-consciousness and egotism."

THE OBSERVATIONS OF A CORRESPONDENT IN THE FAR EAST

WITH American flags tied to their luggage and with two American marines sitting in the baggage car watching their trunks, Isaac F. Marcossou, one of the best known of American correspondents, and Ray Atherton, First Secretary of the American Legation at Peking, made their way out of Peking through the zones of the armies which were then engaged in civil war in China. Mr. Marcossou had been spending about five months in the study of economic and political conditions in China and Japan. He has now returned to this country.

In an interview printed in a recent issue of the New York "Times" Mr. Marcossou has reported some of the conclusions he has reached as a result of his observations in the Far East.

In part at least as a consequence of the Washington Conference, Japan, he thinks, has changed her policy toward other countries, including China. This change he characterizes as a "right-about-face." And he considers it not

merely an outward change, but a "change of heart." Japan, he is quoted as saying, "has discovered that her policy of aggression and forceful penetration is a huge mistake. Had she continued as before, she would have been internationally isolated so far as world friendship is concerned." As a consequence of the Washington Conference, she has found it impossible to continue her old policy of corruption and intimidation in China, and is now seeking China's friendship. As evidence of her new policy, he cites her withdrawal from Shantung and her professed determination to withdraw her troops from even Manchuria and Siberia. Mr. Marcossou was struck by the undoubted growth of liberalism in Japan, and found that that growth had been greatly helped by the Washington Conference. Moreover, he has become convinced that the economic situation in Japan has made it impossible for Japan to pursue successfully an aggressive policy, for Japan's economic resources would not permit her to wage war on the modern scale, and the serious economic crisis which Japan is approaching engages her whole attention. Indeed, in this respect the Washington Conference had good effect, for, by relieving her of a naval programme beyond her fiscal resources, it really saved her from national bankruptcy.

These conclusions are not those of a sentimentalist, but of a practical and experienced observer who has been able to see the way in which Japan's legitimate self-interest as well as the idealism of a large part of her people is guiding her toward a policy that means the welfare of other nations as well as her own and toward peace in the Pacific.

China, too, has been benefited by the Washington Conference, and is consequently grateful. The fighting in the civil war there Mr. Marcossou describes as noisy but not deadly. Dr. Sun he regards as a visionary who has now the opportunity to make the sacrifice he said he was willing to make for the unification of China. General Wu Pei-fu Mr. Marcossou regards as "a strong and commanding figure, and that rarest of all Chinese specimens, an honest official." Because government as such in China has been a joke for so long, any prophecy about China is futile, he thinks; but he ventures the opinion that the "unification of China will be a slow process because of the endless jealousy and corruption." He believes that Americans have an opportunity in developing trade in China which they are not availing themselves of because the right kind of agents are not sent there to get the business. He believes

SENATOR P. J. McCUMBER

that the China Trade Act and the existence of an adequate merchant marine enable the United States now to compete in the Far East with other nations on a better basis than ever before.

ANOTHER REPUBLICAN DEFEATED—BY A REPUBLICAN

SENATOR PORTER J. McCUMBER, Chairman of the Senate Finance Committee, has failed of renomination in the Republican primaries of North Dakota. The nomination has been won by Lynn J. Frazier, a follower of Townley and former Non-Partisan League Governor of North Dakota, who was recalled from office last November. That the defeat of Senator McCumber does not imply a complete victory for the Non-Partisan League is shown by the fact that the present Governor of North Dakota, Mr. R. A. Nestos, was renominated in the same primary election in which Senator McCumber went down to defeat. Governor Nestos is an Independent Republican who is an opponent of Townleyism.

Senator Ladd, Republican Senator from North Dakota, a Non-Partisan Leaguer, comments upon the defeat of his colleague in the following words:

With the passing of P. J. McCumber from the Senate the Northwest loses the chairmanship of the great and powerful Finance Committee, an ardent protectionist and a staunch, uncompromising Republican of the old school. With the coming of Lynn J. Frazier North Dakota sends to the Senate a thoroughly progressive Republican of the modern school, a man who has gained and holds the confidence of the common people of the State as few men can do, a man thoroughly trained and seasoned in administrative affairs, and who, I predict, because of his wide acquaintance

with the needs of the farmers and laborers of the entire country, will exert a strong influence for good legislation through the agricultural bloc.

Some of the measures which Mr. Frazier supported as Governor certainly are beyond the scope of what is generally accepted as progressive Republicanism. Among such measures may be included those guaranteeing bank deposits, providing exemption of farm improvements and of small city homes from taxes, and requiring dealers to carry a full line of repairs for all machines sold in North Dakota. Senator McCumber's defeat has been variously attributed to his position in favor of the bonus, to his prominence in framing the high tariff bill now before Congress, and to his support of the seating of Senator Newberry; but it probably is due chiefly to the fact that he neither went far enough in radicalism to suit the Non-Partisan League nor opposed radicalism strongly enough to satisfy the more moderate wing of his party.

IDEALISM AND THE POLITICAL MACHINE

GIFFORD PINCHOT, the Republican candidate for Governor in Pennsylvania, is a representative idealist in politics. It may be said that he is in a sense a practical idealist, because he has brought things to pass for the welfare of his country. But he would be the first to acknowledge that he is far removed from an experimental mastery of political mechanics. And from now on, in his career in Pennsylvania, he is sure to be face to face at every stage with the problem of the political machine. Cameron is gone and Quay is gone and Penrose is gone, and the machine is shaken, but it still exists, and the regular voting psychology of Pennsylvania, which is the support of the machine, still exists. As we see it, the problem of Gifford Pinchot is to manage his idealism in terms of political organization.

Since the recent primary the old order has shown its hand and power by electing a chairman of the State Committee who was opposed by the new candidate for Governor. Very likely Mr. Pinchot is wondering why the Pennsylvania Republican machine should act in such a fashion and at the same time highly resolve to help to elect him Governor in November. Perhaps he is inclined to suspect the Greeks bearing gifts. It may be, however, that these seemingly irreconcilable attitudes are entirely understandable and consistent. As conditions stand in the country, the Republi-

LYNN J. FRAZIER

can machine will have little stomach for defeating Gifford Pinchot. We regard his election as assured by a large majority after the vigorous campaign which he is capable of making. And the machine will help. But the machine, like the king, never dies. The machine is dead; long live the machine! is the continuing psychology of the regular political organization. The machine was beaten this year in Pennsylvania, badly beaten. But there are other years and other campaigns. And it is the psychology of political regularity always to keep the machinery intact in preparation for a turn in fortune. This explains, we think, why the Pennsylvania politicians did not with docility turn the organization over to Pinchot. It does not mean at all that they intend to knife him at the polls. They are holding on to the State Committee, for which Pinchot did not fight in the primary campaign, hoping for a better day.

The people of Pennsylvania and of the country expect Gifford Pinchot to continue to be an idealist. He has a great task to perform in aerating the political atmosphere of Pennsylvania and of reconstructing its governmental life. He cannot spend his time in petty stratagems and spoils. He is not the natural heir of Cameron and Quay and Penrose in the mastery of the machine. But we are anxious to see, and we expect to see, him temper his native idealism with practicality in the great work upon which he has now entered. His course in Pennsylvania will be imitated all over the country. His practical success will mean much to political progress in the United States. A political machine is never altogether bad. Sometimes it

comes nearer to being altogether good than some reforming coteries. In Pennsylvania the machine has had a tainted history. But the new Governor will undoubtedly find great sections of it which are sound at heart and wish to do right. Those sections of the machine, we think, he should cultivate and strengthen as the Governor of a great State has opportunity to do, and at the same time inspire them with a measure of his own idealism and vision. If a large section of the regular organization looks to the Governor as leader, even though it may be a minority section, it will be a controlling power. The majority will gradually come to follow on, and the minority will eventually become the majority.

We hope, and expect to see, Gifford Pinchot governing Pennsylvania with practical idealism, subduing the machine slowly by practical wisdom. The regular party organization has a function in American affairs, else it would not be so tenacious of life and influence. We are living in a period when more is to be gained by attempting to mold it than by attempting to wreck it. The great Roosevelt revolt in 1912 was like an earthquake, shattering the thickened crust of reaction in party affairs. It was a very necessary earthquake. Now we think the time for construction has come.

THE THREATENED RAILWAY STRIKE

AS they left the city for four days of vacation over the Fourth of July, many people on Friday, June 30, undoubtedly wondered how they might have to manage in order to find their way back. When they left, trains were running as usual; but they had some reason to fear that four days later passenger train service might be at the best irregular. They had read about the strike of four hundred thousand railway shop workers which according to the votes of the men involved was to begin at ten o'clock on the morning of the first of July. They had read of the proposal that men engaged in the work of maintaining railway tracks in good order should also strike. They had read also of the threatened strike of other groups of railway workers. Other people not planning to leave the city had read of the preparation made by the authorities of the city and the State, and even of the Nation, to substitute for the possible suspended railway transportation other means of getting food into the city. If there was little evidence of alarm at the prospects of the strike, it

DYNAMITE

fish traps, seines, lime jugs, these were the conventional tools of the Alabama miner or farmer who wanted to get fish a few years ago. The result was to be found in fishless lakes and sterile streams. The dynamiter and the seiner have not been wholly eliminated from Alabama; they are to be found there just as they are to be found in other States. But the people of Alabama have waked up to the abuse of their waters. The fight to educate Alabama started with the election of John H. Wallace to the Legislature some twelve years ago. It received a powerful impetus when an editor of the Birmingham "News" went fishing in a fishless stream in 1921. The story of what the sportsmen of Alabama have accomplished since that time is graphically told

By

GARRARD HARRIS

in a forthcoming article entitled

Alabama Goes Fishing

was probably due to the strong hope, if not expectation, that the strike would be averted, or at least that the walk-out of men not actually engaged in the operation of trains would have little, if any, effect upon the train schedules. Nevertheless the fact that the people of the Nation have been thinking of the discomfort, the injury, the possible disaster of a Nation-wide strike of railway workers has made all sorts of people wonder again whether it will always be necessary for industry, especially the business of maintaining and operating the steel highways of the Nation, to be carried on as if it were a species of war.

Those who had believed that as long as train crews kept on their job the railways would remain running were perhaps forgetful of the fact that the men in roundhouses and on the rights of way and in the signal towers are really quite as essential in the operation of a railway as those who drive or fire the engines or those who collect the tickets or those who care for the train. It is true that the brotherhoods of engineers, firemen, and trainmen had made no plans to strike; but they had received orders that their members were not to do any of the work that was to be abandoned

by the shopmen. That meant that they were not to move or even clean engines or couple or uncouple cars that had been left by train crews after the day's run. The public which uses trains but knows little about them had not perhaps sufficiently realized how complicated the operation of a railway is and how the different parts of the process of railroad-ing depend on one another. It takes its railways, as it does the tides or the winds of heaven, very much for granted.

Indeed, the public has to take the railways for granted. Under modern conditions of life it can hardly do otherwise. Not even at the height of the war in Europe was life more thoroughly disarranged than when the normal train service of France was suspended in order that the railways might be used exclusively for mobilizing troops. In this respect a really complete strike on the railways of this country would be as upsetting and demoralizing as the beginning of a war.

Concerning the merits of the dispute which led to the strike vote of the railway men during June the public has no adequate means for forming a judgment from first-hand acquaintance with the facts. Concerning these facts it has not been and cannot be fully and authoritatively informed by the press. Fortunately, it does not need to be. The American people, through their National legislative body, have constituted a tribunal for the determination of just such issues. The Railroad Labor Board has been fully informed by hearings of the need of the railways for a reduction in their costs, and specifically a reduction in the cost of labor, and, on the other hand, the demand of employees for a wage that will enable their families to live according to American standards. The Railroad Labor Board has approved a reduction of wages for certain classes of employees. Those who protest against this reduction declare that it means that in some cases a man will be forced to try to support his family on eleven dollars a week, and that, contrary to public policy, to the interest of the wage-earners, and even to Governmental authority, some railways have let contracts to private concerns for the repair of their rolling stock instead of making repairs in their own shops. Into such questions we are not called upon to go. The Railroad Labor Board, constituted for the very purpose of settling such questions, has made its decisions. It is the prime interest of the public to insist that the railway employees and the railway managers alike conform to the decisions made by the Railroad Labor Board within its lawful jurisdiction. It is only by constituting some such au-

thority over both the managers and the employees and then by supporting that authority with all its might that the public can prevent its highways from becoming the "no-man's land" of an industrial war.

Naturally, the men who have been subjected to the disagreeable experience of having their wages reduced are going to voice their objections. Nobody can blame them for objecting. But they should not be allowed to make their objection in the form of a strike that will paralyze any part of the essential transportation system of the country. A strike of that sort is not a strike against the managers primarily. It is a strike against the authority of the Railroad Labor Board, and therefore against those whom that Board represents—the people of the country. The men have a right to appeal to the courts and to public opinion; but they ought not to be given the privilege of conspiring to undermine the authority of the tribunal which the people have established for their own protection.

Men of the railway unions, moreover, should come to realize that hardship is not of itself a justification for a strike. They must realize that the whole country is passing through a period of deflation, and that it can pass through that period successfully only as people generally accept their share of it. If the railways, in "farming out" contracts for repair work, have violated an agreement or have adopted a policy disapproved by competent authority, they should be made to observe their obligations in good faith. In farming out these contracts, it is argued, the railways have simply taken measures to prevent waste and needless expense, and to this extent are contributing to the process of deflation. To a large extent, however, it is reported, the railways have shown a willingness to abandon the practice and to do all possible repair work in their own shops. If, nevertheless, the railway shopmen must find jobs elsewhere or must accept reduced wages in their present places, they may have to accept the hardship as part of the process of deflation which the country at large has had to experience and which has been a greater hardship to farmers, perhaps than to men of any other calling.

Perhaps the prevention of industrial war has to await the creation of some instrument of governmental authority so powerful that no element in the community will dare defy it. We hope that, if it is necessary, the people of the country will not hesitate to create such an instrument of authority. We hope, however, still more strongly that it will

not be necessary for the Government to have recourse to any such capital operation. A better solution is an appeal not to authority but to co-operation and understanding. Such a solution is not a mere dream. It is in existence at least as an experiment in one great railway system of this country. The Pennsylvania Railroad is largely free from the menace of this strike because it has wisely adopted a system of shop representation which provides means by which managers and men can establish and maintain mutual understanding. If that system weathers this storm, it will be one more proof of the truth that has been expressed in homely language, that molasses catches more flies than vinegar. Such mutual understanding is, after all, at the base of that spirit of democracy which is the life of our political system, and should be the life of all our industry.

THE VICTORY OF THE IRISH FREE STATE

THE plan for establishing in Southern Ireland a Free State the people of which should have that kind of self-government Canadians have long possessed, had already, before the outbreak just quelled, stood the test of approval by a majority of the Dail Eireann and that of approval at a popular election. Now it has stood the test of revolution. The insurgents who under Rory O'Connor as their general seized and held as a fortress the historic Four Courts building in Dublin fought with courage and desperation against the forces of the Provisional Free State and surrendered only after they had suffered severe losses in dead and wounded. But the Free State victory was complete.

Two utterances just after the surrender have a hopeful significance for the future. One was that of Michael Collins, head of the present temporary Free State administration. He said that he was determined to make every inch of Ireland under control of his Government safe for persons and property. The other was an agreement between commandants of Free State and Republican forces after a fight at Listowel to the effect that, as Ireland's interests were not served by civil war, they as patriotic Irishmen would unite for the common welfare. If these two principles gain general acceptance in Ireland, the future of the country may be brighter than it has been since the Home Rule Bill passed before the war.

There may be a healthful clearing of the air now that the minority have resorted to open war in place of assassina-

tion, kidnapping, and brutal destructiveness. If the Dublin revolution fails to stir up a civil war throughout Southern Ireland, the outbreak and its collapse will go far to convince the irreconcilables that the country is not with them, and that they cannot rally an armed force that would have any chance whatever against the organized and authorized army of the Free State.

The political fanatics whose hearts and brains are fired with hatred of England and who think more of revenge than they do of peace or prosperity can never be convinced—and, unfortunately, they form a very large class in Ireland. They never were in the majority; they never were fit to carry on government; they have now been shown that the people of Southern Ireland are not willing to sustain indefinitely the horrors of guerrilla warfare in the vain pursuit of the chimera of an Ireland totally separated from Great Britain. General Jan Smuts, more than any other man, convinced the Irish people at large that, whatever their aspirations for independence in the far future, they may well be willing for the present to have the liberty of action and self-government that satisfies the Canadian, the Australian, and the citizen of the South African Republic.

The case was quietly and forcefully put by the Provisional Government just before it proceeded to put down the armed insurgents, who attempted to overthrow the Government that the people had indorsed at the polls. Their proclamation said:

For some months past all classes of business in Ireland have suffered severely through a feeling of insecurity engendered by reckless and wicked acts which have tarnished Ireland's reputation abroad.

As one disastrous consequence unemployment and distress are prevalent in the country at a time when but for such acts Ireland would have prosperity. The Government is determined that the country shall no longer be held up from the pursuit of its normal life and the re-establishment of its free national institutions.

The patience exercised by the Free State in trying to placate the irreconcilables was futile because they were not dealing with reasonable men. Now the explosion has come, and has been dealt with firmly. It would be rash to predict anything of unhappy and turbulent Ireland, but there is at least better ground than before to trust that order will be established, the liberal Constitution offered the Free State by Great Britain be formally accepted, and representative government put on a sound and permanent basis.

UNION IN THE LAND OF DISUNION

SPECIAL CORRESPONDENCE ON THE SHANGHAI CONFERENCE

BY FRANK T. CARTWRIGHT

SOME of you in the United States of America think much of church union these days. Many more of you talk much and think less on the subject. It is an extremely popular theme of conversation wherever thoughtful men are gathered. But to the man looking in through the window of your magazines and church papers the proportion of talk to accomplishment rather fogs the view; your room full of discussing friends is clouded with the smoke of immaterial things, and the scene is not as edifying as some of you may imagine. American religious life is not undergoing a magical transformation into a unified whole.

Is it conceivable that Brother John Chinaman is going to show America the way toward essential unity? Will he ever be able to lead his Uncle Sam to actual, organic union? Who knows?

Whatever your answer to these questions, leave them and any prepossessions you may have and come with me to Shanghai, China, to sit in the balcony of historic old Town Hall. Look down on the crowded auditorium where sit eleven hundred men and women gathered in the National Christian Conference.

Do they seem a forced conglomeration of warring units? No; they look and talk like the assembly of any one denomination. There are some arguments, occasionally one hears an electrifying speech, but the whole gathering is swept by a oneness of purpose and hope just as forest and field and stream are swept by the winds of God. It is a unified body, yet it is made up of Orientals and Occidentals, the twain which Kipling declared could never meet.

The six hundred Chinese delegates are a striking factor in the crowd, first of all because they are there at all. The first one of these nation-wide, interdenominational Conferences, held within the memory of delegates present at this year's Conference, was made up exclusively of missionaries; the second one, which came several years later, had so few Chinese delegates that they could not be noticed in the crowd; while the Conference of 1913 was only one-third Chinese. This year there are more delegates of the yellow race than of the white. They came from all parts of the land, north and south, even while the armies of the north and of the south were in the field fighting each other. Some are from remote Szechuan, one man having traveled sixty days to reach the Conference seat. Fukinese came in one body, speaking at least five dialects, yet able to understand the national language.

From your vantage-point in the gallery the tops of the foreigners' heads

look much alike—except that there is a variety in the amount and color of hair. Go down to the floor and talk face to face with these "much alike" men, and you will find that they are greatly unlike. You will hear the precise speech of England and the soft tones of America's South. Canada's virility will be noted; Norway's broken English will be heard. If you look quite closely, you will find even a few German delegates. Then when you begin to ask about church relationships you will be fairly smothered mentally, for High Church Episcopalians are there with Congregationalists, Seventh-Day Adventists are beside Presbyterians, Methodists of six different groups are working side by side, Lutherans are with Anglicans, until you find a total of one hundred and seventy electing units representing more than a hundred separate denominations. Yet they are meeting as *one* body, and growing out of their Conference has come a permanent National Christian Council, which is to be their common leader.

This is one result of an almost unanimous desire within the Chinese Church. Again and again in recent years have the Christian leaders decried the divisions in the forces of Christ, and during the days of this Conference (May 2-11) Chinese speakers have on several occasions asked that their Church be delivered from the divisions of the West, which "are largely historical, therefore are neither understood nor desired by the Chinese Christians." The slowly gathering momentum of this demand has led to the almost complete submergence of denominational spirit during the Conference, and some speakers were greeted with hearty applause when they went as far as argument for organic union. It is unquestionable that the pressure of thinking along lines of church unity, thinking which has brought very concrete results in nearly every foreign mission field, is very pronounced here in China.

While thought and talk do not always produce visible results, in the case of this nation the fruit is very evident. In the first place, for several years there has been an organic union of three denominations working in the southern part of Fukien Province. In the same province, as in several others, there are active church federations in which church groups as far apart in polity as Anglicans and Congregationalists are integral parts. Then in the week preceding the National Christian Conference a plan for actual union was laid before representatives of the Presbyterian, Congregational, and Lutheran Churches in China, and the evidence seems to indicate that this merger will

soon be accomplished. During the Conference a smaller meeting of delegates representing the various branches of Methodism was called, and these men established a commission to survey the possibilities of union on the mission field and to recommend a plan to their constituent bodies.

What may prove, in the light of future events, to be the most important movement along this line is the appointment by the eleven hundred delegates of a National Christian Council, a body of one hundred members representing all sections of China and all the major denominational groups, although the idea of denomination is largely buried in the Council. There are more Chinese than foreign members on it, there is an influential *bloc* of women, and there are enough graybeards to furnish wisdom and enough youngsters to keep their elders from settling into a rut. There was no idea of establishing a super-church. In fact, the danger of such a machine was seen and carefully guarded against. No one wanted to see an actual, authoritative council established; at least, no one dared speak openly of such a desire.

But there was an overwhelming sentiment in favor of some national body directly responsible to the electing units and with so much of moral force in its personnel that all the Christians of China would be willing and glad to follow its leadership. For years a body somewhat similar to this has been in existence, the China Continuation Committee, but this was set up by outside agencies and was a self-perpetuating organization, so that even the members of the Committee recognized that a new type of leadership was demanded. In the face of China's chaos there was a recognition of need for a group of men and women who could speak, not for the Y. M. C. A. or the Anglicans or the Methodists, but for the *Chinese Christian Church*, and then could lead that Church into action. It is for this purpose that men have set up the National Christian Council and have authorized it to raise funds, to call executives, to do business on a big scale in the name of Jesus Christ.

China, politically speaking, is in a sad condition of chaos. The Southern armies of Dr. Sun Yat-sen are in the field against the armies of the Peking Government. In the North as I write these words the army of Chang Tso-ling, "the Mukden war lord," are digging their trenches after a first disastrous defeat near Tientsin, and the forces of Wu Pei-fu with the strong division under the Christian general, Feng Yu-hsiang, are preparing for another attack. Armies are in motion in distant Szechuan,

and no one seems to know just what is next on the programme. As a country China is just now rather a hash.

But in that aggregation of fragments there is a unity which you in the West cannot realize. One written language, one set of major customs, one series of three religions, one type of mind, these animate four hundred million people.

Outwardly China is a hodgepodge; inwardly she is very truly one nation. Growing out of that sense of oneness comes an insistent demand for unity in Christianity. It may develop into one Christian Church for all of this country. Perhaps there will grow up a few strong units in one strongly federated whole. If you can prophesy accurately what the

outcome will be, stand up and be numbered among the seventh sons of seventh sons. No one with whom I have talked out here is willing to do more than hazard a guess. But of one thing every one seems absolutely and gladly sure: the movement is forward and the sweep of it is almost irresistible. It will pay you in the homeland to watch it.

THE BRITISH MIDDLE-EAST MANDATES

BY MAJOR-GENERAL SIR GEORGE ASTON, K.C.B.

IN a spirit of altruism, and in order to insure that victors in war should not profit by their victory (thereby removing one of the inducements to warfare), the mandatory system was launched by the framers of the League of Nations Covenant. That Covenant was embodied in the peace treaties with Germany, Austria-Hungary, Bulgaria, and Turkey. The treaty with Turkey never having been ratified, I suppose that, technically speaking, we are still at war with the Turks. Great Britain has accepted mandates for certain territories lost by them in the war—for Mesopotamia (Iraq) and for Palestine. The terms of these mandates have never been approved by the Council of the League of Nations; their further consideration was postponed until July. So far from profiting by our mandates, either in the Middle East or elsewhere, we have been pouring money in millions into the countries concerned ever since the armistice; Iraq and Palestine, taken together, are still costing the British taxpayer about forty-five million dollars a year, even on the assumption that there is no further trouble in those regions. That is the present situation. It is unsatisfactory, but it has to be faced, and the sooner the better. There is a limit even to altruism, and a considerable difference between not making a profit out of winning a war and suffering, of our own accord, additional heavy loss thereby.

We are doing this, be it understood, entirely in the interests of the population of the territories concerned, and, judging by the Egyptian precedent, we should after a space of years leave those people far more prosperous than we found them. But several points require attention. Great Britain, unaided by other Dominions of the British Commonwealth whose representatives signed the treaties establishing the mandatory system, bears the whole cost of these Middle-East mandates. The British people, through their representatives in Parliament, were not consulted when the responsibility was accepted, and there are indications that in these hard times they feel that it is beyond their power to face heavy financial sacrifice either for the sake of the people of Iraq, or for the sake of the inhabitants of Palestine

or Zionist immigrants in that country. Before the League of Nations Council will again consider the terms of the mandates in July many discharged service men will have been thrown upon the labor market by the "economy demobilization," and, even allowing for the improvement in trade expected to result from economizing upon the so-called unproductive services, the unemployment situation bids fair to become serious. Under such conditions, it is clearly everybody's business to study the Middle-East mandates.

The people of Iraq and of Palestine are described in the League Covenant as "having reached a state of development where their existence as independent nations can be provisionally recognized subject to the rendering of administrative advice and assistance by a mandatory until such time as they are able to stand alone," and, further, "the wishes of these communities must be a principal consideration in the selection of a mandatory." The framers of the Covenant laid down the principle that the well-being and development of the people of territories surrendered by our late enemies in war should form a "sacred trust of civilization," and I should be the last to disagree with them, but we are obliged to recognize that we were in a state of moral exaltation in 1918-19, and that, now that it comes to footing a heavy bill for accepting mandates, the mood of many has cooled. The opportunity was lost. When the Versailles draft treaty, embodying the Covenant, was presented in June, 1919, no one imagined that three years would elapse and find the terms of the mandates still unsettled. Much has happened during those three years. The great armies which defeated those of the Central Powers have been demobilized and most of the great ships have been scrapped. There is no longer the same material force behind the ideal of the Covenanters. Nor is there the economic force that was hoped for when America was expected to join the League and to take a leading part.

Prolonged discussion, pernicious propaganda, and other factors have been at work locally, and at the present moment we are in doubt whether the "independent nations" of Iraq and Palestine

wish for any mandatory at all, though, if they must have one, we are given to understand that they would prefer Great Britain to any other country. Then, again, the word "mandatory" is anything but popular. It conveys the idea of predatory rather than of altruistic intention, or, at all events, an idea of dominance. "Why," we can imagine a cultured inhabitant of Iraq or Palestine saying, "should we be bracketed with the savages of New Guinea?" The distinction between class A, B, and C mandates is lost by the use of the general term. Taking the two mandates separately, they confer, in Iraq, the moral responsibility for maintaining internal order and for the defense of frontiers that may quite possibly be threatened with invasion, but they do not now imply the responsibility of the British taxpayer for civil administration beyond the expense of providing a high commissioner and, this year, for some heavy expenditure on repair of railways. In Palestine the question of maintaining internal order again comes in. The situation is complicated by Arab opposition to the Zionist policy of providing a national home for the Jews and by questions arising over the holy places. Against this has been set the alleged advantage to ourselves of greater security to the Suez Canal. Our special interest therein used to be due to the fact that we owned the greater part of the commercial traffic passing by that route. The security of the Suez Canal is of interest to other countries in proportion to their greatly increased share in that traffic. Moreover, to any student of strategy it is obvious that the best defense of the Suez Canal against any threats from the eastward is the desert of Sinai.

With so many conflicting interests at stake, the discussions of the Middle-East mandates in July are likely to be prolonged, and perhaps heated. If the people of Great Britain, who have been, and are, paying the piper, are to have anything to do with calling the time, I believe that their general wish would be to abandon altogether the word "mandate" as applied to "independent nations," and to arrive at the altruistic objects of the League of Nations Covenanters by some more simple method.

THE LAST FIRE

BY HERBERT S. GORMAN

You saw the last fires burning on the hill
In that far autumn twilight when we took
The future by the hand through woods as still
As your heart is to-day, and crossed the brook.

The brook that gurgled through the quietude
Was just a slender stream that sauntered on.
How were we to know the thing we should—
That we had crossed our narrow Rubicon?

And after, in the shadow of the leaves,
When your great eyes grew with the growing night
They left the hollows where the twilight grieves
And mirrored back the bonfire on the height.

And what quick flame was in your eyes I knew;
And how the moment caught us on our way
Is Time's own story written for a few
In dust of ashes in your eyes to-day.

WEDNESDAYS

BY ANNIE B. KERR

WEDNESDAY was always a difficult day for Mary Martinelli to live through, and this one had been unusually hard. She had tried to sustain both body and spirit by thoughts of the gay evening that was before her, but the forelady had been out of sorts and had accused her unjustly of loitering, when, as a matter of fact, she had worked all through the noon hour. The day's work was over at last, and there would be no hated dishes to-night, for her mother had promised to wash them for her.

The dress she was wearing was new, bought especially for this occasion. It was brown satin, elaborately trimmed with shining beads. It had taken two weeks' wages to pay for it. In style it was the very latest, and with a little sigh of satisfaction she surveyed her reflection in the mirror and lovingly smoothed the shimmering folds. The whiteness of her face troubled her; her black hair and dark eyes accentuated her pallor. In her brown eyes there was a little wistful look as she turned away, conscious of the fact that on Wednesday she could never look her best. Hers was a sunny nature, however, and she gave a parting smile to the pale little image in the glass. Then hurriedly dabbing a bit of powder on the end of her nose, she caught up her hat and coat and ran out into the hall.

Avoiding the kitchen, whence issued appetizing odors of her favorite spa-

ghetti and meat-balls, she called good-by to her mother and hurried out into the street.

This was Angelina Salvadore's wedding night, and Angelina was one of her best friends. She was too late for the ceremony, but the reception was being held at the Institute.

She wished it weren't Wednesday night. So many of her friends had parties on Wednesdays, and usually she refused to go. She loved the gayety, the fun, and the dancing too, though that was hard for her with her stiff leg. When it came time for refreshments and it happened to be Wednesday—ah! that was the hard part, and she shrank from the ordeal. Well, of course *they* didn't know the reason, but God knew, and he might have managed better. Perhaps it was his purpose to test her. She had never failed him yet in all these years. What would they serve to-night, she wondered, and how could she ever insist that she wasn't hungry and didn't feel like eating when at that very minute she was faint and trembling from lack of food?

When she reached the Institute, she paused for a moment at the open door and gazed in with an exclamation of delight: "*O quanto è bello!*"

Flowers fairly flooded the room with glorious color—jars of goldenrod, bowls of zinnias and gladioli, vases of asters and cosmos. She did not know the names of these American flowers from

autumn woods and fields and gardens. But their beauty filled her soul with rapturous delight. In memory she was swept back to a happy day in her childhood when she had wandered through a glorious Italian garden on the shore of a blue, blue sea.

A friend's joyous greeting drew her swiftly into the glow of the yellow-tinted walls, relieved by pictures of old cathedrals and bright bits of landscape from far away. Soft curtains of cream-colored silk hung from the long windows. Bright chintz cushioned the wicker furniture. The mellow marble mantelpieces, elaborately carved, held bits of pottery and other lovely things from across the seas. The wicker lamps shed a soft light over rugs and books, all suggesting home and friendship. At one end of the room sat the bride and groom, their backs against the mantelpiece. Just over their heads the formal bouquets of the bride and of her maid of honor stood up stiff and straight—the pink roses and white carnations immovable on their wired stems—a vivid contrast to graceful cosmos and drooping goldenrod. Uncomfortable in his new clothes, the groom sat silent and awkward, ignored serenely by the bride, who greeted the club girls and other friends as she stood up to display her elaborate gown.

Mary was soon surrounded by a little group of friends. Their royal welcome made her quite forget fatigue and

anxiety. All the difficult Wednesdays of the past slipped into the background, and she threw herself heart and soul into the festivities of the evening. Soon the dancing began. The room was filled with whirling couples; not only the young people danced, but the fathers danced with young daughters, mothers with their sons, and even the small children were given their full share of attention and enjoyment. When the music stopped, Mary sank breathlessly into a chair, her cheeks flushed, her eyes sparkling, her feet still keeping time to the echo of the waltz that was ringing in her ears.

Suddenly a wave of faintness swept over her. She remembered that trays of delicious food would be passed continuously throughout the evening. Even as she was thinking the procession started—sandwiches of every description, Italian cakes and bonbons, Jordan almonds, ice-cream, punch, ginger ale, and soda. Steadily Mary refused everything; steadily she resisted the desire to run away home, where she would be out of the way of temptation and where an understanding mother would tuck her into bed. The girls pressed about her, laughing at her abstinence and refusing to take it seriously. She only shook her head, a little forced smile on her lips, all the laughter gone out of her eyes.

Then they began to dance again. Leaning her head wearily against the high back of her chair, she closed her eyes, the dark circles under them suddenly revealed as the color faded from her cheeks. Her body drooped pathetically, but her hands were tensely clasped in her lap. The bright light, the gay flowers, the merry dancers, had faded into the background and she was a little girl in that stricken city of Messina. She recalled the happy Christmas with grandmother and young cousins in the big hotel of which her grandmother was the proprietress; the feasting and games and dancing on that last night before the end came. She remembered how she had crept into bed, a tired, happy little girl, with the remnants of the feast still clasped in her hands, too sleepy to heed the torrents of rain which threatened to break the panes of her window. And then had come chaos—falling walls and floors, frightful pain, hideous cries from other members of the big household. Following those awful first hours were days and nights of terrible thirst and agony before her poor broken body had been discovered and she had been lifted tenderly in the arms of Russian soldiers and carried to the warship in the harbor of Messina. For those few brief minutes she lived over that lifetime of five days and nights as she had done each week in all the succeeding years. But she remembered also, with a little sigh of satisfaction, the year that had followed that awful time. She had been the heroine of the big hospital at Naples. Because her own poor broken fingers were helpless and useless, a real prin-

cess had fed her delicious fruit and held cooling drinks to her feverish lips. But that was thirteen years ago, and she was in America now, that promised land for which her childish heart had so often yearned.

It was Angelina's wedding night. And

Those who believe in
good roads—and those
who ought to—should
watch out for a forth-
coming article

By
NEWTON A. FUESSLE

It's called
Pulling Main Street
Out of the Mud

again the girls were offering her food for which she longed.

"Mary, don't be so silly! Why don't you eat or drink?"

"I don't want anything—honest, I don't."

"You do too. You're as white as a ghost—you look all worn out."

"Oh, come on, Mary, have a sandwich!"

"I don't want anything, I tell you." Her voice broke suddenly and the tears welled up in her eyes.

The girls stood about her in puzzled silence; they could not understand her—she seemed like some stranger instead of their merry playmate whom they knew so well.

"Why won't you have any refreshments, Mary?"

It was one of the Institute ladies who sat down beside her and looked lovingly into her troubled brown eyes.

"I can't, Miss Bradford."

"But why, dear?"

Should she tell? It would be such a relief to have them know—but would they understand? She could not bear it if they laughed at her or thought her queer. Many of them knew of that terrible experience at Messina. They knew she would carry the physical marks to the grave. But could they enter into that spiritual experience which was the most sacred thing in all her life?

"Oh," she said, desperately, "it is because of my vow." Now the girls were crowding around her, even kneeling beside her chair.

"Your vow, Mary?"

"Oh, you see," she said, clasping her hands and speaking in a voice of hushed reverence, "when I was in the earthquake at Messina I made a vow to God. I was so little and so afraid and so lonely, and every day the people were dying all around me. I didn't want to die. I wanted to go to my father and mother in America. And so I prayed to God, and I promised if he would save me I would fast every Wednesday. And you know"—her hushed voice took on an added solemnity—"all the two hundred in that building were taken out dead, but God saved me alive!"

"Why, Mary, that was years ago! Have you fasted every Wednesday in all this time?"

"Every single Wednesday."

"And how long will you keep it up?"

"All my life, of course."

"All your life! Oh, Mary!"

"But it was a promise made to God, and he gave me my life. What is a little food compared to that? I could never, never break my word to God!"

Her face was transfigured with an inner light; her pale cheeks glowed with delicate color, her shining eyes revealed a feast of soul in which her comrades could not share. With startled awe they looked at this new Mary, whose radiance of spirit they felt but could not define, and then turned away to join once more the merry dancers round the bride and groom.

At midnight, when they slipped through the darkened streets homeward, it was not of weddings or dancing or feasting that they were thinking, but of brave, steadfast Mary and the Great Friend who had heard and answered the agonized prayer of a little Italian girl.

SOME OF THE GOOD AND THE BAD IN GANDHIISM

BY R. A. HUME

MK. GANDHI is an idealist of most simple habits, who practices what he preaches. He intensely loves his native land, and is ready to undergo anything for what he believes will be good for his country. He clearly sees some of the injury which has befallen some interests in India through contact with the materialism of the West. He is a deeply religious man, and has been considerably influenced by the teachings of the Lord Jesus Christ. Some of these teachings are refraining from returning evil for evil, and love for all men, even for enemies.

He has an intense hatred of all intoxicating liquors. By ardent advocacy of various temperance efforts, stimulated considerably by political motives, he has, at least temporarily, and I hope permanently, immensely lessened the drinking of such liquors. His special temperance method was getting many persons to stand in front of or very near to liquor shops to deter people from going into those shops. Sometimes these picketers would snatch away and smash bottles of liquor which had been bought.

Mr. Gandhi intensely desires to promote simplicity of life among all sections of his countrymen. One chief item in his programme is to try to get every single family, rich or poor, educated or uneducated, to have a primitive hand spinning-wheel in the home, and every one daily to spend some time in spinning plain cloth! He thinks this would very largely lead to discarding the use of foreign cloth. He urges the disuse of all sorts of foreign articles. He desires what he calls "national education," in which purely Indian methods would be followed.

But there are some bad things about Gandhism. While Mr. Gandhi has influence over men, he has a strangely inadequate understanding of human nature. Absolute and universal abstention from violence is the chief item in his teaching. But he often indulges in very violent language, yet strangely imagines that violent language by voice and in print can be used by himself and his associates without unavoidably resulting in violent actions by many people who do not have self-control.

Till lately there was a very large amount of good feeling and friendly intercourse between most Indians and most Europeans. But Mr. Gandhi's language in gatherings and in the press against what he calls "the Satanic Government" and his extravagant claim that the treatment by very many Europeans of very many Indians is practically treating them as slaves has suddenly created hatred in Indians in the place of much former friendliness.

Another bad element in Mr. Gandhi's influence and activities is the introduc-

कर्मवीर महात्मा मोहनदास करमचंद गांधी.

M. K. GANDHI. Born 1869. महात्मा गांधी.

IT was in response to inquiries from America that Dr. Hume wrote from India the accompanying estimate of the activities of the Nationalist leader, Mohandas Karamchand Gandhi.

Robert Allen Hume, D.D., was born in Bombay, the son of American missionaries. He is a graduate of Yale College. He has been a missionary himself since 1874 and has identified himself with all the interests of his native land.

In a letter accompanying this article Dr. Hume's son, Professor Robert E. Hume, of the Union Theological Seminary, New York City, writes to *The Outlook*: "My father was the only American to be summoned by Mr. Montagu, when he was Secretary of State for India, and Lord Chelmsford, when he was Viceroy of India, to offer testimony and suggestions for the British administration of India. Not only has he been trusted by the English, but he has also been sent to the Indian National Congress as the representative of an India electorate. Accordingly he has been actively and sympathetically engaged in forwarding the progress of India from both sides of the English-Indian relationship."

Inclosed in his letter Professor Hume sent a picture post-card which has been widely used in India. It is a reproduction of a portrait of Mr. Gandhi bearing the inscription reproduced herewith. The first line is in the Sanskrit character, the mother of all the Aryan dialects of modern India. It may be translated as follows: "The efficient champion, the great soul (Mahatma) Mohandas Karamchand Gandhi." And the two words at the right-hand side in the second line are in the Gujarati language, meaning Mahatma Gandhi.

Concerning this Professor Hume writes: "Etymologically 'Mahatma' means 'Great Soul,' and is an epithet occurring several times in the sacred scriptures of Hinduism to designate a 'mighty being' (Chandogya Upanishad, 4.3.6), or a highly honored person (Katha Upanishad, 1.16), or a person regarded as very holy, saintly, perfected (Svetasvatara Upanishad, 6.23). But the preponderant usage in the Upanishads is to designate the Supreme Soul, the Supreme Being, the great Cosmic Soul. There is thus even in the appellation which is now being used for Gandhi an approach, from the line of superb appreciation of his person, to the veneration of him as almost divine. Verily, India is more ready than is America probably to receive an incarnation of adorable deity.

"And verily Gandhi has done something for the promotion of national unity in India that no Christian up to date has done, viz., the bringing together, even temporarily, of two diverse elements—the Mohammedan and the Hindu. But at what cost? The rupturing of East and West more violently than has been done since the Sepoy Mutiny of 1857.

"Gandhi himself, like the whole situation, is most complex. All sides must be brought forth into clear apprehension if the situation is to be saved."

tion and wide use of religious excitement in politics. Almost the chief characteristic of the British administration in India has been absolute abstention from religious partisanship. Ordinarily and naturally, there have been dislike and often strained relations between Mohammedans and Hindus, because polytheism and idolatry are hated by Mohammedans. Religious animosities and riots between Mohammedans and Hindus have been checked and controlled only by the strong arm of the British Government. But because the passing of the British rule is impossible so long as there is religious disharmony between these two principal communities, Mr. Gandhi has brought about a superficial harmony between Mohammedans and Hindus in order to promote their joint action in political activities. A very large number of Indian Mohammedans are disturbed over the injury to Turkey resulting from the Great War. They believe that the Sultan of Turkey is the Caliph or chief religious authority for the Mohammedan religion, much as the Pope is in the Roman Catholic religion; and that without the restoration to the Sultan of most of his former

political power he cannot adequately exercise his religious authority. Hence most Indian Mohammedans wrongly claim that the Sultan's limitation of secular power is practically an attack on the Mohammedan religion; and that because the British Home Government is one of the allies which has limited the territory of the Turkish Empire that Government is considerably responsible for an attack on the Mohammedan religion. Hence the hostility of Indian Mohammedans to the British Government in India and in Britain. And the Hindus, who have absolutely no interest in the Mohammedan religion, have under Mr. Gandhi's influence for purely political motives joined the Mohammedans in claiming that the British Government has attacked the Mohammedan religion. This is very unfair and bad in Gandhism.

Probably the most injurious influence of Gandhism is its rapid and senseless promotion of lawlessness. Theoretically, Mr. Gandhi does his utmost to teach and to promote lawlessness only to the Government. But the spirit of lawlessness to the State unavoidably promotes lawlessness toward parents, teachers, re-

ligious guides, and leaders of every kind. One of the finest elements in all sections of Indian society has always been reverence for parents, teachers, and religious leaders. Multitudes of these elders have recently had their proper and weighty influence undermined and flouted by Mr. Gandhi's appeal to youth to leave schools and colleges connected with Government, whether parents and elders approve or disapprove. The *pax*

Britannica has secured order throughout the land. Gandhism tends to make tenants refuse to pay dues even to private landlords. Lawlessness is the worst injury which an individual, a community, or a nation can suffer. Mr. Gandhi has not proposed or been able to arrange how, after destroying the present Government, if this could be done, orderly society could continue in an empire of three hundred and twenty

millions of people of diverse civilizations and religions, of whom only one male in ten and one female in a hundred can read. This is practically the teaching of Nihilism.

The above is an estimate of only *some* of the characteristics of the political teaching and effort of a remarkable man. In my judgment, a reaction against Gandhism has already set in.

Ahmednagar, India.

THE MIDSUMMER FLOWER PAGEANT

BY EDWARD K. PARKINSON

MAY usually sees the formation of a procession of summer blossoms, but not until the advent of summer do the brilliant, large flowers appear, for the spring flora is always smaller, more delicate, and generally more ephemeral. One must stoop down for the spring flowers; the summer flowers reach up to you. This wonderful pageant, formed in May and augmented in June, moves in stately fashion through July, when wild lilies blaze and tall purple-fringed orchids lift their purple spires; then it moves onward during August over stubbles gay with vervains and willow-herb and meadows fragrant with trumpet-weed. Slowly it files into September along streams flaming with cardinal-flowers and fields gay with goldenrods, until it halts and breaks rank in late October crowned with asters and immortelles. One sometimes wonders if these marvelous summer days are wholly appreciated? All through the winter they are sighed for, and now that they are here let us, by all means, enjoy them.

"It seems," said a well-known garden lover and litterateur writing of the charm of these summer days, "as if nature could not do enough when her appointed time arrives, as if there were no end to her prodigality of bloom and song and color and sunshine—birds singing amid the orchard blossoms, bees plunging into flower cups, meadows smothered with buttercups, swamps golden with marigolds, woods aflame with honeysuckles, fields crimson with clover, bird songs, insect hum, and flower blossoms on every side!" But gardeners, both amateur and professional, are too apt to lose their sense of right perspective; their own little plot of ground becomes too often the whole universe, and they are in great danger of becoming veritable Marthas, troubled over many things. This is all wrong, for, after all, flower gardening should be taken up for pleasure and recreation, and the moment one turns the joy of it into mere drudgery then the whole object of having a garden is gone. A few well-cared-for flowers, a bit of velvety lawn, perhaps a pool, an arbor to rest and take one's ease in, and beyond that what more can one desire in mid-July?

If there should happen to be no pool on the place, by all means concoct one, even if it be only a few kerosene barrels sawed in half and sunk into the ground to their rims, for these, connected by pipes or little stone ditches, make ideal spots for lilies or irises.

As to irises, by the way, a garden without them would not be complete, as they are among the very first large flowers of the garden to appear. To recommend any special variety of them, however, would be superfluous, for they are so numerous and are nearly all so very beautiful; easily grown, thriving in light soil and sunshine, one can rarely have enough of them. If the average gardener would only take the trouble to divide some of these large plants, and thus not only obtain them more abundantly for another year but increase the size of the flowers, he would soon find himself very well supplied with them. The great bearded iris is one of the most effective border plants known, and the cut flowers are also beautiful when arranged with their sword-shaped foliage. The Japanese section of the bed advances in bloom while the bearded iris is in blossom. Naturally a water plant, it should receive abundance of moisture in order to acquire its full development, and whenever possible it should be grown beside some stream or pool.

Another restful plant for the quiet, peaceful garden, and one which requires comparatively little attention except mulching in the autumn, is the peony, including the tree, the herbaceous, and the Chinese varieties, all of which give us one of our most lavish floral displays. Where one cannot grow rhododendrons, these are an excellent substitute in limestone soil, as they are equally floriferous, large-flowered, and varied in coloring. The earliest are the single dark crimson and the double fennel-leaved *Pæonia tennifolia*, the petals of the latter being a vivid scarlet crimson, one of the most distinct reds of the year, its feathery foliage quite unlike that of any of its tribe. Roses are scarcely finer than some of these fragrant Chinese varieties, notably the *Festiva Maxim*, which is pure white in color, marked with a bright carmine in the center; or

the *Marie Calot*, with its pale hydrangea-pink flowers with darker shadings in the center; or the *Madame de Verneville*, which bears beautifully formed flowers with sulphur-white guard petals, and has a compact white center touched with carmine. There is also the *La Tulipe*, which has large globular flesh-pink blossoms shading to ivory white, the center petals being tipped with carmine; this is also a vigorous grower and a very full bloomer.

Among the standard double peonies, *Monsieur Mallet* is effective, being rose-color with salmon shadings in the center; *Anemone flora Rubra*, a dark, rich crimson; *Edulis Superba*, with violet-rose guard petals and a mauve-rose center with lighter edges—these are all worthy a place in the garden. A few of the old-fashioned peonies which come into bloom from ten days to two weeks ahead of the new sorts should include *Mutabilis Alba*, blush-white; *Mutabilis Rosea*, bright rose-pink; and *Rubra*, a brilliant, glowing crimson.

The azalea is another plant which should be more frequently seen in our midsummer gardens; a garden lover, writing of these flowers, says: "I always rejoice when the azalea blooms, for in it I find a charm presented by no other flower. Its soft tints of buff, sulphur, and primrose, its dazzling shades of apricot, salmon, orange, and vermilion, are always a fresh revelation of color. They have no parallel among flowers, and exist only in opals, sunset skies, and the flush of autumn woods. I admit the rhododendron is magnificent where it can be acclimated; but even in England and on the Continent it is exceeded in gorgeousness by the azalea." Thus the ideal garden, where one may indulge in a sense of rest and freedom from hurry and hard labor, should be a simple affair, easily cared for, and beautiful to look upon. *Polonius's* advice to his son, in "Hamlet," might be fitly changed somewhat and applied into a wholesome admonition to the enthusiastic garden lover and builder, thus:

Costly thy plants as thy purse can buy,
But not expressed in fancy; rich, not gaudy;
For the garden oft proclaims the man.

OUR SEACOAST NATIONAL PARK

PICTURES OF MOUNT DESERT AND LAFAYETTE NATIONAL PARK

BY HENRY HOYT MOORE

FOR a generation or more Bar Harbor and Mount Desert Island have been in the front rank of fashionable summer resorts. A new element of popular appeal will now make the island still more attractive to the tourist. This is the setting apart of a section of the island

as a National Park—the only one east of the Mississippi and the only great National Park that fronts on the sea. These photographs, taken both inside and outside of the Park's boundaries, give an idea of the scenery which is readily accessible to visitors to the Lafayette National Park.

AN INLET OF SOMES SOUND

Somes Sound nearly divides Mount Desert Island, penetrating it for about six miles in a northerly direction. It and the adjacent waters were formerly much used by motor boats and yachts. Automobiles have now lessened the travel by water, while greatly increasing the total number of visitors both to the National Park and the various summer resorts of the island

GATHERING LILIES ON "THE BOWL," NEWPORT MOUNTAIN

Many attractive lakes are included within the boundaries of Lafayette National Park, some of them abounding in water-lilies

THUNDER CAVE, MOUNT DESERT ISLAND

These cliffs and others, such as the Otter Cliffs, are on the east side of the island and may be seen to advantage on the "forty-mile drive" around the island. This drive may now easily be taken by automobile in an afternoon, with incidental relaxation at attractive tea-rooms

HER LAST BERTH—AN ABANDONED SCHOONER FINDS A QUIET HAVEN

The long coast-line of Mount Desert affords numerous harbors, in some of which active maritime traffic still goes on. Fish, lumber, and quarried stone are carried largely in schooners. Quarries near the scene pictured above supplied the material used in the piers of the first Brooklyn Bridge

CHEATING THE PARK BENCH

BY ARTHUR CHAPMAN

S

WHAT about the jobless man on the park bench?" is an old question that is being revived with familiar frequency now that the fever of war production and universal employment has spent itself.

The city policeman, with his eternal "Move on," was the one man who seemed to have a direct answer to the question. But Edwin Brown, of Denver—"Lodging House Brown"—has matched the policeman's answer with a better one. Mr. Brown would have the jobless, homeless man move on, but to a municipal emergency home, where he can find good food and a night's rest and a chance to look to-morrow's world in the face in better spirit.

Mr. Brown has been personally responsible for the establishment of many municipal lodging houses throughout the United States. In order to get the experience necessary to rouse the cities to the need of emergency shelters for the jobless, Mr. Brown, who is a man of wealth and education, has lived as a "down-and-outer." He has put on workmen's clothes and mingled with those he has sought to help. He has traveled without funds from one city to another, in order to "get the feel" of life as it appears to the man without a dime. Then he has gone to the press with his observations, and usually a municipal lodging house has been established as a result.

Nor has Mr. Brown been satisfied with the mere establishment of lodging houses for the unemployed. He has "checked up" on such institutions after they have been established. An instance of his methods along this line was shown last fall, when the problem of the unemployed was most acute. Park benches were filled, even on cold nights. Jobless men, many of them war veterans, slept covered with newspapers. Some of them were in Bryant Park, in New York City, huddled about the statue of William Cullen Bryant, the man who wrote: "Truth crushed to earth shall rise again—the eternal years of God are hers."

Yet New York, not so many years ago, built a municipal emergency home, at a cost of \$250,000, for meeting just such conditions. There was plenty of empty space in it, while the benches in Bryant Park were full. There was a weighty conference on unemployment on at Washington, but no word came from that conference which might relieve the immediate necessities of the men on the park benches. Something was the matter; and just the nature of that something was brought to light by Mr. Brown, who came into the city room of a New York newspaper and said:

"I have just been to the New York Municipal Lodging House, and would like to know why it is that with between eight hundred and a thousand

beds there and the parks filled nights with men who are out of work, less than half the beds are occupied. When I asked the lodging-house keeper for the reason, he said: "This place is chiefly for men who vote here. We only permit non-residents to remain one night."

The city editor detailed a reporter, who first interviewed some of the men on the park benches. The reporter found from these men that they would rather sleep in parks, hallways, or anywhere else than apply at the New York Municipal Lodging House.

Then the reporter put on an old suit of clothes and applied at the lodging house, where he found conditions bad. He reported that the inmates were so concentrated on the floors, despite the great floor space and bed capacity, that their health was endangered. The supper, according to the reporter's account, was bad, and the breakfast was worse. The ventilation was so poor that one man begged to be allowed to leave, only to be told to go back to his blanket on the floor or be put in jail. To pay for such quarters and such food the inmates had to work about the lodging house for two hours, or longer at Blackwell's or Randall's Island, thus depriving them of a chance to get jobs during the best time in the morning.

Yet it was only a few years ago that Mr. Brown was citing the New York Municipal Lodging House as something for other cities to copy. He had found there kindness and cleanliness. To-day, in a time of greater public need, he finds the same institution cursed by unemployed men, who would rather shiver in the parks than go near it. So much for the lost motion that comes through political mismanagement.

The same condition obtains pretty generally throughout the country, Mr. Brown has found in the process of checking up on the lodging houses that have been established by municipalities. During war-time prosperity there was little use for such lodging houses. Some were even converted to other uses, apparently on the idea that universal employment was going to last forever. Most of the cities maintained their lodging houses, but permitted them to run down. The position of lodging-house keeper became a sinecure, to be handed out to some political favorite.

When unemployment began to be a problem in Boston, former Mayor Peters, of that city, put on a ragged suit of clothes and undertook the same sort of an investigation which Mr. Brown started in New York. He visited the Boston Municipal Lodging House incognito and had supper, lodging, and breakfast there. Then he sawed wood for an hour in the morning to pay for his entertainment. As a result of his experiences he asked

for \$50,000 to make needed changes in the emergency home.

The Boston Mayor's visit to the Municipal Lodging House was the result of reading "Broke," a book in which Mr. Brown has set forth his impressions of several years of mingling with the unemployed—a book which from the standpoint of actual observation alone ranks with the studies of Wyckoff, Flynt, London, and others, with the added merit of a constructive purpose.

A youth who accosted Mr. Brown one February night in Denver several years ago was indirectly responsible for the establishment of many lodging houses. Also he was responsible for the investigations which have gained Mr. Brown the newspaper sobriquet of the "Millionaire Tramp."

Mr. Brown learned that this youth was sleeping at a brick kiln on the outskirts of the city. The next night Mr. Brown put on an old suit of clothes and tramped out to the kiln. It was about midnight, and the brick had been withdrawn. In the hot kiln were a dozen men, sleeping the sleep of exhaustion. Mr. Brown caught such snatches of sleep as he could, but frequently had to go to the opening of the kiln and get a breath of fresh air. About three o'clock in the morning, at the very coldest time, the men were awakened and informed that the workmen would have to fill the kiln with brick for the day's baking. Mr. Brown tumbled out into the cold with the rest. All were reeking with perspiration, and undoubtedly some of them contracted pneumonia and went to fill the overcrowded hospitals of the city and county. Since that night it has been one of Mr. Brown's chief contentions that municipal emergency homes, providing needy persons with shelter, are a good investment for a city from a financial point of view, as they save a heavy drain on hospitals and other institutions.

Mr. Brown entered immediately upon his crusade, which took him to New York, Boston, Chicago, Pittsburgh, Philadelphia, Washington, Salt Lake, and other cities. Usually he dressed in some such garb as he wore that first night at the Denver brick yards—a well-worn suit, with overalls added perhaps, a blue shirt, a cheap handkerchief, and a disreputable looking hat. Sometimes he went from the best hotels in such clothes, and barely escaped being ejected by indignant bell-boys and doormen. At other times he would make long journeys from town to town without funds, living with "migratory labor" on the road and learning just what that type of laborer thinks of life.

In the course of his investigations Mr. Brown had countless disagreeable experiences and some which nearly cost him his life. He slept on the Denver and

Rio Grande Railroad ash-heaps at Pueblo, Colorado, just after several unfortunates who had crawled there for warmth had been suffocated by gaseous fumes. He was thrown into bull-pens and vermin-infested jails. Sometimes he spent his nights voluntarily in such jails, with men who were forced to that disagreeable necessity rather than go through the alternative of freezing to death. One cold night in Salt Lake he sought shelter in a box car with some delicate youths who were trying to find employment in the West. The car was so cold that finally Mr. Brown was compelled to give up and seek his hotel, but not until the supposed down-and-outer had given his companions the price of lodgings elsewhere.

One of his most trying experiences occurred at Pittsburgh, where he was turned down by one charitable organization after another because he did not have a quarter for a bed and was sent away from a mission because he did not have ten cents. Finally Mr. Brown went to a park in Allegheny City, paying his last cent to get across the bridge. But at nightfall the police drove him out of the park. He turned back toward Pittsburgh and was followed by two hold-up men. He saw the gleam of a revolver as they approached him, but they turned back finally, one of the men remarking, "I told you it was nothing but a hobo." Mr. Brown walked across a railway trestle as his only means of getting back to Pittsburgh, and nearly lost his life, as he slipped and narrowly escaped falling into the stream. In Pittsburgh he was promptly "run in" by a policeman, and spent the night in the city jail, amid indescribable conditions.

The New York Municipal Lodging House as it was conducted immediately after its founding is referred to by Mr. Brown as a good example of what such an institution should be.

"I shall never forget one night I went there, disguised as a down-and-outer," he said. "I went from the Waldorf Astoria, where I had donned my disguise, and when I told an officer I was penniless and hungry—which was true, as I did not have a cent with me and had not eaten for a considerable time—I was not treated as a felon, but had the Municipal Lodging House pointed out to me. First I was given a good meal—not a few scraps, but a first-class, well-cooked meal, of the kind that puts a man at peace with all the world. Then came a shower-bath, and as I stepped into it the attendant put a germicide on my head and good-naturedly and picturesquely described its purpose as he did so. I was given a clean nightgown and climbed into a clean, warm bed. Next to me was a poor, feeble wanderer, probably seventy years old. As he crawled into the bed—perhaps the first comfortable bed he had reposed in for years—I heard him sigh, devoutly: 'God, I thanks thee!'"

"Nor are the benefits of a municipal lodging house all for men. I saw a woman and seven children come to the

(C) Harris & Ewing

EDWIN BROWN, WEALTHY PHILANTHROPIST OF DENVER, WHOSE PERSONAL INVESTIGATIONS INTO THE CONDITION OF THE JOBLESS HAVE RESULTED IN THE ESTABLISHMENT OF MANY MUNICIPAL LODGING HOUSES

New York Municipal Lodging House one night—driven to the street by a drunken husband and father. Also I saw a young girl hesitate before ringing the lodging house bell. The Tenderloin was to the west and the dark river to the east. As she stood on the steps in indecision, the door opened and she was gathered into motherly arms."

Mr. Brown's method of establishing municipal lodging houses was through publicity. He would visit a town that seemed to be in need of such an institution and, putting on his disguise as a down-and-outer, would visit the various charitable institutions in search of lodgings. Almost without exception, he says, he has been turned down by such institutions.

"While organized charity has its place in dealing with families," said Mr. Brown, "it seems to have no place in its scheme for the individual who is totally without means or shelter and who needs immediate help. It is no use asking such men for a dime or a quarter for a bed. One might just as well ask for a dollar."

Generally Mr. Brown's quest led to his arrest as a vagrant and a night in the bull-pen. On his release he would visit the local newspaper and tell his story, and the city administration generally

would "get busy" to remedy conditions on finding public sentiment aroused. One municipal lodging house after another was started through such personal efforts on Mr. Brown's part.

Mr. Brown has found, he says, that municipal lodging houses are proving to be a National asset in these days of industrial reconstruction when non-employment, especially among the unskilled classes, has again come to the fore.

"While unemployment conferences are being held," Mr. Brown says, "the unemployed man cannot wait for aid. War workers were able to save little from their high wages, because the cost of living advanced proportionately. The man out of work needs something for his immediate necessities, which a well-conducted emergency home supplies. A poorly conducted lodging house is worse than none at all.

"I do not hesitate to declare that ninety per cent of the unfortunates I have met would work if they had the opportunity. But these men, who have no place to turn, sleep in places where they contract illness from exposure. Then they crowd into the hospitals that are conducted at public expense. Many of these men drift into crime through their desperate condition. A man is hardly to be blamed for doing something desperate when he is cold, hungry, and miserable. It reminds me of what I heard a youth say at the municipal lodging house in Boston, where we were given miserable beds and where we could not eat the stuff that was given us at breakfast. The boy pushed the stuff away in disgust, saying, 'Oh, I'm going out and win a breakfast on the street.' Which meant that he was ready for something desperate that might bring him the price of a meal."

Mr. Brown is slight of frame, but his keen blue eyes tell of unusual determination. Sometimes, when carrying on investigations in big cities, he has been unable to stir out of his hotel for days, owing to the unnerving sights he has witnessed when he has been herded into some bull-pen with men who have committed no crimes. He nearly lost his life a few years ago while investigating working conditions among the sheep camps in the Far West. In throwing a heavy sheep into a dipping vat he sustained an injury which threatened to prove fatal. But as soon as he was able to stir about he began an investigation of conditions in sanatoria for the tubercular in the Rocky Mountain region. He secured employment in these institutions as a potato peeler or in any other humble capacity. As a result of his investigations he published a "white list," showing the institutions where patients received more than perfunctory care.

But lodging houses have been and still are his hobby, and when one of these municipal institutions is started it will be found generally that "Lodging House Brown" has had something, directly or indirectly, to do with it.

BANKER-FARMER CO-OPERATION

BY MAURICE A. HAWN

"WHAT has the banker actually done for the farmer? Isn't he really holding out on the farmer?"

These are almost the exact words of a farmer in a recent farmer-banker meeting in southern Illinois. For a few seconds every one present was too surprised to speak. The farmer's question was a bolt out of a clear sky.

The meeting had been called by the local Chamber of Commerce in the hope of establishing a better understanding between farmers and bankers. The President and the former President of the State Bankers' Association had spoken at some length on the War Finance Corporation and the Federal Reserve System and had explained the banker's limitations in obtaining funds for the farmers.

The farmer's query started questions. Coming pointedly and right on the heels of speeches breathing an air of co-operation, it brought the two sides almost at bay. But even to the farmers present, with the exception of the one who asked the question and perhaps one or two more, the skepticism as to the banker's helpfulness seemed a bit too strong. To the bankers it smacked of suspicion and hostility.

But a banker did not arise to reply.

A farmer answered.

"Well," came from a corner of the room, "I'm a farmer myself. But if I had to pick out the man who's helped me most I'd pick my banker. He's stood by me even more than, I expect, he should have done."

Other statements eulogizing the banker came steadily in for a few minutes.

But the farmer who had asked for examples of the banker's co-operation was not alone. Other farmers arose during the course of an hour's discussion. And, while they did not express themselves quite so bluntly, they gave out unmistakably the impression that they did not feel that everything possible was being done for them by the banker. The meeting showed simply that in that group of perhaps fifty farmers there were five who were inclined to deprecate the banker's assistance to the farmer and who were obviously suspicious of any advances by anybody to improve relations between the two.

Of the different meetings which are held for bettering relations between manufacturer and farmer or farmer and banker, some are successful. Others are like the one just described, where the dominant impression of each group on leaving is the need for co-operation. Still others take on a less encouraging look because there are men present who cause friction. And, since these radicals

are spokes, even though warped ones, in the wheel of agriculture, finance, or industry, they have been permitted to have their say. They are suppressed as much as conditions will permit. But when they do break out it is natural that their remarks should create an incorrect idea of the farmer.

The writer was present at a second farmer-banker meeting in which misinformed members caused even more misunderstanding among the two groups.

After a talk on courageous activity in the present depression, a talk dealing with the proved value of optimism to finance and industry and the possibilities it holds for farmers, a young farmer arose.

"We've just listened," he said, "to a talk on optimism, which is nothing more nor less than soft soap. Salves over our feelings and gets us nowhere. I don't see, myself, any particular cause for feeling encouraged."

"Other parts of the Nation have not been hit like we have. We farmers bought things at an extremely high price. We bought heavily, too. For many of the things we are still paying. But we are paying in products worth nowhere near what they were when we contracted to buy the articles."

"In other words, deflation has hit us farmers harder than any one else. It is a serious blow, too."

"And who started it? Not the farmers! Wall Street started this period of depression for its own benefit. It had bought in immense amounts when money was worth very little. Now Wall Street has been largely instrumental in the calling in of billions of dollars, thereby increasing the value of the dollars outstanding."

"Payments to Wall Street in the dollar of to-day mean much more than payments in the dollars of the date of the sale."

"It looks to me like the only way to solve the situation is to follow Germany or some similar country's example. Issue enough money to restore former conditions. Follow out Edison's and Ford's plan. Wall Street and the banks generally have crabbed things. Let's issue enough money to put us back on our feet. Let's queer Wall Street's game."

"The gold standard is a big farce, anyway."

"In closing, I want to say that the only way we farmers are going to get anywhere is by helping ourselves in some such method as the one I mentioned."

A noticeable tittering spread over the room when the young farmer sat down. His idea on the gold standard apparently amused the audience more than anything else. But the speech was

spoken. It stuck in the minds of some of those present because the speaker displayed a bit more knowledge than they had about some phases of the economic situation. In other words, the speaker had just enough information to be dangerous to the meeting. His ideas weren't forgotten immediately. This could be seen from the fact that several of the less prosperous-looking farmers could be heard from time to time talking about the "paper-money" idea.

To those almost completely ignorant of economic matters nothing is more eagerly gobbled up than a plan for remedying our business ills through practically unrestricted printing of money. Several times already has this proved disastrous. But the idea pleases many.

Strange to say, even now some reports advise that Europe is prospering far beyond America. And, stranger yet, there are those who believe them. They point to the "success" of the money systems of such countries as Germany, Poland, and Russia. They do not know that the amounts of money printed in these countries are so hopelessly, inconceivably immense that they will never be redeemed; that the amounts printed by these countries alone run up into the trillions.

While it has been heretofore conceded that education is a very desirable thing for the progress of the country, it is now evident that greater education in some circles is an absolute necessity to business recuperation. And no better education could be given the different groups than an intimate insight into the problems of each other. Plans are afoot for something of this nature between the banker and the farmer. It will be a godsend.

The vital need of a better appreciation by each group of the other's conditions is emphasized by the occurrence in the second farmer-banker meeting just described. Such an appreciation would here have saved friction and antagonism born of a woefully incomplete and distorted idea of economic conditions.

Our different enterprises are so entirely essential to each other that one may well feel relieved and encouraged when he perceives how each branch is trying to learn more of the other and of the relation between itself and that other. If radicals can be suppressed until they are just a bit more educated far greater progress will be made.

In a period of depression recovery may be expected in almost direct proportion to the willingness of industry, finance, and agriculture to solve problems with a view to the greatest good to the greatest number rather than particular good to some particular group.

A RIGHT SHERIFF

BY LUCY FURMAN

IF the Kentucky mountains could be looked down upon from an airplane, they would have the appearance of the convolutions of a coral. The ridges, not high, but so steep that the effect of height is produced, twist, turn, double, and wind until they form a maze through which no stranger could hope to find his way. There is practically no level land anywhere, except narrow strips of bottom along the larger creeks. The roads are usually in the creek beds or just alongside.

A more ideal country for moonshining could not be imagined. Though corn-fields often extend half-way up the steep mountain-sides, the upper part of the ridges is always timbered, and at their very summit are usually the "high rocks," with their fissures, grottoes, and other hiding-places. Also horizontally through all the ridges run coal veins—any man can climb varying distances into his corn-field and open him up a "coal bank," digging out all the family needs with his pick—and an old coal bank makes a fine place for a still.

For more than a century the people of the mountains have been accustomed to still their own "corn liquor," just as they have made their own cider or brandy. The excise laws they have looked upon as unjust and extortionate. They have said that a man has a perfect right to use the corn he raises in any way he sees fit, and that it is no business of the Government's. County officers, even in counties that were nominally "dry," have seldom undertaken any enforcement of liquor laws. Circuit judges have sometimes imposed fines upon the sellers of liquor, when they could be caught. A few years ago it was no uncommon sight to see "rat-houses"—small log structures seven or eight feet square, with a tiny window or hole toward the road. Through this hole a buyer would pass his jug or bottle and his money. A hand from the inner darkness would receive both, and shortly the jug would be passed out again, filled. As only the hand of the "rat" was ever seen by the buyer, he would never be able to swear who had sold him the liquor, and sellers were seldom convicted. As to the moonshiners, or stillers, who made the liquor, the hunting of them was left entirely to Federal revenue officers, who came in only at rare intervals, with small knowledge of the country; and of their coming the moonshiners were sometimes forewarned by the very sheriffs themselves, so that their raids accomplished little.

About forty years ago the corners of three counties, remote from the county seats and particularly noted for their lawlessness, were cut off and made into the county of Knott. For years the

new county continued to live up to its reputation—there was a feud or "war" of eighteen years' duration, there were numerous killings (a "killing" is never a "murder" in the mountains), and every "citizen" was more or less a law unto himself. Though in the past twenty years there have been fewer homicides and felonies, moonshining has gone on unchecked, and this in spite of the fact that the county has been for years nominally "dry."

When Andrew Combs, of Hindman, the county seat of three hundred people on the forks of Troublesome Creek, took office as Sheriff of Knott County in January, 1918, it was with the determination that the laws should be enforced. Andrew is a fine, strong, silent man, whose every feature bespeaks will power, force, grim courage. He said nothing, made no promises, but went quietly to work.

The results of his four years in office and the varying ways in which they are regarded may be gathered from two remarks, one repeatedly made by mountain wives and mothers to the women of the Hindman Settlement School, which has been for twenty years established in the county: "I tell you, women, we have got a right sheriff now! He's a-breaking up stills, and tarrifying the stillers, and saving our boys for us!" and a second, voiced by a venerable citizen, who, shaking his white beard with vehemence, declared: "Eh law, this fifty-dollar-a-still bounty is the pure ruin of the county, making men turn traitor again' their own flesh and blood and hunt 'em down like varmints!"

Even in the old days, when "corn liquor" was only a dollar or two dollars a gallon, stilling was profitable. When war times, the passing of the Eighteenth Amendment, and the building up of numerous mining towns within marketable distance sent the price soaring to forty and sixty dollars a gallon, the increase of the business may be imagined.

In the first place, a description of a mountain still may be of interest. A safe spot is found, usually high in a wooded hollow, sometimes behind a fallen rock, or in a sink-hole or an old coal bank, but always alongside a little stream of water. Then the furnace, a round affair made in the shape of the metal still which is set within it, but a little larger, is built of flat rocks cemented together with mud. At the bottom of it, and just over the fire, is a large flat rock, covered thickly with moss or clay, so that the bottom of the still will not be heated, but the flames will pass up and around the sides of the vessel, making an intense heat. The top of the furnace is closed over with stones, except for one small hole through which

the smoke escapes. The still itself usually holds from forty to a hundred gallons, and may be made of two metal wash-tubs bradded together, or of a metal oil tank or barrel, but is often made of copper sheeting, shaped and bradded by hand. In the top, over a hole twelve inches in diameter, is a metal arm or "snout," tapering off to a small size and connecting with the coil of copper pipe which constitutes the "worm." This worm rests in a barrel or "flake-stand" alongside the still, and through this barrel cold running water, conducted from a stream above, continually flows. The still itself and the worm, being precious, are always lifted out of furnace and flake-stand when not in actual use and securely hidden away.

Half a dozen or more oil or flour barrels have been procured and stand near, ready for the "mash." Also the "malt corn" has been prepared by sprouting, say, a bushel of ordinary corn in a wet, warm place, then drying it, sprouts and all, and then grinding in a sausage mill, after which it may be kept indefinitely.

The moonshiner takes the corn from his crib in his wooden sled, drawn by a mule or a couple of steers, and goes to mill (there are numerous log water-mills scattered along the creeks), returning with so many "pokes" of meal. The still is set in the furnace and a quantity of water heated. Then about a bushel and a quarter of meal is put into the bottom of each barrel, and enough warm water poured into it to make a "dough." This is well stirred, until equally heated, and then a layer of malt is spread over it an inch or two thick. This "dough" stands for twenty-four hours, when it is broken and stirred up, malt and meal together, and enough warm water poured in to fill up the barrel. This remains about six days, fermenting, and is called the "beer" or "mash," and is very sour.

When the six days are ended, the still is again brought up and set in the furnace and well domed over with rock, and the worm is also brought from its hiding-place and set in its barrel, armed guards keep lookout, and the real business of "stilling" begins. The beer is poured into the still, a barrelful at a time, and an intensely hot fire is built under it. As it boils the steam escapes up through the metal snout and into the worm, passing through the cold coils, in which it is distilled, running out into a bucket or other receptacle alongside the barrel. To "run off" a stillful usually takes about two hours, and six barrels of "beer" would take twelve hours. No stop is made until all the beer is thus boiled and run off. This is the time of greatest danger to the stillers, when the most vigilant watch must be kept. Often

ANDREW (AT RIGHT) AND A DEPUTY, WITH STILL

it is done at night, so that the smoke will not be seen. Thence has come the name "moonshining."

The fluid obtained from this first distillation is called the "singlings," of which there will be about fifty gallons from six barrels of "beer." The singlings is not fit for use, being too weak. It is then put back into the still and boiled in the same way and redistilled, emerging this time very strong, the first "shots" being almost pure alcohol and like fire to the tongue, and far too strong to drink. But it becomes weaker all the time; and either the strong and weak are mixed together or the strong is diluted with water, to make it drinkable.

A very recent innovation is the "thumping keg," an ingenious arrangement placed between the still and the worm, which shortens the process of distillation about one-half.

Like all truly brave men, Andrew Combs is extremely modest and silent, and it was a most difficult thing to get him to talk about the experiences of his four years in office.

"I have never hunted stillers by riding along the creeks and main roads," he said; "they always have watchers out, and then, too, whenever a moonshiner finds you are in his neighborhood he will carry the news to every other moonshiner before you can possibly get there.

"Usually I would slip out of my home after midnight and would ride while it was dark, and then before day take to the ridges, afoot—I and whatever deputy or deputies happened to be with me.

We would then scatter out in the timber, in any place where we had reason to think there was a still, and come in on the stillers from different sides.

"One time I and my brother got one located right below the mouth of Big Branch of Ball. At the mouth of Clear Creek we took to the ridges and came out on Big Branch. The still was in a hollow that sloped down from the top of the ridge to a big rock. Just below this big rock, in a deep hole, it was set up. We saw them just building the fire under the furnace. One man was out with a double-barreled shotgun, finger on trigger, watching the road down below, never thinking of any one coming down on him from the ridges. We watched for two hours, hoping to get the drop on him; but he would not turn his gun loose a minute. The other fellow had a gun, too; though he was tending the fire, he always kept his gun in one hand. I slipped along down and got behind a tree near the still, and at last the man who was tending the fire came up about half-way to me, set his gun against a tree, and turned back again to the fire, when I stepped out, picked up his gun and arrested him. Then my brother came down, and I handed him this gun and told him to stay by the still, and I would try to get the other fellow, who had just gone around past the big rock on his beat watching the road. I took after him and ran him a long way, but he finally escaped.

"Often when I and my deputies would get wind of a still one of us would slip to the place and see what stage of the

game it was in. By examining the barrels of mash we could tell almost to the hour when they would be ready to run it off, and then we could be on hand and take, not only the still, but the men too.

"One time I heard there was a big still on Mallet Branch of Carr. We went up and crossed the gap in the mountain, and there left our nags and took to the ridge. On the far side was a cleared field, and we could see a big bunch of men down in the head of the hollow. We made a circuit and finally slipped down and got within ten steps of that still and stayed there for fifteen minutes, listening. There were thirteen men and some boys, all sitting there working at the still and talking, and all pretty drunk. Suddenly I spoke, turned my gun on them, searched them all for guns, arrested them, and chopped the still up and set fire to everything I could. I saw one of the old men trying to motion to a young man who was coming up the hill with a lot of fruit-jars, but he failed to see the warning. When he arrived, I said to him, 'Are you bringing us some dinner?' He said, 'No, I brought these to put my liquor in.' Then, in a flash, he saw who I was, and was sorry he had spoken.

"Occasionally a still will be quite near a house. One I recall was not a hundred yards from the house. A little pen was built around it; it might have been a hog-pen. Although I had reason to think there was a still on this place, I had no idea it was down by the house, and walked right into it. When I was almost up against it, one of the boys

A MOONSHINE STILL IN OPERATION

popped his head above the pen, and I turned my gun on him. Then the other raised up, and I got him too. About three gallons of liquor were already run off, and a good stream was still running. While I was cutting up things the third brother walked in, and was taken.

"Another time I was going up a hill where I had noticed a slick trail from the house to a hollow above, and right in the path met a moonshiner carrying the still on his shoulders. He was all bent over under it, and could not see me, and was an astonished man when I arrested him.

"The most perfect still place I ever saw was right out in the middle of a steep, open field, where an old coal bank had been. The man had dug out the entrance, deepening and widening it a lot, until he had a place in there about eight by sixteen feet. Then he had covered it over with slanting boards, and thrown dirt back all over them, leaving just a crack or two for light. When you looked over the field, you saw absolutely nothing. The only way I discovered it was that he had a pipe buried, through which the slop was run off, emptying out quite a distance down the hill, and I happened to notice the white-looking sediment there on the ground. The man is in Federal prison now.

"Another time I saw smoke on top of

a ridge over beyond Hollybush, and went up to investigate. There, right on top of the ridge, in a grape-viney patch where a small stream of water came out of some big rocks, was a still, with the men working at it. It was a very dry time, and the leaves on the ground crackled so I found it difficult to slip up on them, hiding behind trees as I came. But I managed to get within a few feet, behind a rock, where I could hear their whole conversation and watch them work with the still, filling it up with beer, etc. One of the men was a very good old man, Uncle Jimmy —, sixty-six years old. He was terribly downfallen when I stepped out and arrested him. He said: 'You don't need to search any of us for weapons, for we hain't got any; we didn't come here to fight.' He said to one of his boys, 'Joe, I wisht you never had found that spring there.' He was such a nice, peaceable old man I hated bad to have to take him to jail.

"But they are not usually peaceable like that. One time we heard a man was running a still, and found it right in his house, where he had hidden it for safe-keeping. He himself was up in the field hoeing corn, and we waited below until he came down to dinner, and then surrounded the house. He saw us when he was almost there, and jumped out over

the palings and a high bank, barefooted, and went right into the brush. We got his two brothers when they came in, however. The first man got him a pistol and followed us when we left, and when we came out from getting our dinner at the house of one of my deputies, Green Gayheart, near by, he started in firing at us from above. He fired five or six bullets at us, and barely missed me. Finally I located the blaze of his pistol, and almost hit him, but he got away. Then he went off and got a high-power rifle and came back to Green's and laid for him. Green was starting out, and went to the little branch by his house to wash the mud off his shoes, and was stooping over, with one foot on a little pole in the branch, when a steel ball hit right between his feet and nearly knocked him down. Then as Green went into the house he shot at him again, just missing him. Several times since the men of this family have ambushed us, hiding behind logs or rocks, and one time they certainly would have killed Green if one of his boys had not discovered their hiding-place and turned him back.

"On the same creek, which is a very bad one for moonshining, another of my deputies was killed last summer, Lawrence Conley. A noted desperado did the shooting, but was paid two hundred

dollars to do so by two men, 'moonshine kings,' who were concerned in a lot of stills.

"Sometimes there is a real battle. We had broken up a still on Buck Lick Branch of Ball early one morning, after riding most of the night. While the still things were burning I saw a small boy running in the valley below, and knew he was taking the word to somebody, but did not know who. We continued along the ridge and came out at the head of a fork of Buckhorn, and heard a noise down in the hollow and a man saying, 'They are sure coming!' Looking over a big cliff, I could see a crowd of men right down under me, all arming and getting ready—there were thirty or forty—and just below them was a big still in the branch. I heard one of them, Old George —, say, 'Here's the place to get them,' and he climbed up on a jutting rock, or small cliff, with his gun. My deputies came in sight about that time, on the ridge, and all hands went to shooting. Old George jumped right off of his rock, twenty feet high, and the others dropped down behind logs. I ran down, found Old George crawling around below the rock with blood all over his hands, took his gun, and then stayed on his rock shooting and trying to hold the men all down about the still so they could not get away. Our boys kept right on down the hill, while I stood on the rock guarding them. There was a real battle, with lots of shooting on both sides. Finally I went down myself, hoping that we could round them up and take them all. But one of them slipped around and got on the rock where I had been and began shooting into us, and the first thing to do was to put him out of business; and while I was attending to him the others got away, except old George.

"While we were destroying the still the wife of the man whose land it was on (she was a sister-in-law of one of the deputies) rushed out on us and said, 'You just can't destroy our still—I hain't going to stand for it!' and talked and hollered and tore her hair and did everything she could think of. She said to her brother-in-law, 'If you stick an ax in it, I will bust your head!' He said, 'All right, go ahead.' He came down on it with the ax, and she picked up a big rock and flung it at him. It just missed. She kept right on rocking him and us 'until the still was all destroyed.

"Right often we have lively times with the women. One woman down on Beaver, where we found a still, prayed and cursed and went on at a great rate, trying to claim they didn't know about it being there. But I told her it was no use, that I saw that the rived boards they had over the beer barrels were exactly like those she had on her chicken-house and warm-bed.

"Another time when we had found a still over on Jones's Fork of Beaver, right in the middle of a man's field, I

had no ax to cut it up with, and said to my deputy, 'I will go down to the house and get one.' Before I left I noticed some fresh hog meat up at the still that the men had been eating when they saw us coming and ran. I went down and stepped into the kitchen, and there sat three women, one of them cleaning hog's feet with a big butcher knife, and there was plenty of other fresh hog's meat around. I asked for an ax. The woman said nothing at first. Then she said, 'It looks like if you are in that business you would fetch your own ax.' I told her it was too much trouble to carry. Then I walked out in the yard and picked up an ax I saw lying there. She got up, knife in hand, and said, 'You shan't take my ax.' She charged right down on me with the butcher knife. I paid no attention to her, but went right on up and cut up the still. While we were in the midst of it her man began to shoot at us from high up in the timber. He shot some fifteen or twenty times. The bullets were just singing around us, but fortunately they were a little high to get us.

"But the nearest call we ever had was one night at the end of a three-day raid, during which we had destroyed ten stills altogether, with 5,885 gallons of beer and 267 gallons of whisky. Three of these, on Middle Fork of Quicksand, were under one large roof, about twenty feet square, made of boards rived from a big oak log that lay on the ground near by. One of these stills was made from an oil tank, one from a metal oil barrel, and one from a metal cracker barrel. There were also three worms and three flake-stands, and there were 2,680 gallons of beer, contained in eighteen oil barrels, one hoghead, and four large boxes. Two of these stills had big fires under them, the third was just in the mash stage. Just as we reached this still they began to shoot down on us from a spur just up the branch, and a bullet hit the leaves just above my head. We scattered out and ran up and tried to catch them, but they got away in the timber. Then we cut and burnt up everything, and the roof being very dry, it made a grand fire.

"After destroying several other stills on Shepherd's Branch of Quicksand, we came the third day by the head of Salt Lick across the mountain to Bee Tree Branch of Licking, where we cut up another, then to Trace Fork of Licking, where we cut up two more. Night came on, and we tried to find a place to stay all night, but everybody around there was moonshining, and nobody would take us in. Finally we rode up to a widow woman's who had a big barn and a big house. She said she had no room for us, but we told her if she would let us stay in her barn in the hay we would be thankful for that. The barn was about a hundred yards from the house, on the road, down next to the creek. We put up and fed our horses and then went into the house for supper—the

woman had said she would get us a little—each man eating with his gun beside him. While we were eating a man came to the gate and called the old woman out to the fence, and would not even talk to her there, but made her go down the road with him about twenty paces. We did not like the looks of this very much.

"After eating we went to the barn, which was nearly full of hay, hung up our lanterns in three different places, made us nests in the hay, and lay down and went to sleep, six of us in a row. About the time we dozed off a thirty-two pistol bullet cracked, and in just a thought the bullets were coming in on us from three or four different places on the hill above—bullets from high-power rifles, 45 automatics, 32 automatics, 45 Colts, shotguns, and others; we found shells the next morning from eight different kinds of guns. The high-power bullets cut a plank in two within six inches of a deputy's head. Splinters were flying, bullets were whizzing and whistling as thick as hail through the loft and above our heads. I have never understood how any of us escaped alive.

"As soon as I made sure all the boys were awake, I grabbed my gun—all our guns were in one corner together—blew out the lantern which was hanging nearest over us, jumped down from the loft, ran outside, and began locating the men by the flash of their guns. As soon as I would locate one bunch, I would let them have my fire. By this time the boys had all gotten down out of the loft with their guns and blown out the other lanterns, and then we all got out in the corn-field and tried to locate them if they shot any more. After waiting there for some little time, I had the boys light the lanterns again, hoping that would draw their fire; but they were done. Finally we climbed back in the hay again and went to sleep, and had a good rest. When we went in to breakfast next morning, I remarked to a young man who sat at the table that somebody had been drunk and trying to shoot around in the road last night. We went up before leaving, and found signs where a number of men had been—two behind a big rock, others in three or four spots—with shells of various sorts lying around, and one fine heavy automatic pistol. Although later we made inquiries, we could get no trace of anybody, the entire neighborhood being moonshiners."

In Andrew's term, which expired in January, there were destroyed 142 stills, 35 worms, 26,850 gallons of beer, 784 gallons fermenting meal, 228 gallons of singlings, with 17 guns captured, and 138 men captured and indicted, with 25 more to be indicted.

Unfortunately, a sheriff cannot succeed himself. Whether there will ever be any further enforcement of liquor laws in Knott County remains to be seen.

THE BOOK TABLE

THE "GRAND PERHAPS"

BY LYMAN ABBOTT

LIFE has often been compared to a voyage. We are all on shipboard, passengers and crew, coming from we know not where, sailing we know not whither, under a captain whom we never see.

The scientists study the vessel in which we are embarked. What is its structure? what its mechanical contrivances? How can we make the journey with greater ease and comfort? They also study the mechanical structure of the passengers; their nerves, muscles, blood-vessels, digestive and breathing apparatus. The value of the service rendered to their fellow-passengers by these scientific students is incalculable. A few of them have concluded that the passengers are automata, doing what unseen mechanical forces compel them to do. This theory of life is called sometimes materialistic, sometimes mechanistic. Whatever place it has made for itself in the schools, it has never had any considerable influence on social organization or the conduct of life.

The artists are apparently employed in enhancing the pleasure of the voyage: in decoration, music, literature, entertainment. But the more serious of them are animated by a higher purpose. They express beauty in color, form, sound, ideas and ideals—that is, in painting, sculpture, music, and literature—and this does much more than add to happiness; it adds to life. By expressing for us what we cannot express for ourselves they elevate, inspire, enrich the lives of their fellow-passengers.

The philosophers study themselves and their fellows. They seek to ascertain what is the meaning of the voyage, whence these passengers came, whither they are going, what duties they owe to one another, what duties, if any, they owe to their captain, and what they can learn about his character. Much of the prosperity of the voyage depends upon getting the right answer to these questions.

Says Amiel in his journal:

In every union there is a mystery—a certain invisible bond which must not be disturbed. This vital bond in the filial relation is respect; in friendship, esteem; in marriage, confidence; in the collective life, patriotism; in the religious life, faith.

Respect, esteem, confidence, patriotism, faith, are not objects to be observed, they are experiences, and as experiences must be studied. What they are and how they may be developed, trained, harmonized, it is the object of philosophy to ascertain and report. The understanding of them is at least as important to civilization as the understanding of steam and electricity. But

science cannot investigate them. Science can only investigate what it can observe.

Scientific demonstration of ethical and spiritual truth is impossible. All that the scientists can do is to check up the philosophers and tell them whether their interpretations of the *inner* life are inconsistent with what scientific students have discovered in the *outer* life. Religious convictions, like artistic convictions, are in the scientific laboratory only hypotheses, but they are not less certain on that account. They are more certain. We *know* what we have experienced within more surely than we know what we have deduced from the observation of external phenomena. The "Grand Perhaps" becomes an absolute certainty when it is a fruit of the common experience of mankind. "The highest philosophy," says Kant, quoted approvingly by Huxley, "in dealing with the most important concerns in humanity is able to take us no further than the guidance which she affords to the commonest understanding."

This brief and therefore necessarily imperfect and inadequate statement of the essential difference between scientific and religious investigation will, I hope, enable the reader to apprehend a very brief statement of the respective values of the two books¹ which have called forth this article. The character of each is fairly indicated by its title.

Sir Henry Jones in his opening chapter demands absolute freedom of inquiry in religious thought, unhindered by any reverence for tradition. He justly says: "Religion not only cannot but ought not to satisfy the heart of man and control his emotions and will unless it also satisfies the intelligence." To the intelligence Sir Henry Jones appeals; and, while he recognizes the truth that to a purely scientific investigator the convictions of spiritual faith are what Browning has made Bishop Blougram call them, a "grand perhaps," they are none the less on that account to be accepted and acted upon in life. "The Perhaps" of religion, says Sir Henry, "is so magnificent, if it is true: for it gives new worth to everything! While, without it, life is at best petty, its interests are shallow, and it passes away so soon! Indifference as to the truth of this 'Perhaps' is not easy for man and it is not wise."

The conclusion of the Christian religion, confirmed by a broad experience, and therefore much more than a "perhaps" to the Christian, he thus embodies in a pregnant sentence in his closing

chapter: "The religion of Love, which Christianity is, undoubtedly identifies the destiny of God and man: God suffers in our sufferings and rejoices in our joys. He is our Father; and he moves with us, because he moves in us."

"A Student's Philosophy of Religion" has grown out of lectures delivered to students and is essentially a book for students. Professor Wright is not an advocate, but an investigator, and he leads the student by a laboratory method to conclusions which are frankly but not dogmatically stated. He defines religion as "an endeavor to secure the conservation of socially recognized values." In the first half of his book he applies this definition to an examination of the great world religions and notes the unique gift which Christianity has bestowed upon the world: "The matchless personality of Jesus Christ, a personality from whom men may gain a fuller appreciation of moral values, and a reinforcement of their wills so that they may be able to realize these values in their lives." In the last half of his volume he takes up the various theological problems of our time, still as an investigator, and presents his conclusions, stating the problems with great frankness. These conclusions are based on experience, not on scientific or quasi-scientific argument:

"This is a moral universe, that is, it is a universe that recognizes and seeks to achieve moral ends."

"If man would try to find God he must not look without, though God in some sense is everywhere—but must look within."

"The efficiency of prayer is a matter of immediate experience; the existence and nature of God are difficult philosophical questions upon which it is unnecessary for the worshiper to make up his mind in order to receive the benefits of prayer."

"In prayer and other forms of religious experience (at least those of a more rational and intellectual character) man becomes aware of God and is strengthened by Him for the performance of his tasks."

"The man who walks through life with the aid of the Great Companion surely ought to be, and usually is, a wiser, stronger, and better man than one who has to rely solely upon his own efforts and those of his fellow-men. Has a man a *right* to such a belief, however, in view of its uncertainty? . . . There can be but one answer to the question. He certainly has this right."

These disjointed sentences may serve here to indicate the general character of the conclusions of Professor Wright and the spiritual foundation on which they are based. We can best describe his spirit by applying to him the words which he has used in describing Dr. Hastings Rashdall: "Dr. Rashdall's books are among the most helpful in existence for the Christian student who believes that an absolutely honest and

¹ A Faith That Enquires. The Gifford Lectures for the Years 1920-1921. By Sir Henry Jones. The Macmillan Company, New York. \$2.
A Student's Philosophy of Religion. By William Kelley Wright, Ph.D. The Macmillan Company, New York. \$3.75.

fearless study of philosophy will be of more value to him in the end than the obscurantism usually found in religious books written by and for clergymen."

"A Student's Philosophy of Religion" we recommend to the special consideration of ministers who are also students—that is, who do not allow parish

problems so to absorb their attention as to prevent their continuing courses of careful study. It will give the student admirable pictures of the great world religions, and it will help him to understand what both professional and amateur philosophers are thinking about and how to give them sane and spiritual co-operation in their thinking.

THE NEW BOOKS

FICTION

ALL THE WAY BY WATER. By Elizabeth Stancy Payne. The Penn Publishing Company, Philadelphia. \$1.50.

A helter-skelter tale of a girl pursued by detectives for a supposed crime. She takes refuge on a yacht, whose owner aids her to escape and inevitably falls in love with her. Lively, if not probable.

"BROKEN STOWAGE." By David W. Bone. E. P. Dutton & Co., New York. \$2.

In seagoing parlance, "broken stowage" means the small lots of freight put in corners in the hold not needed for main cargo. It is an appropriate name, therefore, for this book of odds and ends about the sea in the way of sketches, talks, and tales written by the author of "The Brassbounder," a volume which gave pleasure and amusement to lovers of the sea and sea lore.

COPPER STREAK TRAIL. By Eugene M. Rhodes. Houghton Mifflin Company, Boston. \$1.75.

In this story of the cowland and the mining country Mr. Rhodes, who is a practiced and successful teller of Western tales, unites into one romance several incidents of an exciting kind. The action is rapid and one's attention is fully held.

COVERED WAGON (THE). By Emerson Hough. D. Appleton & Co., New York. \$2.

Mr. Hough always enjoys visualizing the pioneer advance in our West and the adventures and hardships of those who pushed forward into a new country. In this new novel he compels us to admire the purpose, courage, and sincerity of the men who trekked across the continent and relates incidents of danger and endurance with graphic power. As a novel this is hardly as good as Mr. Quick's "Vandemark's Folly," but as a piece of fictional description it is excellent.

DA SILVA'S WIDOW. By Lucas Malet. Dodd, Mead & Co., New York. \$2.

Short stories by Mrs. Harrison, daughter of Charles Kingsley and best known as the author of "Sir Richard Calmady." Each deals with a dramatic situation or a single human problem.

LOVE-STORY OF ALIETTE BRUNTON. By Gilbert Frankau. The Century Company, New York. \$2.

Two things stand out with almost startling reality in this story of English life. One is the fox-hunting scene, which is described in such detail and with such gusto that one knows the author must have followed the hounds himself; the other is the murder trial, to which the whole situation in the book leads up and the relation of which is dramatic and moving in a high degree.

As a love story—and the author challenges criticism in this direction by his title—the narrative is at times too passionate and at others so long drawn out as to make one wish that the book moved more rapidly.

WANDERING JEW (THE). By E. Temple Thurston. G. P. Putnam's Sons, New York. \$1.75.

The reason for the publication of this play is in doubt unless it was to afford an example of what a shoddy piece of dramatic technique an excellent light novelist can turn out. Strangely enough, any literary qualities that might be supposed to form a part of any enterprise by Mr. Thurston are equally lacking. The famous theme of the Wandering Jew is shaped into a rather tawdry melodrama which reaches its climax in a Spanish Inquisition scene.

WINTER BELL (THE). By Henry M. Rideout. Illustrated. Duffield & Co., New York. \$1.75.

A well-knit tale of a stalwart woodsman falsely accused of murder on convincing but misleading evidence. His out-of-doors spirit is almost, but not quite, crushed by the village lockup, the contumely heaped upon him by the mob, and the bewildering experience of trial, conviction, and State's prison. But a charming vein of romance runs through the story, and when release comes happiness comes with it.

TRAVEL AND DESCRIPTION

CANNIBAL-LAND. By Martin Johnson. Houghton Mifflin Company, Boston. \$3.

The sporadic cannibalism of the poor, decadent savages who inhabit certain of the South Sea islands is "played up" in this book for all that it is worth, or more. Nevertheless the author makes an interesting story of his experiences in trying to obtain moving pictures of the supposed cannibals and their feasts. The photograph of the chief Nagapate was worth going far to get.

NATURALIST IN LA PLATA (THE). By W. H. Hudson. E. P. Dutton & Co., New York. \$2.

The sixth edition of a standard book on South American animals and birds—one of Mr. Hudson's earliest books. Written in his characteristically entertaining style.

OLD PARK STREET AND ITS VICINITY. By Dr. Robert Means Lawrence. Houghton Mifflin Company, New York. \$3.

Boston is rich in traditions of great men and events, and many of these traditions are recorded in this book in a way that will interest every lover of New England. Park Street is one of the shortest of streets, being but the length

of a city block, but it has had many famous residents and its annals are long. The street was worthy of a book, and the book is worthy of the street.

COLGATE'S

Cleans Teeth the Right Way

"Washes" and Polishes—
Doesn't Scratch or Scour

COLGATE'S
is the Double Action
Dentifrice

- (1) Loosens Clinging Particles; (2) Washes Them Away

Sensible in Theory. Colgate's cleanses without disturbing the right mouth conditions. Avoid dentifrices that are strongly alkaline or acid.

Correct in Practice. Dentists know that a dentifrice should do only one thing—clean teeth thoroughly. Colgate's does this better than any other kind of dentifrice.

DO YOU clean your hands by scraping them with sand? Savages used to. But civilization substituted soap. You can scrape your teeth with a gritty, soapless dentifrice. How much safer is the civilized method!

COLGATE & CO. Est. 1806 NEW YORK

Colgate's cleans teeth thoroughly—no dentifrice does more. A LARGE tube costs 25 cents—why pay more?

Truth in Advertising Implies Honesty in Manufacture

THE WEEK-END WILD MAN

BY J. C. LONG

PROBABLY every dweller in civilization, whether of Main Street or the metropolis, dreams of breaking loose some time and getting back to "fundamentals." He wants to go "out where the West begins." Or he pictures himself on some long summer canoeing trip in Alaska. Perhaps his fancy turns to Alaska, or to the mystic beauties of central Asia. At any rate, he wants a change. He wants primarily wild country and fresh air. He wants to shake off confining routine.

But this dweller is an ordinary sort of chap leading an ordinary life. He has perhaps but two weeks' vacation during the year, which he finds have, somehow or other, been scheduled for visits to his own folks and to his wife's relatives. So he puts away his dream of the wilderness and lives with a sense of being thwarted.

To-day, however, thousands are finding that they can be week-end wild men. All they need to do is to step into a

motor car, make certain inquiries, and they will soon be finding their way off the beaten path into the longed-for wilderness. Within week-end motoring distance, within about sixty to seventy miles or less, of the biggest cities in the country can be found great deserted areas where man can commune with the stillness and the stars.

New York City residents can find camping grounds in the Catskills at such places as Chichester, northeast of Kingston, or they can visit the State Forests of North Jersey, which are only three hours away from Jersey City. In these reserves are the ridge and western slope of the Kittatinny Mountains. Here camp sites, spring water, trout fishing, and small game hunting in season are offered free to the public. Three lakes where fishing, boating, and hunting may be had are near by. The camp sites available are of several kinds; some of them near good roads, some in clearings or old fields, and some deep in the

woods. New Jersey resident applications receive first attention, but visitors from other States are welcomed.

The Bostonian will find camping accommodations at Wellesley, or he can purchase a permanent site for his exclusive use in wooded areas which may be found not many miles from the city.

The resident of Philadelphia is not far from the Pocono Mountains and the Delaware Water Gap. He can also find solace in the forests of South Jersey. The "Penn State" Forest of the South Jersey group is five miles east of Chatsworth, on the Central Railroad of New Jersey, and consists of 2,700 acres of pine and cedar forest in one of the wildest sections of that State.

Not far from Cleveland is the camping-ground of Marblehead, located on a peninsula combining the advantages of water and woodland. There is also another wooded camp site near by, at Amherst, Ohio.

There are thousands of square miles of woodland available at moderate prices on the east coast of Michigan, but the transient Detroiters who does not own his own shack in the woods can find accommodations in the outskirts of such communities as Milford and Tecumseh.

There are dozens of towns in Illinois which have set apart outlying woodlands for visitors where the Chicago man can find fresh air and outdoor life.

As one works farther west, the possibilities for a quick journey into the wilderness become increasingly easy. The Rocky Mountain National Park is within ready motoring distance from Denver. California abounds in free playgrounds. There is the Angeles National Forest near Los Angeles, the Santa Barbara National Forest a little farther north, and about seventy-five miles above San Francisco begin the Trinity National Forests.

The beginning week-end wildman would do well to consult such motoring organizations as the American Automobile Association or local motor clubs for maps and information regarding camp sites. He may find it well to initiate his experiences in week-end camping by going to those sites provided by various townships. There he will likely be able to find stoves, shelter, sometimes even hewn wood and electricity, already provided. As he becomes less of a tenderfoot he may branch out into the wilder areas. Then he can write to his State Forester and learn where there are camps in the real wildernesses.

The State Forester is usually a man after whom many other politicians might pattern. There is not usually much money in his job. He is doing it primarily for the love of the work, and he will take pains to help all those wishing to visit his domains. The State Forester of California, for instance, has made a thorough study of the wild man's requirements and makes these suggestions for his equipment:

Clothing.—An old business suit of corduroy, khaki, or overall material. Include a sweater or mackinaw, and figure on medium-weight underwear.

should be of wool, medium-weight, or two pairs of medium-weight cotton. Shoes should be stout, easy on the feet, with soles heavy enough for hobnails. A flannel shirt half size larger than usual should be worn. Leggings of canvas or leather are an advantage, and buckskin gloves without cuffs are best for general use. The hat may be of felt or cloth, with a moderately wide brim.

Bed.—Air mattresses are the most comfortable beds for the mountains, since they can be placed even on bare rocks. There are, however, a number of objections to them, one of which is their cost.

Bedding.—The most serviceable bedding is an eiderdown quilt, with an extra covering of denim, and two light wool blankets. The quilt can be pinned with blanket pins along the bottom or side to form a sleeping bag. Wool quilts can be substituted for eiderdown, although they are not quite as warm. A 7 × 7-foot 10-ounce canvas will make an excellent bedcover to be placed next to the ground, and it is also useful as a pack cover. In the pine forest pine-needles, raked up before building the fire and with the cones removed, will make a wonderful bed.

In addition to their desire to help, the State Foresters realize that besides its health values this camping movement is likely to have a profound effect on National economic policy. We have been exhausting our timber supply. Every one knows about it, every one believes that forestry is a good thing, but it has been a political issue of so minor interest as to command little attention. As the average man develops the camping habit, comes to know the Forest Reserves, forestry will become part of his life. He will meet the officials or their deputies, learn some of the problems, and have the same interest that he has in his home and his town. We may then see the time when conservation will receive the same intent attention as the income tax.

THE MOUTHFUL

A Folk Tale from the Azores

BY ELSIE SPICER FIELDS

ONCE upon a time in one of the islands of the Azores there was a poor woman who lived a most unhappy life. She and her husband were always quarreling. Every day when he came home from work he was cross and said harsh words to her. She always responded with bitter words, and things would go from bad to worse until at last he would beat her.

One day the woman took her water-jar and went to the fountain to fill it as usual. She was so unhappy over her unpleasant life that great tears were rolling down her cheeks. There was a little old woman standing by the fountain.

"What is the matter, my daughter?" she asked as she saw the tears upon the poor woman's cheeks.

When she had heard all the story, the little old woman took the water-jar and filled it at the fountain.

"Go home, my daughter," said she. "Keep this water in the jar. Preserve it carefully. The moment your husband says a cross word to you fill your mouth with a drink of it."

The woman thanked her gratefully, and went to her own home.

The next day when her husband returned from work he began to scold her as usual. She was about to reply when she suddenly remembered the old woman's advice. She ran to the water-jar and filled her mouth with a drink of water. To her great amazement, her husband soon stopped scolding. That night, for the first time in many weeks, she went to sleep without a beating.

Things kept on going well for several days. Just as soon as her husband said unpleasant things she would fill her mouth with water from the jar. Then he would get over being cross. Now there were smiles instead of tears upon the woman's face.

At last, however, the water-jar grew empty. Once more the woman took it to the fountain, hoping that she might again find the little old woman who had given her the magic water. She found her waiting at the fountain.

"How did my prescription succeed, dear daughter?" asked the little old woman.

"How can I ever thank you for all

that you have done for me? Now I am happy once more. My husband no longer beats me. I did not dream that my life could ever be so full of joy. Give me, I pray you, more of the magic water."

The little old woman smiled gently.

"Dear daughter," said she, "the water which I put in your jar is nothing except this from the fountain. It is the very same which you always carry home. This is the secret: When your mouth is full of water, you cannot reply when your husband says cross words to you. If you do not keep up the quarrel, it soon ends. That is why your life is happy now instead of sad. Go home, and whenever your husband says an unkind word to you pretend that your mouth is full of water and do not reply. Go in peace, my child."

The woman always remembered the good advice which the little old woman gave her at the fountain. She never again quarreled with her husband. When she had children of her own, she passed on to them the secret. Now it is generally known in the islands that if one does not want to keep up a quarrel it is well to pretend that his mouth is full of water. This is the reason, perhaps, why the people of the Azores are so peaceful and happy.

SHALL AMERICA CANCEL HER FOREIGN DEBTS?¹

BY THOMAS B. McADAMS

President of the American Bankers Association and Vice-President of the Merchants National Bank of Richmond, Virginia

EVERY day the call comes more clearly for America to assist in working out the great economic and social problems now confronting the peoples of the earth, those complicated questions of internal and international relations upon the solution of which the future of the world's civilization definitely rests. When liberty, which has ever been the inspiration

¹ The substance of an address delivered by Mr. McAdams before the Convention of the Illinois Bankers Association in St. Louis, Missouri, June 23, 1922.

of America, and those principles underlying the right of human beings to have a voice in their own government seemed in jeopardy, our answer was given in no uncertain terms and we spared neither men nor money in stemming the tide which tended to establish the rule of force rather than justice as the controlling factor in civilization. The question confronts us to-day whether we may not delay co-operation so long as to lose largely the effect of the part played by this country in winning the greatest conflict of the ages—a victory, as we be

Complete Service to Importers

WITH branches in Europe, and long-established connections with important correspondents throughout the world, this Company offers to the importer a banking service which can be a real factor in his business.

Commercial Credit

Commercial letters of credit are now the recognized method of financing purchases from foreign countries. Our letters of credit are readily available at banks throughout the world.

Drafts, Cable Transfers

We offer importers favorable rates on drafts and cable transfers payable in the principal countries of the world.

Exchange Contracts

By contracting with us for the payment of foreign money at a specified

date, the importer can protect himself against fluctuation in exchange.

Commodity Loans

We are prepared to consider at all times the making of loans against staple commodities.

Accounts Abroad

The importer can draw his own checks for payments abroad by maintaining accounts with any of our various European offices.

For Buyers Abroad

The facilities of our foreign offices are at the disposal of buyers and representatives traveling abroad. Travelers letters of credit issued by this Company are available in all parts of the world.

There are many other ways in which we can be of service to you. We invite you to make known your needs and we shall be pleased to give you full information.

NEW YORK LONDON PARIS BRUSSELS LIVERPOOL HAVRE ANTWERP CONSTANTINOPLE

lieve, definitely recorded on the side of right and truth. The sacrifices already made and the contributions which future generations will be called on to make in liquidating the heavy burden of debt cheerfully assumed by our people should appeal to us—even though we be callous to the humanitarian call of service to others—to prepare to take our part in readjusting world problems on a basis which will insure the incorporation in such solution as may be agreed upon of the principles and ideals we have always been accustomed to regard as dearer than life itself.

What is our present responsibility? Since the armistice we have made two definite contributions—the limitation of the naval armaments of the leading nations, which inevitably means more expenditures for constructive measures and less for destructive machinery, and the great volume of relief afforded the starving and suffering in different sections of devastated and disorganized Europe. But are we prepared to say that, having done so much, our duty is definitely discharged? Are we fearful that through participation in an economic conference we should be called upon to cancel the \$11,000,000,000 of foreign debts? If this be the reason, it can easily be handled. We do not have to cancel these debts, and such a policy at this time would be a bad thing for debtor and creditor alike. We can follow safely, however, the same policy which would be adopted by a banker under a condition where he found a valued and honest customer of long standing temporarily embarrassed. Under such circumstances, the banker would not stand aside and take no interest in whether the customer improved his condition or went further on the road toward bankruptcy. He would first tell the client he would give him more time, such time as the situation might demand, and then by the organization of a creditors' committee or otherwise give him the benefit of his counsel, his sympathy, his co-operation. This method has been pursued in hundreds of cases in America in the recent past, and splendid old concerns, temporarily on the rocks, have thus been enabled to readjust their budgets, remodel their organizations, and with renewed hope push forward again toward prosperity. Why cannot America, with propriety, aggressively apply the same principles of co-operative helpfulness toward assisting those who are indebted to us to work out their own salvation and ultimately, at some mutually convenient day, liquidate their indebtedness to us? Forgiving a debt rarely cements a friendship; making the terms of payment easy but ultimately insisting upon payment increases the mutual respect of creditor and debtor and makes for stability of character. Mr. D. R. Forgan, of Chicago, has pointed out that no one can see far enough into the future to tell whether or not at the end of another quarter of a century the situation may be reversed and America find herself, after some great upheaval, financially in

No loss to any investor in forty-nine years

THE acid test of forty-nine years—nearly half a century of good times and bad—has been applied to our Safeguarded First Mortgage Investments.

They have come through this test without ever causing any investor a dollar's loss of principal or interest.

Forty-nine years' experience in the field of first mortgage investments in the National Capital has enabled us to develop a definite system of safeguards to protect investors against loss.

We are now offering, at 7%, several new issues secured by apartment buildings in Washington. How long 7% will be the prevailing rate on first mortgages in Washington, it is impossible to say.

Write today for full information.

(Continued)

debt to the world. We would certainly not then wish to request the cancellation of such indebtedness, and the sensible course to pursue would seem to be the keeping these obligations intact against a rainy day—not simply for their monetary value, but for the increased influence this country may exert in the readjustment of world conditions, the rebuilding of world prosperity.

We may have been justified in not going into the League of Nations, but we must recognize that in our refusal we assumed a definite responsibility, should failure result, and it can be fairly attributed to Europe and the world's not receiving the benefit of our assistance, interest, and advice. A weary world has done its best to create a piece of machinery, with all its imperfections, to help stop aggression and the ruthless destruction of property and lives through warfare, to build up a spirit of co-operation among nations, and to substitute sympathy for jealousy in international relations. While undoubtedly approving of the end to be attained, we have refused to even give the machinery created our sympathy and co-operation, and have apparently preferred to believe it can accomplish nothing for humanity, although we have admitted our inability to suggest a better plan or even such modifications of the existing one as would justify our wholeheartedly standing side by side with the other nations in their efforts to insure human happiness as contrasted with despair. Though true it is that reservations were proposed as a basis for the ratification of the Treaty, yet, although the war has been over for nearly four years, America's record as a nation is still one of inaction either with or without modification of the original proposal. Our failure to participate more actively has perhaps been stimulated by the strength of our financial position and the fear that we would be expected to assume the entire responsibility of backing such plans as might be agreed upon; while it has been suggested that budgets should be balanced and foreign obligations to us put in definite form before we could, with propriety, even confer on economic subjects of mutual interest. Perhaps we have been wise so far, but unless we wish to jeopardize everything for which we fought and suffered the time has now come, or will soon be here, when our policy should be more definitely outlined. We cannot through inaction escape either our responsibility or our opportunity. We cannot ignore either the commercial or the humanitarian side of the question. The world needs our advice, our intelligence, our sympathetic guidance; and the very fact that we are separated geographically and have no selfish international ties or ambitions gives us the privilege to speak with the assurance that we will be listened to and affords us the opportunity to render a more substantial service of leadership than can be performed by any of the other great peoples of the world. Does our being rich justify us in hoarding our

resources, like a miser in the midst of a community sorely needing his assistance for a proper development of its activities, both commercial and eleemosynary? Does the fact that we are strong justify us in refusing to use our power in bringing order out of chaos, and will not National laziness be as destructive of the National structure as does human inertia result in destroying real manhood? We cannot answer these questions by simply reiterating the statements of George Washington as to entangling alliances. He was unquestionably right at the time and under the conditions this policy was promulgated for the guidance of the Nation still in swaddling clothes, but no doubt such observations as he would have made as to transportation or the most effective method of lighting a home would be no more completely out of date.

Whether we like it or not, the improvement in transportation and the development of the telephone, telegraph, radio, and the other marvelous inventions of the last century have definitely brought us into close contact with the world, established a mutual interest in the commercial welfare of each other that is essential to progress, and so tied us together as to make our successes and failures largely dependent upon world conditions—world ideals. If this be true, our future commercially challenges us not to throw away our opportunity for suggestive leadership; our progress at home and abroad calls us to see that the principles of consideration for the rights of others be incorporated as an international policy; while the manhood and womanhood of nations large and small—those that have lost everything but hope—cry out to us to contribute something of our time, our ability, our selves, that so far as is humanly possible suffering and desolation may not again be inflicted upon great masses of people simply because the ambition of some ruthless ruler wills that it be so. Can we fail to hear this appeal? Will we much longer stay idly in the background of comfortable surroundings, or will we manfully put on the armor of righteousness and go forward to battle in behalf of life, liberty, and the pursuit of happiness? "Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me."

ARE YOU AN INVESTOR?

During the past year the Financial Editor of The Outlook has helped hundreds of Outlook readers to solve intelligently their particular investment problems. Perhaps you are contemplating a shifting of your present holdings or have fresh funds to invest. In either case we shall be glad to give you specific information on any securities in which you may be interested. A nominal charge of one dollar per inquiry will be made for this special service.

THE OUTLOOK FINANCIAL DEPARTMENT

THE OUTLOOK COMPANY, 381 Fourth Ave., N. Y.

BY THE WAY

ARTHUR BALFOUR, while at a dinner during his visit to Washington, praised the colored people. "I visited Washington a good many years ago," he said. "All the hotel waiters were colored then, and I confess I preferred the quaint colored service to the present sophisticated and elaborate service of the whites.

"The day of my arrival, when my waiter, an old colored man with snowy wool, brought me the menu, I put a coin in his hand and said, 'Just bring me a good dinner, uncle.'

"He brought me an exquisite dinner, and during my fortnight's stay we followed out this programme daily. By pushing aside the menu and handing him the coin, he selected a much better dinner for me than I could have chosen myself.

"The day of my departure, as I took leave of him, he said,

"'Good-by, sir, and good luck, and when you or any of your friends what can't read the bill of fare comes to Washington, just ask for old Calhoun Clay.'"

From the "Minnesota Star:"

"Golf not only improves your general health, but enables you to understand the jokes in the comic weeklies."

From "Kasper," of Stockholm:

Apothecary's Apprentice—"What is in this bottle with no label?"

Chemist—"That's what you use when you can't read the prescription."

American shipping was rarely seen in Hamburg before the war, but it now occupies third place in the tonnage of the port, according to a statement in a nautical magazine. Hamburg was once the world's greatest port as to amount of tonnage. Last year it had recovered its status to the extent that its tonnage amounted to about sixty per cent of that in 1913. In this tonnage British shipping occupied the first place, German the second, and American the third.

In Poland there was a period following the war when over a million sub-normal children received daily one substantial, warm, carefully balanced meal of American food. Poland is now getting on its feet again, and the children of that country have forwarded to the children of the United States, as a testimonial of their gratitude, a huge quantity of souvenir toys, which are to be distributed among invalid, crippled, and orphaned children here by the American Relief Administration. These souvenirs were made by Polish children with their own hands, as a labor of love. They filled eighty-eight enormous cases when shipped to America.

Newspapers in India, a correspondent of the "American Printer" says, are mostly printed in English by natives, who, though knowing little of any language but their own, are marvelously adroit in setting up "copy" the white man reads to them line by line. The

white man has his troubles with the natives, however. They are strong competitors. "Every half-caste who wishes to lead a peaceful life purchases a second-hand press. Thus armed, he enters the fray without knowing anything about the business. The native proprietor of a job press is another competitor. There also is the Parsee printer, the persistent Japanese, the plodding and watchful Chinese. The manager must do everything from correcting proofs to overhauling the engine. All advertisers expect an editorial puff—if the editor objects, out he goes, for, say many proprietors, 'advertisements are to a newspaper as the very breath of life; editors are not.'" There are also countless vernacular sheets in India, many being printed in secret dens on an old-fashioned screw press.

In boyhood reminiscences of New England life James L. Ford tells in "Scribner's" of his experiences at a Friday evening prayer-meeting long ago in his native village. "On this occasion," he says, "I witnessed two elderly rustics engaged in their favorite pastime of praying at one another. One of these interlarded his supplication with: 'And if they be enny one of us here ez hez been a leettle mite sharp on a hoss trade, we ask the Divine forgiveness for their sin.' When the other man's turn came, I heard a nasal voice saying: 'And if they be enny of us pore sinful critters ez hez burned down their barns for the insurance money, we hope they will find forgiveness and grace.'"

The little Abbey of Buckfast was a Cistercian house destroyed by Henry VIII, Edward Hutton says in the London "Sphere." "I imagine," he goes on, "had any one thought of the matter during the last four hundred years he would have regarded it as dead as mutton, the last place in the world to experience a resurrection. Well, it is rising again. It is risen. With their own hands the monks have actually rebuilt it larger and greater than ever it was. They have erected an enormous church, with a huge central tower containing fourteen bells, one of which weighs two tons. They have built a noble monastery, a cloister is about to be erected, and in August the great new church will be dedicated. The bees—the monks live by their bees—should swarm finely this year."

"Tram conductors in Prague," "Punch" remarks, "salute passengers as they alight by saying, 'We have been honored by your presence.' In London the abbreviated version of this courtesy is 'Push off.'" And on the New York subways, "Wash step!"

Paris, according to the New York "Evening Post," is trying to devise a plan to distinguish waiters from guests. An infallible sign, the "Post" says, is that if you are utterly unable to catch a man's eye, he is a waiter.

A Cash Offer for Cartoons and Photographs

Cash payments, from \$1 to \$5, will promptly be made to our readers who send us a cartoon or photograph accepted by The Outlook. Cartoons will not be returned. Each one should be marked with name and address of sender to assure payment if accepted. Photographs should be sent with return postage enclosed.

We want to see the best cartoons published in your local papers, and the most interesting and newsy pictures you may own.

The Outlook

JULY 19, 1922

S

A WAR AVERTED

THE Chileans and Peruvians, although they took a little longer than some had expected, have reached an agreement in regard to arbitration of their Tacna-Arica differences. The acceptance on July 8 by the Chileans of the latest Peruvian proposal, providing for the friendly intervention of the United States in case the decision of the arbiter is against the holding of a plebiscite to determine ownership of the disputed provinces, brought the conference which has been in progress in Washington since May 15 to a virtual conclusion. Only the final drafting of the protocol remained to be done, and that was not expected to take more than a week and will not present any difficulties, as all the principles have now been agreed upon.

This means that in two months, through the invitation extended by President Harding to the two countries to send their delegates to Washington and through the informal good services which Secretary Hughes has rendered in the negotiations after the failure of the two delegations to reach a direct agreement, there has been happily and successfully solved a problem which for thirty years past has been a source of misunderstanding and ill feeling between Chile and Peru and a threatened source of war and international friction in South America.

The success of the conference in Washington should add to the prestige of the United States throughout Latin America and help to strengthen inter-American relations. There are other boundary disputes in South America (between Ecuador, Peru, and Colombia; Bolivia and Paraguay; and a question of the Plate River line between Argentina and Uruguay, although this latter is practically *in statu quo* and not likely to cause any trouble); also several pending boundary questions in Central America; but none of them has been of the importance or possible source of danger as has Tacna-Arica. Therefore the settlement of this problem, which in a short time will be an interesting matter of history, can be looked on as a great accomplishment.

THE IRISH GOVERN IRELAND

AN Irish majority is behind the Irish Free State, and now an Irish army has put down the minority insurgents. With the collapse of the attempt to hold the ancient Four Courts building as a

(C) Keystone

THE FOUR COURTS

Scene of the dramatic battle for the right of the Irish majority to rule. This struggle is destined, perhaps, to prove as memorable as the fall of the Bastille

fortress and the defeat of minor revolutionary outbreaks in Dublin and elsewhere the ascendancy of the Free State is attained and its power to carry on government proved. De Valera, as we write, is in hiding; his fellow-leader Charles Burgess (Cathal Brugha, in the old Irish tongue) has died of wounds; other leaders are scattered or prisoners. No doubt the flame of insurrection will still flicker here and there in Southern Ireland, but the main body of the people have shown that they will not join in an effort to overthrow by violence the rule established with their consent by their own fellow-countrymen.

Even in Ireland majorities have some rights. The patriotic idealism which longs for absolute independence is not dead and is held even by many of those who are wise where the followers of De Valera are wild. That ideal is impossible of attainment at this time; sensible minds accept self-government as part of the British dominions as preferable to turmoil and bloodshed.

The Free State Government in calling upon Irishmen to enlist in the only existent legal Irish army—a call that is being answered by thousands of enlistments—declares that the national army now in existence is able to cope, and has coped, with organized resistance on a large scale, but that local outbreaks of disaffection require a large force. The proclamation puts the case in a nutshell when it says: "The valor and patriotism of our national army has broken the conspiracy to override the will of the

nation and subject the people to a despotism based on brigandage and ruthlessness, regardless of the people's inalienable right to life, liberty, and security."

The new Ireland is being established, not by England, but by the Irish.

SOUNDING BY SOUND

STRANGE as it may seem, in all the centuries that man has been sailing the seas he but little improved his methods of sounding the depths of the ocean, certainly not much from the days of Columbus and Magellan, until World War developments made radio apparatus available for the purpose. But since 1918 listening devices used by the submarine chasers in the war zone have been made so efficient that the mechanical errors of deep-sea sounding have been eliminated, and the human error, confined to the acuteness of the auditory nerve, nearly so.

A short time ago the United States destroyer Stewart finished a cruise from Newport to Gibraltar and return, during which a new sounding device which can be used in both deep and shallow water was given a service test. The results of the test show that a minute and accurate exploration of all the sea floor of the globe is possible by the use of this new device. Here, then, is an invention which bids fair to revolutionize piloting and navigation. Here is one more milestone toward ultimate safety in maritime transportation.

It seems that the Stewart made the

outward trip from Newport to Gibraltar in nine days, during which time over nine hundred soundings were taken at frequencies varying from twenty minutes down to two minutes. This did not interfere with the ship's movements, she steaming along the course at fifteen knots, except a two-hour period when special soundings at one-minute intervals were taken. These latter soundings proved that successful work can be accomplished by the device at intervals of one minute in the deepest water. Thus the outline of the bottom of the sea over the course between Josephine and Tysburg Banks was minutely recorded. The sea bottom there was found to be an extensive plain bordered by mountains and tablelands, some of which rose four thousand feet above the plain. Several deep depressions not heretofore charted were also discovered, and positive depth data were secured where mariner's charts show only negative data in the vicinity of the Azores. It is believed that the outline of the world's ocean trade routes would give any number of such landmarks for use in finding a ship's position.

This new device gives immediate measurements of the depths of water, even at high speeds, so that delays in reading the depth are reduced to a negligible interval, there being no lead to heave or wire to unreel and reel, as in the other means of obtaining soundings. The apparatus is the result of a solution of a very definite naval problem, and was designed principally by Harvey C. Hayes, physicist of the Naval Engineering Experiment Station at Annapolis. The device uses a sound transmitter in combination with a sound receiver and depends in its operation upon the reflected echo of a signal given off by the vessel's sound transmitter being received by the same vessel's receiver. The sounding transmitter in this device develops a high frequency vibration in a diaphragm which is in contact with the sea water against the vessel's hull. This high-pitched note carries a great many miles, while the receiver is capable of registering sound transmitter signals over a great distance; hence its ability to pick up the "echo" of sound reflected from the ocean's bottom at depths which are impracticable for the old types of sounding machines.

This universal sounding apparatus can be chalked up as a credit when the taxpayer counts the cost of the Navy, for, like many other naval developments, it has a very definite value commercially, and will be in use for all time. It is possible now to construct the device cheaply and install it on merchant ships, where it will prove of the utmost benefit to navigators, especially in foggy

and thick weather, when ships have to rely to a considerable extent upon the taking of soundings.

One by one the terrors of the sea are being robbed of their worst features and some are being done away with altogether by the development of electrical appliances in the hands of our naval experts. All this goes to show that the naval officer is not alone a warrior who breathes out threatenings and slaughter, but he is also a scientist who has the trained mental equipment to attack the million and one problems of this mechanical age of sea power and arrive at a solution which is available for the navy and the merchant marine alike.

EDUCATORS IN COUNCIL

THE annual Convention of the National Education Association, held in Boston during the week ending July 8, was notable for its freedom from platitudes and its abundance of practical talk. The place of honor must be given to the paper written Secretary Hughes and read before the Convention. Mr. Hughes's generalizations were never raw nor sleepy. His address was often epigrammatic and always practical and forceful. Such phrases as "The primary lesson for the citizens of democracy is self-control" and "The sentimentalists are just as dangerous as the materialists" illustrate the pointed vigor of the address.

Mr. Hughes's topic was "Aims in American Education," which might mean almost anything, but his application of his subject to the needs of the community was concrete. He declared, for instance, that to get results we must insist on accuracy, on mastery of a subject, and that in the secondary schools at least "we should stop scattering." Mr. Hughes explained this by affirming that in high schools and academies "there is at present a bewildering and unsuccessful attempt at comprehensiveness. It fails of its purpose in giving neither adequate information nor discipline." He frankly declared that personally he did not think a satisfactory substitute had been found for the classical and mathematical training, but declared that, however this might be, "the important point is insistence upon concentration and thoroughness." On similar reasoning he deprecated "intellectual vagrancy in college."

The entire programme of the meeting was notable for the specific and definite nature of the topics discussed and the papers read. It really gave the thousands of teachers present the substance of a short summer school in education, with the advantage of lecturers and speakers of National reputation.

The Association again declared its endorsement of the Towner-Sterling Bill

creating a Federal Department of Education and providing National aid for education. It is reported that the Convention was stirred to a strong utterance on this point because of what one of the press reports calls "a curiously ill-timed assertion" in the speech of welcome made by a representative of Mayor Curley, who said that "Boston was self-sufficient in education and wouldn't stand for any interference from the United States or anybody else."

Though State public school systems should be co-ordinated, we think that the plan of doing this by Federal control through a secretary in the Cabinet should be considered with greatest caution.

The next meeting of the National Education Association will be a World Meeting and forty-five nations have been invited to send representatives. Out of this meeting it is hoped that an international association and a permanent council of international research will be formed.

The new President of the National Education Association is Mr. William B. Owen, the President of the Chicago Normal College.

THE LEGION AND THE BONUS

OPPOSITION to the proposed bonus for all American veterans of the World War has been characterized so largely by charges that the advocates of the bonus are selfish, disregardful of the welfare of the Nation, actuated by greed for public funds or desire for political support, that it is almost necessary for an opponent of the bonus who believes in the honesty of the ex-service men and the public spirit of the average Congressman and Senator to keep assuring himself of his own consistency. As a matter of fact, the widespread approval of the proposed bonus would be impossible if the demand for the bonus were nothing but a raid on the public treasury. Some Congressmen have undoubtedly been reckless in making promises that now they find it difficult to fulfill, and some of the men who served in the war have become embittered by their experience and have lost their enthusiasm for sacrifice in the interest of the public which has forgotten them; but, on the whole, there is every reason to believe that both the opponents and the supporters of the Bonus Bill are for the most part good average citizens who want Congress to do what is just and right and reasonable in the matter.

Addressing itself to the opponents of the Bonus Bill, the American Legion, through one of its spokesmen, John Thomas Taylor, Vice-Chairman of the Legion's National Legislative Committee, prepared a statement, at the request of the New York "Herald," one of the

Clubb in the Rochester Herald

THE GOOD-NIGHT STORY

From Julius J. H. Hayn, Buffalo, N. Y.

most vigorous opponents of the bonus, outlining the Legion's position.

In view of what is asserted to be the approaching passage of the Bonus Bill, Mr. Taylor in his statement urges the opponents now to turn their attention to aiding the veteran in making his selection among alternative forms of bonus which will be offered to him. The mass of the common people, he asserts, have approved the bonus because they understand the privations of the veteran. The opponents of the bonus, on the other hand, he says, are members of that class that think and live in terms of money and have profited most from the war. Concerning this, the thing Mr. Taylor has overlooked is the large number of farmers, as well as men of very moderate means who are dependent on salaries, who oppose the bonus, not out of any lack of sympathy for the veteran, but out of concern over the danger involved in any additional financial burden upon the Nation.

Mr. Taylor's statement is a reminder that all the other countries on the Allied side in the war provided for adjusted compensation at the close of the war; and that the lower house of Congress has approved the provision for adjusted compensation by a vote of 333 to 70. Above the physical benefits of the bill he places the mental and spiritual benefit that will come to the veteran in the evidence that his country appreciates his services and sacrifices. In particular, Mr. Taylor says:

Everybody who reads the bill is for it because of its constructive features. The main opposition to it has been through ignorance of these provisions, which include home and farm aid, vocational training, land reclamation, and paid-up insurance.

This latter has been the chief object of attack because, like other paid-up insurance policies, it carries a loan privilege, first from the banks and later from the Government. In addition veterans entitled to less than \$50 on their adjusted service credit may receive their obligations in cash.

These constructive features are intended to help stabilize the veteran, aid him in getting back to his former station in life, and, if possible, to place him in the position he would have occupied had he not been called to take up arms in defense of his country, and they are intended to prevent him from being penalized economically for his service compared to the man who stayed at home and reaped the benefits and rewards.

Such a statement as this by Mr. Taylor should have the attention of the opponents as well as the supporters of the Bonus Bill now in Congress. Whatever may be said in favor of the cash features of the Bonus Bill, however, the fact remains that the men in authority who understand finance and who understand the veteran are convinced that any measure entailing the obligations in-

WALTER M. HOOVER, WINNER OF THE DIAMOND SCULLS

involved in this bill will do more harm to the veterans by retarding the recovery of prosperity in this country than any good that could come through direct payment of money.

WITH RACKETS AND OARS

A FRENCHWOMAN and an American fought out the finals for the British tennis championship. The representative of France and the winner was Mademoiselle Suzanne Lenglen. The American representative was Mrs. Mallory. The disappointing record made by Mademoiselle Lenglen during her last year's invasion of America was more than wiped out by her decisive defeat of the woman before whom she was forced to withdraw last summer. Though the cable despatches indicate that the fight was closer than the score would lead one to believe, a defeat to the tune of 6-2, 6-0 can be explained on the grounds of nothing but absolute superiority. We are sorry to find that Mrs. Mallory has been reported as complaining that the match was played too late in the day to afford an equitable test of skill. The sun shines alike, we have been told, on the just and the unjust. It also shines alike on the defeated and the victor.

If our representatives in the Women's British Tennis Championship failed to carry off the wreath of victory, we were at least more fortunate in a British event of perhaps even greater importance. The American sculling champion, Walter M. Hoover, of Duluth, won the Diamond Sculls at Henley-on-Thames by the generous margin of fifty yards. The contest for the Diamond Sculls has been rowed for nearly one hundred years. It is twenty-two years since an American crossed the line a victor. B. H. Howell won the race in 1900. The

first American to win the trophy was E. H. Ten Eyck, of Worcester, who rowed for it in 1897. Apparently Hoover was given a most cordial reception by his British opponents.

GOOD BUSINESS IN GOVERNMENT

THE Government, closing its books at the end of the fiscal year, finds that it is apparently \$338,269,000 richer than anticipated. A threatened deficit of \$24,468,000 has been converted into an actual balance of \$313,801,000.

The transformation is largely one of dates, rather than figures. Analysis of the balance-sheet discloses that the \$338,000,000 change was brought about by two circumstances, as follows:

First, the Government collected about \$138,000,000 more than it had expected to collect during the fiscal year; and,

Second, the Government spent about \$200,000,000 less than it had expected to spend.

In the first total there is a windfall of \$81,000,000 from the Emergency Tariff Law. When the Director of the Budget submitted his estimates to the President last December, customs receipts for the fiscal year were placed at \$275,000,000. Presumably the Director adopted the estimate of the Government actuary and other Treasury officials. They guessed wrong on the tariff and wrong on the volume of imports to the extent of about twenty-five per cent, their error being an understatement of receipts, with the result that there are un hoped-for millions in the Treasury to-day. This kind of wrong guessing, however, is the sign of a careful management.

In addition, \$44,000,000 were received from a totally unexpected source, the Federal land banks. These institutions experienced difficulty several years ago in disposing of their bonds, and in addition were hampered in their financial operations by a court decision, so the Government took their securities, paying cash therefor. The bonds were a frozen asset until recently, when the situation changed. They became liquid, and the land banks bought them back.

The remaining \$13,000,000 of unexpected receipts came from other quarters. A considerable sum came from heavy sales of surplus war materials left on the Government's hands.

On the spending side, we have paid out \$200,000,000 less than we had counted on paying out, but we have not saved it. The obligation to pay remains; it merely has been postponed from the last fiscal year to the present one. For a certainty, it will be reflected in the balance-sheet at the close of this year. As Secretary Mellon wrote Senator McCumber last April, that sum "represents delayed settlements [with the railways] of matters arising out of

(C) Harris & Ewing

RAILWAY EMPLOYEES AT WASHINGTON QUITTING WORK—THEIR FACES SEEM TO INDICATE THAT THEY ARE STRIKING CHEERFULLY!

Federal control and under the guaranty for the six months following Federal control. . . . The postponement of these payments to 1923 is, of course, reflected in a corresponding reduction of railroad expenditures for 1922."

Under the budget system, now nearing the first anniversary of its inauguration, there has been undoubted economy in Government expenditure, but the economy is shown indirectly in the balance-sheet. The savings were effected last fall, when General Dawes clipped the wings of soaring estimates. There is no one item that is Dawes's on the balance-sheet; no entry upon which a searching finger can be placed in identification of a budget saving. But Dawes and the budget are there, none the less; were it not for the system and the pruning knife, cost of government in 1922 would have been millions more and the balance on hand millions less.

THE FUTILE VIOLENCE OF RAILWAY STRIKERS

BEGINNING peacefully, the strike of the railway shopmen has lately been in some places accompanied by acts of lawless violence. In the neighborhood of one of the division shops in Missouri, strikers stopped a Wabash train, cut the air hose, and threw rocks in the windows, and have so interfered in another place in Missouri with officers of the company as to prevent the performance of their duties. The President of the Wabash Railway Company, reciting these facts, has appealed to the Governor of the State and, in order to prevent interference with the operation of mail trains, to the Federal Post Office Department. Strikers have also interfered by violence with mail trains in Texas and have caused loss of life by riots in Illinois. In perpetrating such acts the strikers are doing injury to a cause which at best is not good. They

are not merely trying to put out of order the transportation facilities of the country, but to injure the Railroad Labor Board, which the people of the Nation, through their representatives in Congress, have erected as an instrument for subordinating the interests of railway operator and railway employee alike to the interest of the public.

In contrast to the shopmen, those employees of the railways who are engaged in the maintenance of ways have chosen so far a reasonable course. Without yielding anything in their contention that the Labor Board's wage decision was unjust, the maintenance of way unions have decided to continue work at the present wage decision under protest, meanwhile taking up their grievances first with the railway managers, and, in case of failure there, to bring them for reconsideration before the Labor Board. This is applying to industrial questions the same spirit that men accustomed to free institutions apply to political questions. In countries where revolutions prevail the cause of instability is the unwillingness of the people to abide by the decision made by the courts and at the polls. Until men learn to abide by such decisions and use orderly methods to see that they are reversed if they think they are unjust there will likewise be instability in industry. We hope that the course pursued by the maintenance of way unions, as stated by Mr. E. F. Grable, their chief, will find its natural reward in a sympathetic consideration of their reasonable claims. And we hope, for the same reason, that the striking railway shopmen will meet with pronounced and instructive failure.

A REASONABLE WAGE SETTLEMENT

IN the midst of the railway strike, with all its bitterness, confusion, and inconvenience, it is comfortable and as-

suring to read the official announcement that the Pennsylvania Railroad and over forty thousand of its employees have come to an agreement on a disputed question of wages by conference methods instead of by a resort to a strike.

In our issue for August 31 last Sherman Rogers, Industrial Correspondent of The Outlook and one of the foremost leaders in this country of the movement for employee representation in industry, reported the adoption by the Pennsylvania Railroad of an employee representation plan which "is one of the broadest in real democratic principle in existence to-day." This plan provides that delegates elected by the employees "will sit with the company's officials and draft all rules and regulations pertaining to relations between the management and men."

Acting under this arrangement, an agreement has just been made, effective July 1, for the reduction of wages, with due regard to the cost of living, in the departments of maintenance of way and of telegraphs and signals. Because of this employee representation plan the Pennsylvania Railroad was not a party to the agreement between the United States Railroad Labor Board and the other railway companies of the country.

THE OFFICIAL STATEMENT

THIS action of the Pennsylvania Railroad and its employees is so important in itself and is so indicative of what might be done more generally in American industry that we quote at length from the official statement of the Pennsylvania Company as follows:

The negotiations were entirely voluntary and were conducted solely between management representatives on the one side and elected representatives of the employees on the other, free from outside intervention.

The information on which these negotiations were based was gathered,

jointly, by representatives of the management and of the employees, from industries in the territory served by the Pennsylvania system. The management desires to thank not only the employees and their officers concerned for the spirit in which the negotiations were conducted, but also the industries along the lines of the system for their co-operation in furnishing such information.

This successful outcome of the wage negotiations with the maintenance-of-way and telegraph and signal employees constitutes one of the most notable achievements thus far recorded for the Pennsylvania Railroad's employee representation plan. This plan, for the amicable settlement of controversial questions, was first put into effect, by mutual consent, on January 1, 1921.

Since that time, and prior to the opening of negotiations over the pending wage revisions, the plan has been instrumental in bringing to peaceful and satisfactory settlement more than nine thousand controversial questions between management and employees.

The spirit of this announcement and of the action that led to it illustrates the principles of what *The Outlook* has for many years been calling industrial democracy, and for as many years has therefore often been denounced, on the one hand by stubborn reactionaries, and on the other by intellectual radicals, as visionary and impractically optimistic. Mr. Gompers is an example of the reactionary and Professor James Harvey Robinson of the intellectual radical. Mr. Gompers opposes the employee representation plan because he wants the despotic power, formerly unmistakably wielded by organized capital, transferred to organized labor. He stands for class domination, not for co-operation. Professor Robinson in his "Mind in the Making" not only assumes but positively asserts that reformers may expect to find preachers, universities, and business men giving no help in the endeavors after industrial justice.

We may perhaps add without too much pride that General Atterbury, Vice-President of the Pennsylvania Railroad, who has been devoted in his support of the employee representation plan, has acknowledged the important part performed by Sherman Rogers, of our staff, in its successful introduction on the Pennsylvania system.

THE PRESIDENT'S PLAN FOR ENDING THE COAL STRIKE

HAVING called representatives of the striking miners and of the mine operators into joint conference, President Harding put before them last week a proposal which he hoped would end their deadlock.

Recognizing the serious consequences

which would follow a coal famine that could hardly be avoided if production were not resumed, the President suggested that the miners return to work at the old scale, which would remain effective until August 10, but that in the meantime a coal commission, consisting of three members to be chosen by the miners, three by the operators, and five by the President himself, should determine a temporary basic wage scale to be effective until next March; that in case of failure to reach a decision by August 10 the commission should have power to direct the continuation of work on the old scale until the new scale is ready. Involved in this plan is a proposal for a thorough investigation of every phase of the coal industry.

This plan is not unlike that which was proposed by President Roosevelt during the great anthracite strike of 1902.

Obstacles in the way of the immediate adoption of President Harding's plan at once presented themselves. One of the most serious of these was the fact that the operators' representatives at the conference were not nominally representative of the whole coal industry. Another obstacle lay in the fact that one of the very questions in dispute was whether the strike should be settled Nationally or by districts. Before this issue of *The Outlook* reaches its readers it is probable that the success or failure of this plan will be definitely known.

In the light of what happened to the obstructionists in the case of the anthracite strike in 1902, it is hard to imagine any group putting itself in the way of a reasonable plan for providing fuel for the needs of industry and for households during the coming winter.

THE SMALL COLLEGE

THE small college is coming into its own again.

In the early days an American college education was to be had only in small institutions. Harvard a hundred years ago had no more students than Amherst or Williams have to-day. The very phrase "small college" was given a special flavor by Daniel Webster in his famous apostrophe to Dartmouth before the United States Supreme Court.

But not long after Webster's time the pendulum of education began to swing the other way. Money was given and students flocked to the big universities. The cry was all for vocational education, for training that enabled a man to get a lucrative job in industry or finance, for physicists and chemists and engineers, for schools of mines and lab-

oratories and hydroelectrical research equipment.

Against this flood tide the small colleges struggled on—sometimes valiantly, sometimes foolishly, but always feebly. For the small college cannot either in teaching staff or equipment compete with the great endowed or State universities in furnishing a training in applied science or scientific research.

But all the time the small college has had a function, a peculiar function, which it too often either forgot or neglected—a function which during the recent graduating season was recalled by more than one college president and by several distinguished Commencement speakers. Secretary Hughes and President Harding both referred to it in effective educational addresses.

That function is, not the discovery and dissemination of new facts in science or philosophy, but the development of character or personality in the individual student. It was this that President Garfield had in mind when he defined the ideal college as a log of wood with Mark Hopkins at one end and a student at the other.

If any failure is to be ascribed to the great university, it is the failure to assure this personal contact. Of the undergraduates that passed through Harvard during William James's incumbency how many failed to come into vital touch with that great spirit that now regret what they lost!

That this vitalizing intercourse may, and does, exist at the small college was illustrated by a delightful incident at Bowdoin's Commencement. In conferring the honorary degree of Doctor of Science upon Professor William Albion Moody, of Bowdoin, President Sills used these words: "Thirty-eight years teacher of mathematics at his Alma Mater who has made generations of freshmen tremble and generations of graduates rise up to bless him for having inoculated honest intellectual habits."

At this characterization a ripple of appreciative laughter and applause swept over the graduating class, which, clad in academic gowns, sat in front of the dais. Not one of them, however often he may have flunked in Professor Moody's classroom, or however small the residuum of mathematical formulæ which his mind retained, but felt a sense of gratitude, not for equations he had been taught, but for the impress he had received of an upright, high-minded, clear-seeing, straight-thinking, honest-hoping personality.

For this kind of education there are needed no laboratories, no rich equipment of apparatus, no complicated and expensive machinery—only a blackboard, a few choice books, a love of

truth, a desire to know what the noble minds of the past have done, and a great spirit of human sympathy and a divine yearning for the future of the race. These the small college can possess, and the colleges or universities, large or small, that do possess them will give us our future leaders.

THE FIGHT OF A CLEAN SPORTSMAN

THERE is no name in the annals of professional baseball in this country which has lingered affectionately so many years in the memory of millions of fans as has the name of Christy Mathewson. Only last week an emotional wave of interest again swept over the United States when this idol of other years was reported in every important newspaper from the Atlantic to the Pacific to have hurled the first ball in a "bush" league game at Saranac Lake, straight and true across the plate for a "strike." It was the only ball he pitched, but some two thousand persons, including old friends from near and far, gathered in that secluded health center to see Mathewson do it.

He appears to be winning a grim fight of years with tuberculosis, contracted abroad, if memory serves us right, with the American Expeditionary Forces; winning it by the exercise to the utmost of the highest human quality of perfect self-control which made him so long a pre-eminent victor on the baseball diamond. He was a human thoroughbred in this field of National sport. He was applauded by millions for his character as much as for his victories, and the chief quality of his character was self-control. Nobody who has ever seen him pitch can forget it. The rest of the team might go to pieces, but Mathewson never did. Batters might find his curves furiously for the time being, but he coolly bided the turn of the tide. He was directly credited by the experts with winning one of the World's Series single-handed. Our recollection is that in this series the opposing team did not score a run against him. He never disputed an umpire's decision. He might look whimsically and regretfully in an umpire's direction, but he never said a word. He was a marked contrast to the latest popular idol, Babe Ruth, whose self-indulgent two hundred and fifty pounds seems always to be brawling with umpires, and who seems to be always wishing to thrash the grand stand whenever he strikes out and the grand stand jeers.

Mathewson was a graduate of Bucknell University, in Pennsylvania, and he

was an intelligent thoroughbred in his chosen vocation. Breeding and training will tell, whether in man or beast. Joe Patchen was the most famous race-horse of his time, because added to his other qualities was a perfect self-control. When the whole field of horses came rushing down towards the judges' stand and the bell rang for them to try again because they were not fairly in line when they passed the starting-point, all the other horses might go tearing down the field in a frenzy of excitement before they were pulled up; but as soon as he heard the bell Joe Patchen would stop suddenly as if he had a stroke of apoplexy and, turning quietly around, would walk slowly back to the original position at a great saving of energy and nerve over his adversaries. But he was usually good to win three out of four heats in any race in which he entered. He was everything that every other horse was, plus self-control.

It is Christy Mathewson's human self-control which has shown itself in a highly intelligent, unblemished character and career, which brought him unprecedented success on the baseball diamond, and which is now probably happily winning for him his fight with one of the grimmest and the most subtle of all physical foes.

Good breeding and good discipline count heavily. One of the Harvard rowing coaches at New London the other day is credited with a bit of philosophy in describing what brings victory in a grueling four-mile race. He is reported to have said to his men that the way they would perform in the first mile depended upon their training, in the second mile upon how they personally had lived, in the third mile upon how their fathers had lived, and in the fourth mile upon how their ancestors generally had lived.

Christy Mathewson has not only a good character and technical training, but he must also have a good pedigree.

Last year, when it became known that he needed funds in his fight at Saranac, a single benefit game on the Polo Grounds in New York netted him, according to our recollection, from thirty to forty thousand dollars. And there was no limit to the extent of his backing by the vast multitude of his admirers. It was not that he was a great sportsman pitcher, although he was that. There have been other great pitchers. But the thought of the kind of man Christy Mathewson had always been aroused the generosity of a great company of Americans. Mathewson is a type, whether in sport or politics or business, which the American people prize.

MUSIC AND POLITICS

IN an impromptu speech before the Republican Glee Club of Columbus, Ohio, President Harding drew a natural and apt comparison. He said, if we may paraphrase his words as they were reported in the despatches, that political parties were like glee clubs—they could only be successful if all the members sang together. He said that if the members of glee clubs acted like some party workers the sopranos would demand special consideration because they sang soprano and the altos, tenors, and basses would do likewise, to the immediate destruction of harmony and the eventual destruction of the glee club. He continued his comparison by applying it to his own situation. We quote directly. "I don't care to be a soloist," he said, "because I am President, but somebody has to do the directing. If men are not willing to sing to measure and score and the director's plan of harmony, there will not be much singing."

The President's comparison is admirable. Political parties must sing together if they are to produce the music of organized government. But the comparison can be developed further than it was by the President, if he has been completely quoted.

Political parties are like glee clubs. We have two such major glee clubs in the United States. These organizations are striving, not only for harmony within their ranks, but also to attract a National audience. They must, if they are to be successful, not only sing well, but they must also sing the music which the public wants.

In 1912 the music sung by the Republican glee club was so badly chosen that the bulk of the regular audience marched out of the Republican tent in a body, to the great advantage of the Democratic choir leader across the street. By 1916 a large body of auditors had tired of the Democratic programme, but not enough had gone back to the Republican tent to fill the house. By 1920 the tunes of the Democratic club had worn out their welcome, with the result that the Republican glee club director had to hang out a S. R. O. sign after the November elections.

The National audience will listen to the glee club which offers the most inviting programme, played with the greatest skill. The skill is important, but the programme must not be forgotten.

We think that there are increasing signs that the public is growing weary of some of the tunes in the Republican repertoire.

“AT WAR OVER CIVIL SERVICE”

FEW articles ever published in The Outlook have elicited such strong protests as the special correspondence by Newton Fuessle entitled “Washington at War Over Civil Service,” which was published in our issue of June 14. This article was based upon statements secured from sources which both The Outlook and Mr. Fuessle had good reason to consider most authoritative as to the facts in the case. Some of the protests against this article have come from people interested in Civil Service reform; some have come from men with experience in Government positions of administrative responsibility; some from present or former Civil Service employees; and three from officers, National or local, of the Federation of Federal Employees.

Most of these protests, even when vigorous, are restrained in language and generously refrain from attributing to Mr.

Fuessle and to The Outlook any intention to misrepresent the facts.

The one letter which is heated as well as earnest in its remonstrance is from the Acting President of the National Federation of Federal Employees. It characterizes the article as ignorant and demagogic.

In general, writers of these letters of protest seem to understand that the purpose of this article was not to state The Outlook's view concerning the Civil Service, nor even Mr. Fuessle's, but to report the state of mind which is to be found in some, if not many, Washington officials.

With the exception of a letter from the United States Civil Service Commission, there is none of these letters that we can find room for in full; but in quoting from them we attempt to cover most of the important points.

UNITED STATES CIVIL SERVICE COMMISSION
WASHINGTON, D. C.

Commissioners

JOHN H. BARTLETT, President HERRBERT A. FILER, Chief Examiner
GEORGE E. WALES JOHN T. DOYLE, Secretary
HELEN H. GARDENER

IN the June 14 issue The Outlook printed an article entitled “Washington at War Over Civil Service,” by Newton Fuessle. The substance of the article is to the effect that administrative officers of the Government are hampered in their work by the present laws which regulate the Federal Civil Service.

There are certain inaccuracies in the article and evident misunderstandings which this Commission desires to correct. The Commission does not admit that the conditions of which Mr. Fuessle complains exist in marked degree; to the extent to which they do exist they are the result of interference with and failure to enforce the laws.

A typical case is described as that of an assistant secretary of a department who one day finds that his personal secretary is not on duty after office hours, when he wishes to give her certain dictation, and who on the next day is casually informed by the same clerk, “I sha’n’t be in to-morrow or the next day. I’m going to Baltimore to visit friends.” This assertion is supposed to be made without inquiry as to whether it would suit the convenience of the clerk's chief to have her absent at that particular time.

It is definitely within the power of an administrative officer of the Government to require his subordinates to continue at work after the usual office hours if the public business makes such action necessary.

Is it not a charge against the discipline of an office, rather than against the Civil Service laws, to state that the administration of the office is so lax that a clerk is permitted to absent herself at her pleasure, without regard for the wishes of her superiors?

This is a quotation from the article: “Many of these officials, coming from private business and professional careers into Government responsibility, confess that they find themselves bewildered, baffled, and fairly hamstrung by the insolence and indifference of

Civil Service employees, who consider that their jobs are life jobs and most of whom go about their duties with lazy inefficiency.”

Is that not an arraignment of departmental discipline rather than of the Civil Service system? If employees are insolent, indifferent, lazy, or inefficient, what is to prevent their discharge? It is just as much a part of an equitable merit system that inefficient and otherwise unsatisfactory employees be removed as it is that competent employees be retained, and a department head who fails to remove an inefficient employee fails in his duty.

The removal law requires that the person whose removal is sought shall be given a statement in writing of the reasons for the proposed removal, and that he shall have opportunity to make reply. Although the employee may make reply, the matter may end there if the employing department so rules. The decision rests with the employer. There is no further hearing unless the employing officer wishes it. The publicity in the matter is the safeguard against abuse of the power of removal. The employer must go on record and the employee may go on record, but the employer is the sole judge.

Mr. Fuessle missed the point here altogether. It is a fact that dismissals often are not made when they should be made. But the failure is not the fault of the law; it is due to interference with the operation of the law. Frequently when an unworthy employee is slated for dismissal he produces in his defense an array of influential supporters difficult to deny. It is this outside interference and the failure to stand against it that causes the trouble.

Comment is made in the article upon the alleged abuse of the privilege of sick leave. It is stated that “to take advantage of such sick leave one must present a doctor's certificate; but it appears that these are not very difficult to obtain.”

Is that not also a reflection upon departmental administration? It does not require clairvoyant power for an administrative officer to satisfy himself that an employee is abusing the sick-

leave privilege. Actual evidence is easily obtained. If an employee is suspected of deception, it is a simple matter to have a physician or nurse connected with the welfare section of the department call at the employee's home and make investigation. It is not unusual for this course to be followed.

Abuse of the sick-leave allowance is ample ground for dismissal. A department head failing to take disciplinary action in any such case clearly is open to censure.

In this connection it may be stated that, under the law, it is entirely within the discretion of the head of a department how much, if any, vacation leave, within a thirty-day limit, he will allow, and how much, if any, sick leave, within a thirty-day limit, he will allow. Under the law, a department head may curtail either vacation leave or sick leave, or deny them altogether.

It is said that “the present Civil Service laws and rules do not insure a reasonable return of effort for money paid out.” What the Civil Service laws and rules actually do is to select through competitive examinations, with much more care than is exercised by most private employers, men and women who have demonstrated their ability to perform the classes of work for which they are certified as eligible. All appointments are made for a probationary period. An employee may be dropped with little formality at any time during the six months' probation; and after that time he may be removed, through the procedure outlined, at any time, if his work or his conduct, *in the opinion of the employing officer*, is not satisfactory. The matter is one entirely within the judgment of the employer. His action is not subject to review by any one, unless there is charge with offer of proof that the removal is for political or religious reasons.

The conditions described by Mr. Fuessle, to the extent to which they exist, have nothing whatever to do with the Civil Service laws, rules, and regulations. Mr. Fuessle himself says that Commissioner Spry, of the General Land Office, is able “to cope effectively with Civil Service red tape. The Commis-

sioner has reorganized what was once a rigid and unwieldy staff into a flexible and competent organization." There are no special Civil Service laws and rules governing the employees of the Land Office. Mr. Spry works under the same Civil Service regulations that are said to hamper other administrators.

The Commission repeats that a department head who does not remove an employee who is insolent, indifferent, lazy, or inefficient fails to make good his oath of office.

The Commission requests that this letter be published in *The Outlook*.

By direction of the Commission:

Very respectfully,

JOHN T. DOYLE, Secretary.

FROM THE PULLMAN CONDUCTOR TO T. R.

Apparently it is not merely the new officials who come into Government service at Washington from business and professional careers who find themselves—to quote Mr. Fuessle's words—"bewildered, baffled, and fairly hamstrung." The Civil Service employee himself is occasionally repulsed by "insolence" or "indifference" that proves baffling, bewildering, and hamstringing. At least so seems to have been the writer of a letter from Washington which we print here in somewhat condensed form.

TUESDAY night of last week, as I entered a train at Flagstaff, Arizona, en route to Washington, I was reprimanded by a Pullman conductor because I inquired whether he could find me a lower berth and because I did not accept with joy the prospects of three nights' riding across the seething plains in a stuffy, hot upper berth, in a second-class car that pretended to give first-class accommodations.

For the benefit of all who were riding in the "smoker" he proceeded to give us his philosophy of life. He told us that "Americans have too much money." (Ye gods! A Government employee having too much money—just because he wanted to spend \$3 for a little better opportunity to avoid some of the alkali dust, heat, and smoke!) Then he proceeded to tell us a few things. "Look at me!"—and we had to admit he was a chesty specimen of humanity. "I am the president [or some exalted ruler] of the Pullman Employees' Union," etc., etc. "Money is no object in my life. I can wear diamonds" (and he certainly wore a sparkler). "I can wear silk shirts" (and he exhibited one which was of wondrous if not artistic design. Oh, yes, he had a "whole house full of them in Los Angeles").

And then, having introduced himself by way of these and sundry other remarks to show that he was a "Socialist" and "living for his fellow-workman" (just as though because my shirt was mended and because I wore no diamonds my heart could not be with my fellow-workers), he proceeded to explain "ma-

chine politics" as she is run in the great State of Illinois. The story is too long and too sordid to tell. Furthermore, I missed some of it by dropping into a reverie, thinking of the deluded notion that seems to prevail among some classes that only by displaying a silk shirt and diamonds can one imitate the "rich" and have at heart the interests of his fellow-man! His philosophy seemed to be that of creating an opportunity to let the other pig at the trough.

Annoyed and dumfounded at his little speech (and it was an eloquent one) addressed to all within hearing distance, but primarily to me, because I had the effrontery to ask whether a lower berth was available, all I could ask was, "What is your remedy for machine politics?" With a smile and a gesture he departed, saying these memorable words, "Civil Service."

And now, this morning, on my return to Washington, as I open *The Outlook* for June 14 (p. 308), I read with surprise of the "War Over Civil Service." Quite a write-up! It begins with what seems to be the wail of a newly appointed executive who apparently has not learned the T. R. art of ringing off visitors with a glad hand-shake that leaves them at the door wondering how it all happened, yet admitting that they had no right to intrude upon the Government's business. And then when he rings on his secretary at 4:31 P.M., he finds she has departed—probably to do her shopping before going home to cook her frugal meal and take care of a dependent parent.

WILLIAM W. COBLENTZ.

FLOUNDERING IN UNFAMILIAR DUTIES

Amusement over the helplessness of the official whose experience Mr. Fuessle cited winks at the reader from several of the letters of protest. This official, "inexperienced and somewhat dazed with his new duties," as Dr. Crook, of Springfield, Illinois, characterizes him, had spent practically all day seeing callers. Instead of finding fault with his stenographer for leaving him at closing time, or with the system for permitting her to leave, he should have organized his work. This seems the prevailing opinion concerning the official whose experience forms the text of that part of Dr. Crook's letter which we quote. Dr. Crook is the Chief of the State Museum at Springfield.

EMPLOYEES who are expert in their work and accustomed for many years to see newly chosen officials floundering in unfamiliar duties naturally show an independent bearing. On the other hand, the new official, like many new members of a school board or newly appointed church trustees or department heads, thinks that he should make himself felt, and, not knowing how to do it better, decides to show that he is a live wire by "firing and hiring."

What trouble there is with the Service comes largely from inexperienced heads of departments.

A. R. CROOK.

FACING THE FLIGHTY YOUNG WOMAN

One who has spent over half a century in the Government service, who has seen the improvement since the old days of corruption and has observed the effect of the war conditions which brought great numbers of young women hastily into work for which they were unfitted and at salaries higher than they otherwise could have got, can see the present situation in perspective. Such a one is the writer of a letter from which we make the following quotation. He agrees with the writer of the preceding letter that the chief of the division is principally responsible. He writes:

A good proportion of female clerks are (bless 'em!) everything a chief of division could wish, sensible, apt in comprehension, businesslike, and efficient. But there is a certain proportion which lacks these qualities, and there is no means of telling such individuals until they have been tested in the office. All clerks come in on six months' probation. If they are inefficient, saucy, or flirtatious, it is the business of the chief of division to discharge them. But few chiefs have the courage to say to a moral but flighty young woman, "You must go because by your behavior to the men you disturb the efficiency of this office."

In short, the efficiency of a division is what the chief makes it, and I believe this to be true in all such situations, Governmental or not. The variations of human nature are much the same everywhere, and respond in similar fashion to discipline or the want of it.

I may add that the debilitating climate of Washington from May to October and the extra cost of electric light in the winter months (especially in the dark, crowded, and ill-ventilated older buildings) render it very doubtful if there would be any economic gain by lengthening the hours of labor in the Government departments.

AN OLD CHIEF OF DIVISION.

"ON THE DOT"

Others higher up come to the defense of the subordinates in the Civil Service. Among them is one who for six years was assistant chief in the Office of Extension Work, United States Department of Agriculture. Part of that time was during the war. For the service of clerks who remain over time, work on Sunday, never shirking, never slighting their work, he believes the American people owe a debt of gratitude. In his letter he writes:

PROMINENCE is given to the fact that the clerks quit work on the dot, and this is featured with an illustration. There is nothing strange about this, or

nothing about this which is peculiar to Government service. It happens that here in New Brunswick there are several large commercial plants. If I happen to go by one of these plants in the afternoon about five o'clock, I find the employees pouring out like bees from a hive. Their official day's work is over; they are anxious to get out in the open, to go on a hike, or to care for the home garden.

This same thing is true with the Government clerks in Washington. They usually live long distances from their office; they have gardens or lawns to care for; many of them are enrolled as students at one of the universities of the District, and, sad to relate, many of them, after office hours, work to supplement the meager salaries paid them by the Government. They are expected to leave their office promptly at the close of the day's work. If they remain fifteen minutes over time, they are required to register before leaving the building. If any Government property is missing, then these clerks who have remained over time are likely to be called upon to account for the time and explain why they loitered around after the close of the day's work.

Without doubt it is the security of the position which seems attractive to a prospective clerk. It could not be the salary, it could not be the opportunity of promotion, and it could not always be because of the congenial heads of offices who must be satisfied. I doubt if a more efficient, faithful, painstaking lot of clerks could be found in any industrial organization in the United States than are found employed under the Civil Service in the departments at Washington.

L. A. CLINTON,

Director of Agricultural Extension.

Rutgers College,
State University of New Jersey.

RED TAPE AND ROUTINE

Another official, a chief clerk of the National Park Service, testifies that he has had several secretaries working for him directly and he is yet to find one who was not courteous, who did not have interest in the work, and who was not willing to stay long hours. He makes two interesting comparisons, moreover, between Governmental and commercial work. His computation of days' leave during the year leads him to the conclusion that they are practically identical for the commercial workers and Government workers except that Government workers do not have the occasional half-hours or hours or days that are commonly granted to employees in commercial houses. The other comparison he makes is between commercial and Governmental red tape. This is what he has to say about it:

CIVIL SERVICE red tape is charged with robbing young men of initiative. Well, there are a great many young men and women that get into the Service

that have no initiative to begin with, and they are quickly slated down to the ordinary routine positions, where they stay as a rule, but there are also routine employees in commercial houses without initiative.

I know of one large concern in New York City with which I did a large amount of business some years back, but for some reason or other they would not mark their shipments according to instructions in the orders, which caused not only a great deal of confusion at the receiving point but loss as well. They were finally told that unless they could comply with these instructions our business would likely be transferred to some other house.

I have come across a number of other instances of like nature. The only difference is that the commercial clerks are not adversely advertised by their employers, whereas the Government clerk is frequently the subject of a scathing report or statement by certain chiefs of bureaus who wish to abolish the system of appointments through the Civil Service.

B. L. VIPOND.

A QUESTION OF FACT

Several letters—among them the letter from the Civil Service Commission printed above—declare that Mr. Fuesle's correspondence misstated the facts concerning vacations and sick leave in general; but the specific reference to the employees at the Government navy yards, gun factories, naval stations, and arsenals has elicited correspondingly specific replies. Mr. Fuesle's statement that these employees are allowed a leave of absence of fifteen working days, from which absence on account of sickness is deducted, is perhaps most authoritatively denied in the letter from the Commandant of the Charleston Navy Yard, as follows:

GOVERNMENT employees at navy yards, gun factories, naval stations, and arsenals are divided roughly into two classes—"mechanics" and "classified IV 'C'." The latter includes draughtsmen, inspectors, clerks, stenographers, typists, messengers, etc. All employees are given thirty working days' leave annually; no leave can be taken until after one year of service. In addition to this, the "Classified IV 'C'" are allowed fifteen days' sick leave.

Also, compensation is allowed upon injury claims in case any employee is absent due to injury. It might be added that during the first service year leave is frequently taken without pay; this, during the second service year, can be made retroactive with pay, because an employee during his second service year is allowed thirty days for the first year and thirty for the second service year, or sixty working days with pay.

R. E. POPE,

Captain, U. S. Navy, Commandant.

United States Navy Yard,
Charleston, South Carolina.

SOME STATISTICS

In respect to this matter of leave of absence on account of vacation or sickness the Acting President of the National Federation of Federal Employees writes as follows:

A GREAT deal might be said also about the point of view of a man or a periodical which argues by implication for lengthening the working day in an age when a shorter working day is the standard, and which cites with approval deductions from the employees' pay for absence on account of sickness. In so far as taking advantage of regulations is concerned, the author of the Outlook article would have done well to inform himself from the records of the Joint Congressional Commission for Reclassification of the Civil Service, which records show that, although the annual leave allowance is thirty days, the average amount taken is only 27.2, and that, while sick leave can be granted on showing of a doctor's certificate, only three per cent of employees take that amount of sick leave, and fifty per cent take no sick leave at all. The average amount of sick leave taken is 5.4 days.

GERTRUDE M. McNALLY,
Acting President.

ORGANIZED FEDERAL EMPLOYEES

With reference to this body popularly known as the Federal Employees' Union, the Secretary of Local 25 of that body writes as follows:

YOUR correspondent refers to the Federal Employees' Union. The official name of that organization is the National Federation of Federal Employees. It embraces employees in all departments of the Federal service exclusive of the Post Office Department. I feel that it would have been profitable for your correspondent to interview the National officers of the Federation at Washington. This "union" was organized to secure "the united efforts of all employees toward the betterment of the Government service . . . and to promote the welfare of its members." Its constitution forbids violation of any Federal statute or interference with the business of the United States; and under no circumstances shall the Federation "engage in or support strikes against the United States Government."

The caliber of the Federation, which embraces all classes of employees, including the scientific and professional grades, is indicated by the recent concentration of its efforts in favor of the passage by Congress of the so-called Reclassification Bill, which is supported by the United States Chamber of Commerce, the American Federation of Labor, the National League of Women Voters, and other organizations of National scope. This bill, incidentally, reduces the permissible amount of annual sick leave from thirty to fifteen days. In general the bill provides for a reclassification of all Civil Service positions outside of the Post Office Depart-

ment (which has already been reclassified) and the establishment of a modern employment policy for the Federal Government.

A. W. STOCKWELL,

East Boston, Massachusetts.

Secretary.

THE INEFFICIENT SPOILS SYSTEM

Passing by the interesting but not directly pertinent protests recorded against the inadequacy of salaries paid to Government clerks, we close this report of the response which Mr. Fuessle's correspondence evoked by reporting some of the remarks in which conditions under Civil Service regulations are contrasted with those under the spoils system. One writer, Secretary Stockwell, from whom we have just quoted, cites the "practically unanimous testimony of administrators before and since the day when Theodore Roosevelt was one of the United States Civil Service Commissioners, in favor of the merit system and against the spoils system." Three branch presidents of Federal Employees' Union No. 2, Washington, D. C.,

jointly deplore Mr. Fuessle's correspondence because they allege that "its effect is to give aid and comfort to those who would discredit the 'merit' system with the end in view of a partial return, at least, to the old 'spoils' system." When President Cleveland extended the Civil Service he blanketed in those already in the service. In addition to these there are those who are in office in consequence of political appointments which are made from one Administration to another. This point is made by a former Civil Service employee, who writes from Montana. "There is a sort of double incubus over the real qualified employee who is doing the work. Is it any wonder, therefore, that he becomes philosophic," inquires the Montana man, "when he sees that there is absolutely no future for him and that his salary is paid out to others who are not earning it?" And another writer who writes from Washington makes the following interesting comparison:

Side by side in Washington are two illustrations, one of the "spoils" system, the other of the Civil Service or "merit" system. At the Capitol, where the former flourishes in full vigor, the endeavor is to crowd onto the pay-roll the largest possible number of names, and at as generous salaries as the public will stand. In the executive departments, where the Civil Service principle prevails (albeit thwarted to some extent), there is ever present the endeavor to abolish unnecessary positions and to institute economies. This statement must be qualified to the extent of excepting bureaus and services of "war-time" creation. In these, at least to a considerable extent, "war-time" salaries and expense accounts prevail.

GEORGE A. WARREN.

No one denies that there are defects in the present Civil Service system. For the most part these defects, it is widely believed, can be removed, or reduced, by the enactment of the Sterling-Lehlbach Bill now before Congress.

THOSE WICKED CHINAMEN

BY MARIA MORAVSKY

THERE is a type of short story, quite popular in this country, which may be classified under the general title "The Heathen Chinese."

Every one of my literary friends has one or two of them among his earlier efforts. Magazine issues are not complete without a picture of a flat-nosed villain dropping poisonous powder into some one's last cup. As to the "movies," they would go to speedy ruin were it not for "Dragon's Claws," "Mandarin Loves," and the like.

The fictitious Chinaman in the States is always more or less a sinister figure. It is he who smuggles the white slaves into the country under the ingenious guise of tea packages. It is he who sells drugs to young millionaires when they are innocently eating chop suey. It is he who—but what is the use of enumerating all his crimes? You saw them all on the screen.

When I came to this country and saw the Chinaman painted in such dark colors, I was greatly surprised, even alarmed. I had often met with the Chinese citizens of Manchuria, which after the war of 1904 became a Russian province, and these quiet, law-abiding, hard-working, extremely honest people never once struck me as being romantically wicked. I dined in their restaurants, discussed things with their *intelligentsia*, bought silk from their wandering merchants, drank their "Dragon's Whiskers" tea. And not one dangerous meeting! Well, I thought, there must be something in the American air which develops the potential criminal instincts of the "heathen Chinese."

After seeing many a yellow menace

"movie" I was even afraid to intrust my laundry to a Chinaman. I dreaded Chinatown. I shuddered at the mention of Chow Mien.

But not now. After my five years of studying America that romantically dreadful illusion was shattered, together with many another. The "heathen Chinese" lost all his criminal splendor. He became, like any other foreigner, for the most part a poor, ignorant, hard-working thing, competing more or less successfully with the higher-paid American laborer.

Sociologists say that here lies the main reason for hating the yellow man—his lowering of wages. But there is also another reason, a psychological one, which makes him in your eyes a mysterious criminal—his extreme reserve.

We all are sub-consciously afraid of silent men. They affect us like silent danger. Especially if they happen to come from a distant country of which we know but little. It is the primal instinct of self-preservation which urges us always to suspect the unknown, be it food, animals, ideas, or other human beings.

In Russia we did not fear Chinamen, because they did not come to us from abroad. On the contrary, the Russians invaded their territory, conquered their aristocratic province, made its population subjects of the Czar. We seldom fear our inferiors, and Chinamen seemed to the Russian masses infinitely inferior, since they were defeated.

Here, Americans also assume superiority to the yellow men. But, as the Chinamen are not under your political protection, there always lurks in your contemptuous attitude toward them the

fear of the unknown, the elusive, the strange.

If you knew the Chinaman's soul, you would stop romanticizing about him. The yellow man would become for you just a differently colored human being, with rather peculiar traits of national character, but without that terrible radiance of mysterious evil which fascinates the "movie" audiences. Unfortunately, great masses of Americans are interested but little in any country besides their own.

I say "unfortunately," because the friendly curiosity toward other nations is a powerful factor of civilization. It replaces the ancient fear of the unknown with the desire to study it. And it is a widely recognized truth that we hardly can hate anybody whom we know well.

If I had no pity on the "movies," I would recommend you to meet with Chinamen socially. Some of them are highly educated, know English to perfection, and, when treated properly, they often throw aside their Oriental reserve and become entertaining and cordial companions. They may teach this young nation of yours the wisdom of their ancient civilization. Their main national trait is honesty, as most travelers state. So you need not be afraid to trust a Chinaman with either your laundry or your friendship.

But if the mysterious yellow villain changes into a friendly foreign visitor, what will become of the chief "movie" stunt? How can I attack the beloved theme of the photoplay writers? No! For the sake of the moving-picture tradition, let us preserve the holy fear of Chinamen.

OLD WARS AND MODERN WAYS

(C) Harris & Ewing

GENERAL BUTLER, PRESIDENT HARDING, GENERAL PERSHING, AND
GENERAL LEJEUNE IN FRONT OF THE CANVAS "WHITE HOUSE"
ERECTED BY THE MARINES ON THE GETTYSBURG BATTLEFIELD

P. & A. Photos

MARINES MOVING TO THE ATTACK OVER THE HISTORIC WHEAT-FIELDS OF GETTYSBURG

The Marine Corps staged a double reproduction of the famous battle which marked the high tide of the Confederacy. The first battle was a presentation of the conflict as it was fought in Civil War times. The second presentation showed the battle as it would be fought to-day, with modern means of attack and reconnaissance. Tanks advanced over the fields where Longstreet charged; airplanes hovered over the historic lines on Cemetery Ridge. The maneuvers took place on July 1, 3, and 4

BRAZIL'S BIRTHDAY PARTY

Photograph by Ewing Galloway, N. Y.

These two views show the site and the surroundings of the great Centennial Exposition which Brazil is planning for the coming year. The upper picture gives a panorama of the Bay of Rio de Janeiro at night. It is taken from the top of Mount Corcovado. The lower picture shows the site of the Exposition and is taken facing towards Mount Corcovado, the tip of which appears over the hill in the background. The dome of Monroe Palace appears at the extreme right; the monolithic monument marks the junction of the Avenida Rio Branco and the Avenida Beira-Mar. The West Gate to the Exposition will extend across the Beira-Mar just west of the palace grounds, as shown by the trees to the right of the monolith. The North Gate will be to the right between the low building shown and the Monroe Palace. At the left is Gloria Hill. A portion of the bay shown in the photograph is to be filled in by earth from the Morro do Castello, now in process of being demolished. The new Gloria Hotel is shown in the extreme left. The ground between the low, long building marked "3" and a straight line drawn from shed "1" to the monolith will be parked. The Avenue of Nations is to be at the left of the shed "1," which is in the street, and will merge with Beira-Mar at the monolith. The bay from the shore to boat marked "4" is now being filled in for a great public park which will extend in a curve following the present shore-line from shed marked "5" to the Gloria Hotel

Underwood

THE RIGHT TO WORK

BY KINGSLEY MOSES

A PUPIL OF THE JEWELRY CLASS (SHRIVELED LEFT ARM)

THE idea that crippled or physically disabled men and women have a right to profitable employment and an active share in the affairs and pleasures of the world is a conception comparatively new.

Within the memory of the majority of us it was a fact taken for granted that unfortunates injured in industry or disabled by illness must simply drop out of active life. The future of these unfortunates was nobody's business or particular concern; they were simply swept aside. For such of them as happened to have kindly disposed relatives the future was one of supine and more or less uncomfortable dependence; for such as had no kin—well, there were almshouses.

True, so far as financial relief alone was involved, there was in many cases recourse to the law; as, for example, if the employer had been criminally negligent. But the law is often tardy, always expensive, and sometimes oblique in its judgments, and the poorer folk generally have little faith in its workings. But in many other cases there was, under the prevailing industrial code, no ground for

appeal. In cases of illness not directly to be traced to the invalid's daily employment the situation was entirely and pitifully hopeless.

So these discards of society were shunted aside to provide for themselves as best they might. The world moved on and left them helpless, unable to engage in active labor, ignorant of methods by which they might fit themselves for other lines of endeavor, and, worse than all perhaps, filled with bitterness and resentment against a human system that tolerated such conditions. In their own hearts they were thwarted, miserable, and unhappy; and their attitude was naturally reflected by their families. If only from a practical and economic view-point, it was a bad business.

This particular problem has long been realized and agitated by social workers; but, unhappily, the attention paid to social workers—more or less as a result of the sentimentality of the workers themselves—has been rather desultory and spasmodic. There were so many other things to do. So until the close of the war the movement had generally small impetus

A few cases will illustrate the problem.

A young railway worker in Syracuse, New York, lost his foot in an accident. The boy was paid his legal amount of compensation by the railway. He attempted to develop himself into a singer, since his experience in the local church choir encouraged him to believe that he might make a living by his voice. But voice training is a long and difficult routine. The boy spent his compensation award, and was still unable to cash in on the value of his musical accomplishment. What then?

A coal miner, forty-two years old and illiterate, lost his leg. He had a wife and several children to support. All his life had been spent in and about the mines. That was his world. Naturally, it was not supposed that he could carry on underground, and he was not mentally keen enough to be fitted for any other work. This man's future, then, was not promising.

In New York a young girl of seventeen was an expert in the manufacture of silk lingerie. In a fall she injured her elbow severely, and an X-ray, tardily taken, disclosed an ugly fracture. Careless treatment resulted in a new formation of bone that prevented her bending her arm. She was no longer able to operate her machine.

Martha Kern, as we shall call her, was at eighteen a lifelong cripple from infantile paralysis. She was confined to her home, and even there could get about only on crutches. There seems small chance for a girl with that handicap.

Bessie Young—again for obvious reasons the name is fictitious—had also been a paralytic. She was a rare case; she had the courage to try to earn a living despite her affliction. But training in millinery work had left her unresponsive and uninterested. Again, fond of children though she was, work as a nurse-girl in private families irritated her nervous condition and made her a not desirable helper. She seemed, through the very misfortune of her condition, barred from lucrative and congenial employment.

Another young girl, whose leg had been amputated, began to brood upon her condition, which, as she thought, barred her from the companionship of young people of her own age. She was acutely sensitive about her artificial leg and extremely loth to go out.

Even more difficult was the case of a man adjudged ninety per cent disabled from terrible burns received in a chemical plant explosion. He was absolutely bald; all his hair had been charred away. His left hand was weakened, his right hand so shockingly deformed that he could only grasp articles as one uses a pair of pincers. His face, as a result of the burns, appeared repulsive. It seemed

impossible for him to find employment. People shrank at the sight of him.

Yet in every one of these cases, through the activities of the men engaged in the work of industrial rehabilitation, a remarkable cure or a material improvement has been effected, and the disabled persons have been restored to profitable and pleasant occupation.

In June, 1920, Congress passed a bill providing for the promotion of the vocational rehabilitation of persons disabled in industry or otherwise and for their return to civil employment. Thus Congress recognized the importance, entirely aside from a Christian or humanitarian point of view, of conserving the country's human resources. People, human beings, were at last to get as much attention as barren tracts of land—for reclaiming useless acres that may prove valuable has long been a worthy and profitable real estate venture.

So, successively, the United States has officially indorsed and provided for: first, vocational education as a regular and normal training for all citizens; second, the obligation to rehabilitate and re-establish its disabled soldiers in civil life; and, third, the conservation of a class which greatly outnumbers our war wounded.

Recognizing the fact that the several States must take a direct financial and intimate interest in this work, Congress wisely provided that a certain sum should be set aside each year for the promotion and maintenance of the project; and that of that sum there should be allotted an amount to each State equal to the amount raised by the State itself. For example, New York provided the sum of \$75,000 and was entitled to \$75,000 more from the Federal Government. In this the Nation has had the co-operation already of more than thirty States of the Union, with the others slowly beginning to follow. California, Indiana, Minnesota, Mississippi, New York, and Pennsylvania are already conspicuous for their activity.

The procedure followed in treating the cases which come to the attention of the State boards is, briefly, first, to determine so far as is possible what the real trouble is with the applicant, and then to discover for what available work the disabled person may best be trained with expectation of reasonable success in that vocation. Very frequently nothing more than a little moral encouragement is needed, and the consequent exercise of the Board in finding the person work. In the cases of the two apparently helpless cripples (the coal miner and the girl embarrassed and self-ostracized on account of her artificial limb) there was, as a matter of fact, no treatment necessary save a little moral bucking up. Taken back into his former employment by the mining company, the middle-aged workman soon learned to get about with almost his old-time agility. And the girl, encouraged privately to dance, discovered that the slow

PUPIL IN TYPEWRITER REPAIR CLASS (HUNCHBACK AND PARALYTIC),
INSTITUTE FOR CRIPPLED AND DISABLED MEN

shuffling which to-day passes as dancing was quite within her powers, took heart, made friends, and is now cheerfully employed as a saleswoman in a pleasant music store.

But in the majority of cases there is a much more serious problem. The sick person has to be cured first, then trained, and finally placed in the right sort of employment.

Too great emphasis cannot be placed upon the latter function of the various boards. Had the young man from Syracuse whose foot was gone been encouraged to persist continuously with his singing, it is extremely dubious whether he could ever have succeeded. Morbid at being a continual drain upon his family and the State, he might easily have lost courage. But, instead of that, when, after training at a barbers' school, he secured profitable employment in that trade, and continued his singing lessons at night, it is easily possible to foresee that he can go on to ultimate attainment.

Then, again, careful scrutiny of the patient's preferences must be given. A hated task is a hard task, badly done. The silk lingerie worker referred to previously loved that sort of labor. Having discovered so much, the Board insisted on treatment for her arm that would return her to the work, where she is now, once more, a success.

The girl we call Bessie Young, who through nervousness resulting from her ailment could not be interested in millinery manufacture or tolerate the exactions of service in a private home, was made perfectly content by employment in a regular day nursery, where at the same time she could exercise her fondness for children and be assured of regular hours and wages. Martha Kern, on the other hand, almost bedridden and incurable invalid though she was, took to millinery work eagerly, and is now not only taking private orders but turning out material for a wholesale house as well.

It is very largely a question of the individual and of careful study of each individual. In the case of the man horribly disfigured from burns neither a return to the old work nor training for some related work was feasible. He was reluctant to mix with his fellow-men because of his appearance; particular and, in a sense, unique occupation had to be hit upon, and then opportunity to engage in that work discovered. Yet even this the Board did, settling the man happily at last in the country, where, with the inheritance of a love for gardening, he was established as a raiser of flowers, which through the co-operation of his wife and young son he was able to sell profitably.

This is the sort of thing that the Rehabilitation Bureaus are doing in those

INFANTILE PARALYSIS CASE TRAINED TO MILLINERY WORK

States which have actually accepted the plan and begun the work. Getting the sick person a job, after first curing him (or her), and then keeping him in the job by co-operation with his employer—that is the foundation of the effort. There is of course much more. Artificial limbs are furnished when necessary; all the required training is given—in some cases even cost of maintenance is paid weekly during the course of training; but most important of all is the choosing carefully of the right type of employment. Without close and intelligent attention to the needs of every applicant all this work might be wasted and profitless. And, sadder even, the roused hope of the sufferer might be dashed so that his subsequent condition would prove more miserable than had been his plight before commencing training.

The Workmen's Compensation Laws, formulated gradually by most of our States and inaugurated in 1912 in those

widely separated localities, Arizona and New Hampshire, quickly followed by Connecticut and New Jersey, provide compensation generally for death or injury resulting from industrial employment, and in the case of injury stipulate the sums payable according to the nature and extent of the incapacity.

But, as Mr. Frederic G. Elton, district director of the work in New York City, points out:

"It is of course pretty generally admitted that compensation does not compensate for an injury; in fact, there is always the danger of destroying the character and work habit of the individual. In making provision only for a monetary consideration to its injured workers the State is not recognizing that the workers are human assets, and that injured workers, like idlers, are liabilities, the maintenance of which devolves upon the State and society.

"Primarily it is necessary to preserve

this contribution and not to permit its decrease. The mere payment of a monetary compensation does not do this. While it may temporarily relieve the individual, it often robs the State of a percentage of the aggregate effort of its citizens, and, as this percentage grows, retards the progress of the State and Nation. Therefore, since it is economically necessary to the progress of the State that the man power be maintained, it would seem that it is an obligation that the State owes to itself to see that each individual when injured is physically and vocationally rehabilitated as far as it is possible, and returned with the least loss of time to his proper place as a worker."

This is the scientific, economic aspect of the endeavor. Its consequences and possibilities are no less important. In this day of turmoil and in too many quarters in America as well as Europe of violent class hatreds, it is an ill thing to have in any community such bitterly disappointed and thwarted lives as must be the result of negligence in the care of our sick and crippled. The misplaced sympathy of well-meaning friends, self-pity, and ignorance too often turn the crippled man or woman into the devious roads of radicalism. Over-introspective, like Hamlet, they begin to hate themselves and their own maimed and futile bodies. And that hate, like poison gas, spreads out through their immediate families, their friends, and the whole neighborhood. They hold their late employers, their fellow-citizens, the whole of society at large, responsible for their own ailments and misfortunes; and their bitterness inevitably breeds bitterness.

That the movement now so generally adopted and sponsored by the several States as well as by the Nation is appealing to the academic as well as to the business mind is evidenced by Harvard University's inclusion in its summer course this year of a study of rehabilitation, under the joint direction of the University, the National Tuberculosis Association, the American Occupational Therapy Association, the Federal Board for Vocational Education, and the Committee for Mental Hygiene.

The Bethesda of complete physical cure is not always, in this twentieth century of ours, practicable or to be dreamed of; but the peace of mind that has its source in active and agreeable occupation seems certainly to be within the reach of those who have so greatly suffered.

THERE ARE OTHER THINGS BESIDES WRECKED BODIES IN THE WAKE OF MODERN INDUSTRY WHICH NEED REHABILITATION. SOME OF THESE THINGS THE WORLD OF INDUSTRY HAS SET ABOUT MENDING OF ITS OWN INITIATIVE. FOR INSTANCE, BUSINESS ETHICS.

"CLOSING IN ON COMMERCIAL BRIBERY"

IS A FORTHCOMING OUTLOOK ARTICLE WHICH TELLS OF THE PROGRESS WHICH IS BEING MADE TOWARDS THE ELIMINATION OF EVIL TRADE PRACTICES WHICH A FEW YEARS AGO WERE ACCEPTED AS INEVITABLE.

FOR MAISTER GEOFFREY CHAUCER

BY ROBERT HILLYER

A BARD there was, and that a worthy wight,
Who from the time that he began to write
Served God and Beauty with an humble mind.
And most of all, he knew and loved mankind.
Laughing he was, and quick at many a jest;
The Lord loves mirth,—the devil take the rest!
A simple grace ere wine was poured at dinner.
A ready hand outstretched to saint and sinner,
A prayer at times, not lengthy but devout.—
This was our poet's faith without a doubt.
Travel he loved, and wonders had to tell
Of royal France and Italy as well.
And everywhere he went, his furtive pen
Took down the secrets of his fellow-men.
Their faces and their sores, high and low,
From lordly Petrarch and Boccaccio.

Under the meanest villain who could find
Some tavern audience with the tales he told.
Yet with his scribbling, he never strayed
From duty to King Edward, whom he served;
And though he roamed both France and Italy,
England was where he ever longed to be.
And loathed he returned with magic spells
That England might have pleasure of his spells.
And hear his brave chivalric stories sung
By English pilgrims in the English tongue.
Noble his spirit was, and gay his heart;
A judge of wine, a master of his art.
He loved all men, nor was ashamed to show it:
He was a very part, gentil poet.
Gentil in life, and parfit in his rhyme,—
God send us such another in our time!

WHY GERMANY FAILS TO PAY

BY JOSEPH DANZIGER

A REFEREE in bankruptcy is constantly called upon to determine whether the bankrupt is willing but unable, or able but unwilling to pay his debts. In arriving at a decision the referee must decide, not only on the financial data at his disposal, but also upon the moral attitude of the bankrupt towards his debtors.

Germany comes to the court of nations pleading insolvency. In attempting to arrive at some standard for judging her ability to pay at least a part of the reparations her political tendencies as well as her economic potentiality must be considered. There are three distinct political currents in Germany, each directed in a separate channel. To the left is a considerable portion of the population which admits the national obligation to pay for deliberate damage done by German militarism. The middle course, representing probably a majority of the population, waives all discussion of moral obligation, but accepts reparations as inescapable. To the right is the channel that offers resistance to any payments under all conditions. It is composed of small but tremendously powerful interests, agrarian as well as industrial and financial. The men who represent this tendency merely wish to do nothing, to pay not a single mark they can evade paying until *der Tag* when America, England, and Japan become involved in a tripartite war. Germany, they say, will then have the opportunity to settle with France alone, and they will fall upon their old western enemy hip and thigh. In the meantime they conceal arms on the landed estates, retain private organizations of armed soldiers more or less secretly, but in public they talk, plead, and stall to gain time and evade any permanent settlement of the question.

Although this latter tendency is not representative of popular opinion, it is powerful enough to obstruct any genuine reconstruction of Germany's internal finances. It is the work of those who seek to make even a partial reparations programme an unworkable proposition. Besides the Junkers, to whom war is a popular game and their social and political privileges the only purpose of society and state, the big financial and industrial interests are equally bent on a policy of immediate inaction. At the head of this aggregation is Stinnes, the coal baron, a silent, saturnine figure, who never appears in public, never expresses a personal predilection. He owns seventy-six newspapers, of every conceivable political complexion from monarchism to single-tax, all of which are unanimous in their pro-Stinnes attitude toward reparations. His rather shabby office on Budapeststrasse is the radiating center of more driving power than issues from the Reichstag's building. Stinnes is not only absolute dictator of the People's Party, but also a powerful influence in the Center Party. His representative in the Cabinet is Hermes, officially a member of the Centrists' party, but in reality representative of special interests in the amorphous conglomeration known as the Wirth Government. In Greek mythology Hermes was messenger of the gods, titular deity of thieves and merchants; in the German Cabinet Hermes is Minister of Finance and spokesman for Stinnes.

Rathenau, Foreign Minister, represents the financial group opposed to the Stinnes interests.¹ He is a member of the Democratic Party, a small clique of

Berlin business men. One day, when the Wirth Cabinet faced one of its frequent crises, Rathenau visited the Chancellor, demanded his immediate appointment as Foreign Minister or the Democratic Party would refuse to co-operate further with the Government. The appointment was published that very day, and the Democratic Party stuck.

Wirth himself seems to be honest enough. He knows what is needed for a reconstruction of internal finance, but he can only rely on the Social Democrats and the left wing of his own party, the Centrists. All other factions in the heterogeneous coalition oppose any efficient methods for financial reform. Under these political distractions an annual budget deficit is inevitable. It increases from month to month, and the proposed remedies are mere temporizing patches which will ultimately aggravate the evil. The first essential to reparations payments is that Germany shall set her own financial house in order; but to do so would eliminate a conspicuous and specious objection to payments. For this and other reasons that will be referred to later, dominant interests reject all programmes for effective financial reform.

THE ALTERNATIVE WHICH GERMANY FACES

THE German Government can pay no greater amount than it collects from the nation, but if the Government is controlled by interests that refuse to pay even enough to support running expenses the effect on reparations payments is obvious. Every student of economics has had the ancient witticism thrust upon him at some time, that there are only three ways of acquiring wealth: earning it, receiving it as a gift, or stealing it. Conversely, there are three methods for Germany to meet

¹ The appointment of Rathenau as Minister of Finance was a surprise, as he had previously been Minister of Commerce and was widely known as a member of the Democratic Party.

reparations payments: either with gold or its equivalent, with goods delivered to the devastated regions to supplant wealth destroyed in the war, or with direct labor values.

The last-named form of payment is the most primitive. French Syndicalists have declared their willingness to welcome German comrades on the former battle-grounds of northern France and co-operate with them in a common effort to rebuild the ravished departments. The French Government, however, will not listen to this plan, so that payments in direct labor values are eliminated. At best it would be complicated by the amount of good will exercised by the German Government and the readiness of the imported German labor to render value received. As human nature is constituted, it would be a dubious proposition.

There remains the alternatives of payment in goods or in gold or its equivalent. Economists, as distinguished from politicians, are pretty well agreed that the forty billion gold marks which Germany has agreed to pay as indemnity for war damages is the ultimate amount which can be reckoned on at least during the present generation. The additional sixty billion gold marks to reimburse the Allies for the cost of the war is too conjectural an amount to be worthy our serious consideration. The German gold reserve, amounting to about one billion gold marks, is now held at the disposal of the Reparations Commission and amounts to less than one annual interest payment of three per cent on the capital charge of forty billion gold marks. So then, as Germany does not possess the gold to pay reparations, she can only pay by means of a favorable trade balance. That is, if the national capital should not be impaired for the purpose of meeting reparations payments, Germany must export more goods than she imports. Otherwise, she must sell her capital assets, such as lands, houses, factories, or stock certificates. During the last two years much foreign capital has gone into Germany for such purchases, establishing balances abroad. The result has been that reparations were paid out of the sale of capital assets, and not from current earnings. This method of paying obligations is sure to prove disastrous to the future economic stability of a nation, as it would be if a business man sold his capital assets to pay a current loan at the bank.

It would be a less serious matter if these assets were purchased at gold values, but such is not the case. I know of a twenty-one-flat building erected with modern improvements just before the war that was sold to a Spaniard for the equivalent of about one thousand dollars, a much smaller sum than the replacement cost of the bricks. The building is located near a subway station in a new high-class residence section, and the low price was possible because of the low rate of exchange.

Germany has had an unfavorable trade balance since the close of the war. Immense quantities of raw materials, especially food products, were imported as soon as the blockade was raised. Hides and textile fibers were also required to fill the utterly depleted stocks. To a limited extent this demand has now been satisfied, at least for immediate and imperative needs of the population, for the average German does not possess his pre-war purchasing power, and is compelled to buy fewer and cheaper clothes, to eat less expensive food, and has nothing at all for imported luxuries, like California fruit or real coffee beans. Imports are therefore restricted to indispensable necessities for home consumption, and other raw materials are intended to be worked up and exported.

The year 1921 closed with an unfavorable balance, but this has gradually diminished from month to month. The value of all imports and exports for the last three months of the year were:

	Exports (Marks).	Imports (Marks).
October	9,711,508	13,875,052
November	11,911,874	12,277,894
December	14,554,071	13,706,573
Total for six months	66,585,819	78,526,140

While the unfavorable balance averages almost two million marks per month for the last half of the year, it was reduced to 366,000 marks in November, and December exports exceeded imports, disclosing a slight favorable balance. An analysis of these figures discloses that, while the value of imports did not vary materially, the total tonnage decreased from month to month. Over two-thirds of all imported values for the six months ending January 1, 1922, were foodstuffs. The value was about the same for November and December, but the tonnage for the latter month was two-thirds that of the former. The contrary is true of exports. During the last quarter of the year the tonnage was constant for each month and the value increased as shown above. This is partly accounted for by the constant drop in the mark, but is more essentially due to shifting economic conditions. As agricultural productivity increased foodstuffs were imported in lessening quantities, whereas the value as well as the quantities of textile and metal exports has been rapidly increasing.

REPARATIONS IN KIND

THE essential deduction to be drawn is that as German agriculture recovers its pre-war productivity and business connections abroad are restored Germany can be expected to slowly convalesce and ultimately re-establish her favorable balance of trade. When this is done, but not until then, she will be able to make cash payments for reparations on a sound economic basis without disturbing the welfare of other nations. This is the contention of Sir Robert Horne, British Chancellor of the Ex-

chequer. Sir Robert's assertion is eminently correct, provided Germany can be induced to set her internal finances on a sound foundation. In the Wiesbaden Conference Germany agreed to pay seven billion gold marks in goods during the next five years. The method adopted by Belgium should be a model for France. A Belgian manufacturer requires a million francs' worth of machinery to restore his destroyed plant. He secures bids in the regular way from both Belgian and German sources. If he decides to place the order in Germany, it must be approved by the Belgian authorities after they have assured themselves that prices are acceptable. The Belgian is not required to make a direct payment. The German vender sends his bill to his Ministry of Reparations and is paid in paper marks. The value of the invoice in gold marks is credited to Germany by the Belgian reparations officials. This method permits absolute freedom of action to vender and purchaser, the two interested Governments merely acting as bankers in the transaction. The same method can be applied to building materials, and even to the actual construction of houses if the French Government would admit the introduction of German labor.

Cash payments would necessarily entail a roundabout and economically wasteful process. Germany would have first to establish a heavy export trade in order to obtain an adequate favorable balance. In other words, German labor, instead of making good the damage caused by German militarists, would be forced to compete with, let us say, American labor, and at a wage far below the American margin of subsistence. If gold payments are insisted on, Germany will be in a position to meet them within the next five years, but the result will be disastrous to our exports of raw materials to Germany and finished products to other foreign markets. For if the German export balance is chiefly used to pay reparations there will be nothing left to buy commodities required for domestic consumption.

So far as we are concerned, cash indemnities will be a double disadvantage to us; on the one hand, it will expose us to competition with industries that procure skilled labor at fifty cents and less per day; and, on the other, it will limit the purchasing power of an excellent pre-war customer to the barest and most indispensable necessities.

There is no essential economical obstacle to reparations in kind. On the contrary, while cash payments would cause unemployment in competitive industrial countries, payments in kind would have the reverse effect. They would restore the productive potentiality of an important section of western Europe and create means of employment for inhabitants of the most valuable mining and manufacturing districts in France. Reduced to its lowest terms, it would mean that Germany would have to support not more than two million

men while they were engaged in recreating wealth which had been destroyed in the war. If Germany could support eight million men during nearly five years of war and blockade and furnish them with the most efficiently constructed instruments of destruction, then she can surely support two million men engaged in the arts of peace, especially as she would no longer be inhibited by a blockade nor have to support a large army, but she could trade with all the world and when the time came join the other civilized nations in the economic rehabilitation of Russia, her natural hinterland.

OFFICIAL GERMANY OBJECTS AND HOLDS TO
A POLICY OF RUIN

THE only objections to this just, practical, and simple plan for the restoration of willfully destroyed wealth have been raised by official and industrial Germany. The objections are specious and futile. They will not stand the light of economic analysis. Therefore it is next to impossible to secure the desired data. Men at the helm confine themselves to platitudinous statements that contain no convincing facts and which a supine German press repeats without question. They decline all interviews with foreign correspondents. They fear the incisive inquiries of trained American journalists, as any foreign correspondent in Berlin will testify. Not only that, but official statistics which are available to all and sundry in Washington are carefully secreted in Wilhelmstrasse. When I requested certain statistics essential to the preparation of this article, I was blandly informed that Herr Rathenau had taken them home with him to study out a statement for the Genoa Conference. A Councillor in the Foreign Office replied to my protest: "Why, if we published all the facts in our possession our enemies would know as much as we do."

The statement of Walter Rathenau at Cannes that reparations payments are responsible for the fall of the mark is a good example of popular sophistry. Reparations have in no case been paid in paper marks. No sane banker would accept them as a permanent form of investment, although thousands of German-Americans have been induced to buy marks—the actual currency in most cases—in the expectation that they would eventually be restored to their gold value. Aside from this comparatively small item, reparations are paid by exporting gold or some other form of wealth or by the sale of capital assets.

An acquaintance of mine bought a fine country house in South Germany about a year ago. He paid \$2,500 for it, or a quarter of a million paper marks at the current rate at that time. He gave his check for the price in dollars. His New York bank then credited the German bank with \$2,500. This credit was turned over to the Reichsbank in exchange for its equivalent in paper marks, which were transferred to the

"ONCE upon a time gold was one of the splendid things of life, a lesser brother of the sun. It glittered on statues and furnishings, on pictures and books, tables and altars, on uniforms and bridal clothes, on the heads of kings, and about the brows of saints; it caressed the necks of women and encircled the arms of men."

So writes

GUGLIELMO FERRERO

in an article entitled

"GOLD IS DEAD"

It is not a fairy story, even if it begins "Once upon a time." It is an eloquent interpretation of one of the great dramas of the progress of civilization. The article will appear in a forthcoming issue of The Outlook.

seller of the property. The Reichsbank then used the New York credit of \$2,500 as part of the next reparations payment.

The pre-war value of the property referred to was 100,000 marks, or about \$25,000. The purchaser bought it in this case because he could get it for about one-tenth of its pre-war value in dollars. This process has been repeated to the extent of billions by English, Scandinavian, and French investors in real estate and industrial values. Foreign credits were thus amassed and reparations payments met with them. If it were continued indefinitely, it would result in all German wealth being acquired by aliens. However, it cannot be continued indefinitely. For every foreign investor there are hundreds of Germans who profit by the present chaos to concentrate wealth in a few hands. Stinnes is a well-known example of this type.

To say, as Rathenau did, that the sale of capital assets abroad had an influence depressing the value of the mark assumes profound economic ignorance on the part of his listeners and is as logical as it would be to assert that a horse walks up hill because he is pushed by the cart behind him. The mark is worth a small fraction of its gold value because there are so many in circulation. A graph showing the rate of dollar exchange in marks for the year 1921 describes an almost parallel curve with the inflation of Germany's floating indebtedness. This mainly consists of treasury certificates deposited with the Reichsbank as "security" for additional currency. But, as the security is worth no more than the Government's ability to pay, its value is reflected in the number of marks required to buy a perfectly stable dollar. When the Government

finds that its revenue is insufficient, it issues treasury certificates to balance the deficit. These are used as the basis for further inflation of the currency, and as a result the purchasing power of the mark is reduced still more. Prices of labor and materials gradually advance, so that the next budget based on former market prices is likewise inadequate and the deficit must again be balanced with treasury certificates to be used as the basis for further inflation. This vicious circle has been pursued for the last three years. The results are startling.

Among total assets of 150,000,000,000 marks the most recent Reichsbank statement disclosed 130,000,000,000 marks of these to be treasury certificates and 5,000,000,000 marks composed of the other forms of currency, which had been accepted for redemption and are no more assets than their value as waste paper. The bank has issued 122,000,000,000 legal-tender notes. The significance of this may be vaguely estimated when it is remembered that in 1913 the total wealth of the German nation was appraised at 325,000,000,000 gold marks, and this included rich mineral deposits now confined within the borders of France and Poland. It is clear that the state of German finances and the financial stability of the Reichsbank are on an extremely wildcat foundation.

SALVATION BY TAXATION

THE only means of restoring a stable currency and sound Government finances would be the adoption of sound methods of taxation. There are two opposing forces. One is the Nationalists' or Junker Party. This faction is opposed to any adequate form of property tax. Agricultural products sell at very near world-market prices. Potatoes, for example, cost one hundred and thirty times the pre-war price, although the gold mark has only risen to sixty times the paper value. Such necessities as bread and potatoes have attained the nature of a semi-luxury, and butter is beyond the means of the average skilled mechanic or salaried man. The consequence has been an enormous increase in the price of agricultural land. The obvious procedure would be a heavy taxation of such inflated values to meet the inflated costs of government administrations and stop the further inflation of the currency. But the Junkers have served notice that they will not tolerate any such property tax, and, as they are known to have arms secreted on every big estate and large forces of disciplined units under their command, the Government fears to employ any vigorous opposition to their wishes lest they accomplish a *coup d'état*. The big interests, both financial and industrial, also oppose any property tax. They insist upon the present consumption and occupation taxes. Currency inflation has proved a benefit to them. It enables them to employ labor at less than one-tenth the wages of similar labor in America. This gives them a clear field

for such foreign commerce as they go after. Unemployment fluctuates with the rate of exchange. When the mark declines on Wall Street, unemployment is proportionately reduced in Berlin. That is, the lower the rate of exchange, the less labor cost in gold, and consequently more business for German employers. Labor is not paid in proportion to the decreased purchasing power of the mark.

Metal workers comprise about three-fifths of all industrial labor. In 1913 the average wage was .58 marks per hour; by the end of 1920 it had risen to 5.44 marks, and a year later to 9.71 marks per hour. Measured in gold, this was 14 cents before the war, and less than 5 cents at the beginning of this year! I am aware that it is not altogether fair to compare gold values in arriving at any conclusion regarding the adequacy of present wage scales in Germany, but this computation is made here to disclose the immense advantage over foreign competition which the existing economic conjunction affords the German exporter. Obviously, our iron, steel, and metal workers cannot compete with countries where skilled labor earns less than 50 cents per eight-hour day.

In arriving at this conclusion I encountered characteristic difficulties. I could get no official data concerning wages, although Germany conducts a very efficient Department of Labor. I was referred to a table published by the Frankfort "Gazette." On examining this, I found that it only referred to Frankfort labor conditions. That city has less manufacturing than any large center in Germany. I was surprised to see that the metal workers' wages had been quadrupled during 1921, not at all in accordance with conditions in Berlin, where many metal industries are located. I therefore secured wages statistics from 222 different cities with a total population of over twenty millions and arrived at an average wage. Instead of a four times increase in wages, the average increase during 1921 was less than sixty per cent. During that year the wholesale price index increased from 1,400 to 3,600 and the cost of living from 800 to 1,650. Retail prices have also advanced rapidly during the present year, so that labor is much worse off now than a year ago.

A stabilization of the mark would put an end to this, as wages would tend to approximate the pre-war standard of living. To prevent this, the industrial and financial interests are determined to continue the existing period of inflation, which affords them a tremendous advantage in foreign markets.

The situation reacts in another way on American business. Low wages and salaries prevent the consumption of necessities. A shirt at 400 marks is a luxury to an office employee whose salary is only four or five thousand marks a month, and he must have a pretty good job if he earns that much. He would have to appropriate nearly a

week's income to pay for a pair of shoes. This means a decreased demand for cotton, hides, and other commodities. It limits the importation of food products to an indispensable minimum. Copper products are unattainable for the average man, and such electrical devices as may be found in any American household are only within the means of the very rich in Germany.

To add to the advantage of the manufacturer and the financial embarrassment of the Government the railways are run at a great loss. Railways, post, and telegraph had a joint deficit of over 9,000,000,000 marks, nearly 7,000,000,000 marks charged to the railways. The steady increase in the cost of operation and maintenance necessitated a seventy per cent advance in rates early in the current year. The result was a marked decline in passenger earnings, showing that the charge was more than traffic would bear. However, overhead costs continue to increase and a large deficit is imminent in 1922.

An adequate basis of taxation would remedy all this and might even be used for deflation. The enforced loan of 1,000,000,000 gold marks to be used for meeting reparations payments is the only remedy proposed. The largest item in the 1922 budget is 71,000,000,000 marks from stock transfer and other corporation fees and taxes, 32,000,000,000 marks customs and stamp taxes, 10,000,000,000 marks coal taxes (excise), 3,500,000,000 marks tobacco taxes, and 1,000,000,000 marks each from taxes on beer and sugar consumption. There is an optimistic estimate of 2,500,000,000 marks' profit from the railway administration, which can scarcely be realized and 3,000,000,000 marks on post-war profits, which is likewise more liable to be a delusion than a realization because the law contains many evasive jokers. The separate states must also derive their revenues from these sources. Their incomes are prorated to them by the federal Government.

It will be observed that, with the exception of the problematical profits tax, all the revenues described above are levied upon consumption and traffic. Property, as such, goes scot free, and property values alone reflect the consequences of inflation. This is true of personal property as well as real estate. Stocks advanced during 1921 on the same scale as the increased price of the dollar. The gold value of such wealth is not materially affected by the fall of the mark.

Capital actively engaged in business suffers from impaired efficiency as a result of the depreciation of the currency. It is become more and more difficult to finance a business as the mark declines. A competitive business enterprise must take orders at the market price, but when the goods are delivered and have to be replenished the radical increase in prices call for a much larger investment in marks than had been needed a few months before to pay for the same

amount of material. There is a large machine plant near Dantsic that enjoyed a big automobile and truck business before and during the war. There is a brisk demand for their output in the Austrian and Russian succession states which are within easy hauling distance. Nevertheless the automobile department had to be shut down for lack of capital. The proprietor told me that he could use sixty or one hundred million paper marks to finance this business, but, although his credit is AA1 and the business would almost come of itself, he cannot raise the money.

A shoe manufacturer in Middle Germany has "increased" his capital from 150,000 pre-war marks (gold) to 2,000,000 paper marks. Naturally, he is harder up now than before the war. A one-story shed with wooden walls and tar-paper roof built last year cost him more than his four-story brick-and-concrete fire-proof factory. To such enterprises the tax on capital stock and consumption is an intolerable burden. An outright property tax would wipe out some of their book profits on appreciation of buildings and personal property, but it would benefit them in the long run by wiping out the Government deficit, stabilizing the mark, and consequently increasing the purchasing power of the masses. However, they persist in ignoring these palpable facts and lend their support to the votaries of evasion and haggling.

The Army of Occupation is another hindrance to the economic sanitation of Europe. It is a luxury that neither France nor Germany can afford. Its purpose might be better accomplished by an accord between France, Poland, and Czechoslovakia similar to the Little Entente and threatening Germany with immediate invasion in case there was even the appearance of a recrudescence of militarism. In fact, such a threat might be more effective than the actual occupation of the Rhineland. The Junkers are mostly east of the Elbe, and, whereas they view the occupation of the industrial western provinces with equanimity, the possibility of a Polish invasion and the quartering of the despised Pole on their baronial estates would serve to curb any reactionary moves.

GERMANY CAN PAY

GERMANY needs a breathing spell and the opportunity for her statesmen to restore economic order by rational means and unhampered by Junkers, Stinneses, or Rathenaus. She may not have vigor enough to obtain this freedom for herself. The Allies may have to thrust it on her as a condition for meeting reparations obligations. The future alone can tell which course may be the right one. Two facts are now well established: Germany is able to pay reparations in kind without injury to herself or others, and she can do so promptly whenever special interests are rendered powerless for further evasion of her just obligations.

ALABAMA GOES FISHING

BY GARRARD HARRIS

THERE is probably more running water in Alabama, potential angling water, than in any other State in the Union. Certainly there are more navigable rivers and more miles of navigable river water than in any other State—that much can be learned from Government surveys. All of these rivers have creeks, brooks, and other tributaries which once were full of fish.

Vandalism, growing more and more destructive as more efficient agencies of destruction came to hand, wrought havoc with the fishing, especially in the north-central portion of the State, the mineral region, until only a few of the larger streams had anything left at all to tempt a fisherman.

Fish traps, seining, dynamiting, the use of "lime jugs" and calcium carbide—all of these have been used by unsportsmanlike people. Did a coal or ore miner or limestone quarrier desire "a mess of fish"? He dealt with dynamite in his occupation of shooting out coal and iron ore or limestone for the furnaces and kilns. He put a few sticks in his pocket, hid himself to the nearest water and exploded the stuff in the deep pools. Dead fish, killed by the concussion, would rise to the surface. He took what he wanted and did not bother about the rest. The explosion killed everything in its vicinity, big and little. The water thereabout was made barren.

If a countryman did not have a seine—and nearly every neighborhood had one—he would take a two-gallon jug, fill it almost full of lime, hammer a wooden or corn-cob stopper in and wire it down tight, leaving a groove so water could enter the jug. Stones attached would sink it, and then it was let down easily in the water so as not to scare the fish away by a splash. The water, entering the jug and coming in contact with the lime, generated a tremendous heat, and directly there would be an explosion. The water would boil and seethe and a milky area from the lime spread out. What the explosion did not kill by concussion the lime in the water quickly made sick and inert. Ye gentle yokel filled a croker-sack with such fish as he could salvage, leaving the surface of the water covered with small dead ones, and perhaps many large ones he could not reach. The lime-water went on downstream to make other fish ill and kill myriads of the small fry which could not recuperate from the poison.

When acetylene gas came into more general use, some destructive genius tried using carbide in a soda-pop bottle instead of lime in a jug; it was quite as destructive, and is a favorite method of some town vandals even now. It is all just another variation of Charles Lamb's old child's story about the Chinese youth who burned down a house every time he wanted some roast pig!

THE FLEET OF FISHING BOATS AT CAMP OLIVER, ON LAKE BANKHEAD, READY FOR THE MEMBERS TO GO OUT AFTER THE DENIZENS OF THE LAKE ON OPENING DAY, MAY 15, 1922. MOTOR BOATS ARE MOORED AT THE WHARF

It never seemed to occur to any one that the streams were being made barren; that the small fry were being exterminated along with the large fish. It was a case of "after me, the deluge." The trapper, seiner, dynamiter, lime-jugger and carbide user cared nothing about saving a supply of young fish for replenishment. It was the same reckless spirit of waste and destruction which has characterized all America—with mere variations as to region.

Then some twelve years ago John H. Wallace, Jr., a young lawyer of Huntsville, Alabama, was elected to the Legislature. He prepared a code of conservation laws and provided for the office of "Fish and Game Commissioner." When the next election came on, nobody seemed inclined to run for office, so he made the race and was elected. It was a huge joke in the State then. John Wallace stood a lot of chaffing; they called him the "buzzard protector," the "catfish captain," and all that sort of thing. A magnetic personality, an orator of no mean ability, Wallace stumped the State, preaching his doctrine of conservation and explaining the code of laws he had passed.

He had no opponent for the office, but there was some opposition and grumbling. Farmers wagged their heads and swore they'd "be teetotally derned if anybody could keep them from shootin' a mess of fish outen their own cricks, or seinin' 'em when they got good an' ready, or shootin' a patteridge anywhur, anytime, they felt like it, b'gosh!" Wallace was elected, and procured some further amendments and amplification of

the conservation laws. He spent most of his time going about over the State, lecturing, visiting schools, and inculcating the fundamentals of his doctrine. He instituted "Bird Day" in Alabama, and issued a handsome volume of conservation data, illustrated with colored plates of some Alabama birds. "Bird Day" in the public schools of the State is a fixture, and each year there comes another volume from the Department of Conservation.

Wallace's term expired, and he ran again. This time he procured the enactment of a hunting license, and had *ex-officio* game wardens appointed in conjunction with other county duties. The hunting license had rough sledding in the Legislature, but Wallace put it over and it stuck, and a few scattering arrests and convictions for violation of the game laws began to inculcate some respect for them. Still, there was the dead-weight of inertia on the part of sportsmen and the public generally. Where there was one conviction there were hundreds of offenses never punished.

Once more Wallace ran, defeating an opponent this time, for the office was now designated as "Conservation Commissioner," and it was one of considerable dignity and prestige in general estimation. Wallace further perfected the game code, shortened the season for shooting of game birds, and was making real headway, when he died in 1921. An able and active conservationist stepped into the place, but John Wallace was the father of conservation in Alabama.

What Commissioner Wallace com-

DINING HALL, COMMISSARY STORE, AND KEEPER'S HOUSE AT CAMP OLIVER ON
OPENING DAY BEFORE THE FINISHING TOUCHES WERE ADDED

The dormitory (not shown) is twice as long as the dining hall, and the private cottages are in the rear and back of the reader. Lake Bankhead is down the slope to the left, past the keeper's house

plained of chiefly was lack of co-operation on the part of sportsmen and those who should be directly interested in the preservation of denizens of field and stream and the natural beauties of the State. His story was admitted to be true and what he said valuable, but it was much like the weather, which Mark Twain once said everybody complained of yet nobody did anything about.

On a perfect day in early March, 1921, one of the editors of the Birmingham "News," who had lately come to the State, took a day off and hied himself to Shade's Creek, one of the most beautiful streams in the State, running through Shade's Valley, about six miles from Birmingham. If there is any water in this whole country that ought to be teeming with fish, that stream is it. This newspaper man is a good fisherman, and he fished that stream closely for about seven miles, until late in the afternoon. An old colored man came up a path along the bank and stopped to observe the hopeful Izaak Waltonian.

"Havin' any luck, boss?" he inquired, in friendly interest.

"Not a bite or a strike all day."

"Huh! I reckon not; ain't nothin' in dis yer creek!"

"Ought to be; it's the prettiest water I have ever seen."

"Dat's de trufe—and hit used ter have. I been livin' round heah fifty yeahs, an' hit used ter be plumb chock full of fine fish."

"What's the matter now?"

"Dese yere devilish miners down at Oxmoor, an' dem folks in dat town, an' dese yer po' white trash livin' round about. Dey have been dynamitin' it from een to de yuther. What dey ain't killed wid 'splosives dey has seined out, twell now dey has even quit dynamitin' it, for hit's a plumb waste of time. Dere ain't nothin' here to kill—not even mud turkles."

He went on his way, which happened

to be the way back of the newspaper man, who wound up his line and walked along, learning more about the vandalism and methods of destruction. March 9, 1921, the Birmingham "News" contained a straight-from-the-shoulder editorial urging the need for the many real sportsmen of Birmingham to get together and put a stop to such conditions, within the vicinity of Birmingham, at least.

Two men responded by calling on the editor, Major Lucien Brown and J. H. McCollister. It was decided to make a start. On the same typewriter the same hand that wrote the editorial typed off three sheets containing a call for organization. The three men signed, and the three copies were placed in sporting-goods stores, to be called to the attention of sportsmen. Several other editorials followed at intervals.

Clerks in the stores were very indifferent. They did not even take the trouble to show the copies of the call to customers who might be interested. Then Major Brown and McCollister "got their dander up" and personally carried the lists to sportsmen they knew. About two hundred signed, and on June 5 the announcement was made in the "News" that the meeting for organization would be June 6, at eight o'clock, at the Court House. Conservation Commissioner Wallace had accepted an invitation to be present and make a talk. About three hundred sportsmen were present, and the club was launched with W. G. Oliver, a wealthy business man and popular sportsman, as president. A constitution and by-laws which Commissioner Wallace had brought were adopted. The organization was named the "Jefferson Fishermen's Association," in honor of Joe Jefferson, the veteran actor, one of the most devoted fishermen this country has ever known. The charter members numbered about two hundred. At the meeting two weeks later fifty

came in, and the enthusiasm began to spread.

A reward of \$100 was offered for the arrest and conviction, or for information leading to the arrest and conviction, of any dynamiter or user of explosives; a less amount for seiners. Placards offering the reward and stating the laws of Alabama about such vandalism were printed on heavy pasteboard and members tacked them up all along the county roads and fishing routes. The dues of the club were fixed at \$2 per year. Each member had to be of good standing, had to subscribe to "The Sportsman's Creed" and promise to obey the laws and try to induce others to. These were the only formalities. Memberships rolled in.

The meetings grew larger and were the most amazingly democratic affairs. Bricklayers, professors, doctors, iron-molders, carpenters, lawyers, preachers, laborers, bankers, and business men all met upon the utmost equality and fraternity. All were sportsmen, fishermen, and disciples of conservation in earnest about doing something constructive. That was enough—what else a man was or was not didn't matter in the least. The idea soaked in that real conservation was the result of education, and the members went after more members with the enthusiasm of zealots, to convert them and get them to work.

Inquiries from over the State began to come in as to qualifications for membership. As Birmingham is situated in Jefferson County, outsiders imagined the club was designed purely as a local affair, and numerous hunters said that they would join but they did not particularly care about fishing. The name was then changed to "The Alabama Fishermen and Hunters' Association." A more comprehensive constitution and by-laws were adopted and the organization legally incorporated.

The amazing growth continued, and there soon became manifest a disposi-

tion to have a home, or center, or headquarters, of its own. President Oliver suggested going out on Lake Bankhead, and he was empowered to select a site. The Black Warrior River is about twenty-eight miles from Birmingham and is one of the most beautiful streams in the State. A system of locks and dams has made it navigable and a large tonnage is carried on it to and from the ports of Mobile and New Orleans. The uppermost lock, No. 17, is one hundred feet high, and the water backed up behind this dam goes into many coves and valleys and forms what is known as "Lake Bankhead." It has a total shoreline of about four hundred miles, is vastly deep in places, and is a magnificent fishing territory. It is too wide and deep for seining, and even dynamiters or other vandals have not been able appreciably to diminish the fish there.

The Association bought seventy-two acres of land on its borders, a beautiful site in every way. Bonds of the Association (6 per cent thirty-year first-mortgage securities) were authorized to the extent of \$20,000, and the first \$10,000 was used in paying for land and erecting the most necessary buildings and improvements. A dormitory where one hundred members can sleep has been erected, and several box tents for the use of families; a mess hall where one hundred at a time can dine; a fine kitchen and pantry built, as well as a store building and the keeper's lodge. The tract was surveyed with the contour of the land, and those members desiring to erect cottages were awarded lots on nominal lease for thirty years, the buildings to be erected to be approved by the Buildings and Grounds Committee to preserve the harmony of the surroundings. A central site has been left for the main club-house or assembly hall, which will be a rustic structure, mainly wide porches and large lounging-rooms with stone chimneys and great wide fireplaces. It will give a wonderful view from its knoll. The balance of the bond issue will be used in constructing this building. Some fifty pretty cottages and camps have already been constructed on the tract by private individuals, with others in prospect.

The government of Camp Oliver, as the place has been named, after the enthusiastic president of the Association, is vested in the Governing Board, made up of the chairmen of the Buildings, Grounds, Sanitation, House, Restaurant, Boats, Safety, Rules, Press, Water and Light, and House Committees, with the president and secretary of the Association as *ex officio* in the same capacity for the Governing Board.

Members may go to the camp and spend a week at a time, being provided with a cot and shower-baths and all other conveniences except food, without any cost whatever. If the member desires to cook his own food, the "community kitchen" has been provided—a

raised dirt platform within a retaining wall of rock with little grated open-air brick fireplaces. If he desires to buy food from the restaurant, it is obligated to furnish a wholesome, well-cooked meal at 50 cents.

There are no paid officers save the secretary, and he receives a nominal sum. There is absolutely no "overhead" for maintenance of Camp Oliver, for the boat renting, restaurant, store, and gasoline privileges have been leased for a sufficient sum to pay the interest on the bonds, and the lessee is obligated to act as keeper and superintendent of the camp.

July 1, 1922, the actual paid membership of the Association was 2,079, with new members coming in at the rate of several every day. Branches are in progress of formation in other parts of the State. The dues of these branches will be \$2 a year, of which \$1 will be remitted to the parent club to be used in restocking waters and in carrying on the propaganda of conservation.

The United States Bureau of Fisheries is co-operating, and agents have been in conference with the Association. These agents express the belief that in some of the cold, clear hill-country streams of north Alabama the famous rainbow trout will thrive. The Association is now conducting temperature records in some of these streams to determine this. Much work was done this last spring under the direction of the Bureau representatives in removing small fry of bass and other game fish from congested private ponds and distributing them in barren public waters. Every stream in Jefferson County has been restocked and 50,000 fingerling bass liberated in Lake Bankhead at Camp Oliver.

A convention of sportsmen from all parts of the State will be held at Montgomery in September, at which time a programme for shortening the open game season, the imposition of a bag limit for fish, prohibiting fishing in the spawning season, providing for a fishing license and for permanently employed fish and game wardens will be worked out, and presented to the Legislature in January for adoption, with the moral and political force of the sportsmen of the State behind it. Several smaller sportsmen's clubs are expected to affiliate with the Alabama Association at that time. Another plan is to have the State employ the \$120,000 accumulated in the State treasury from hunters' licenses and fines used in establishing a fish hatchery for the State to accelerate the replenishing of waters and keep up the supply. Preventing pollution of streams by mine water or refuse from manufactories is another object.

The winter programme of the Association embraces lectures and talks to the children of all the schools on conservation, true sportsmanship, and interesting hunting and fishing yarns; close co-operation and encouragement of the Boy Scouts and the Girl Scouts; and

carrying on the propaganda of conservation in all ways possible, together with the organization of branches at other points in the State.

There are sixty women who are enthusiastic members of the Association, and more women are going to be sought as members and interested in outdoor life. The families of members are planning to make use of Camp Oliver this summer, and sixty-five lots have been assigned to members who have to build within thirty days or forfeit. A number of artistic cottages are now under way on the grounds.

Since the organization and offering the reward and the first convictions, if there has been a case of dynamiting in Jefferson County the Association has not been able to hear of it, and every member constitutes himself a committee of one to report all depredations and violations of the law he hears of. Seining has practically ceased, and the tendency now is to build, to restore, to make beautiful.

The grounds at Camp Oliver are being planted with wild honeysuckle, or azalea, rhododendron, mountain laurel, holly, wild crab-apple, dogwood, and judas-tree. The cottage owners are going to embower their cottages in wild woodbine and Virginia creeper, and bring such ferns and wild flowers as the woods are full of. The club colors, russet and moss green, are carried out in the staining of the buildings and roofs.

Over on the eastern border of the State the Coosa River, famous as a fishing ground, has been dammed at one place by the Alabama Power Company, making a great inland lake which is famous already as a fishing ground. It has offered free to the Alabama Fishermen and Hunters' Association sufficient land and buildings, left from the construction camps, for another camp similar to Camp Oliver, and the offer will probably be accepted and provide a rendezvous for the sportsmen of the northeastern part of the State. The same company is now constructing another dam toward the south-central part of the State on the same stream, and makes a similar offer as to that location, affording a camp for the sportsmen of that region. The Association is thus armed with the attractive proposition of three model fishing and hunting camps with which to approach the lukewarm sportsmen of the rest of the State who have not yet come into the organization to add their individual force to the weight of those who are aggressively fighting for real conservation and constructive and upbuilding effort. Organizers will take the field in September and endeavor to gather into the Association ten thousand sportsmen before the year is out.

And all of this because a newspaper man went fishing and didn't get a bite, and then voiced his indignation at vandalism which had come to be accepted as a matter of course!

THE BOOK TABLE

LIVES UNALIKE

TO many readers not especially interested in the art vagaries of the post-impressionists the name of Gauguin is best known because he was the fiction model, so to speak, of W. S. Maugham's novel "The Moon and Sixpence," a powerful, repellent story. Naturally, the novel might be supposed to exaggerate—but not at all; Gauguin was stranger than Maugham's character. An Outlook reviewer wrote of the latter: "A man who might have had love, friendship, decent living, but who renounces all to follow an instinctive desire to paint. Until middle age he is a commonplace business man with no perceptible leaning to art. Then he abandons wife and children heartlessly and without provision, lives in filthy poverty in the slums of Paris, and later in Pacific islands—and paints, paints, paints! He is brutal, lustful, and detestable."

Now comes a volume of Gauguin's letters¹ to his only friend, de Monfried, and his own words show that his life and his acts are exactly described above. Frederick O'Brien, who writes the Foreword, says: "Gauguin's whole life as a painter was an outcry, almost a curse, against materialism, against accepted success; against laws, morals, money, critics, and clerics." His personal morals were atrocious; he heartlessly deserted wife and children and later one woman after another; in his wretched, dying days in the South Seas the only one who cared for him was one of these discarded mistresses. And when, near the end, he at last became homesick for civilization, de Monfried wrote him: "You must not return. Now you are the great dead. You have passed into the history of art." In other words, Gauguin's fame as a genius rested on his repudiation of all that is civilized and decent, so he must not spoil the pose! Nowadays his pictures sell at high prices, but in these letters we find him offering to sign an agreement to send a dealer fifteen canvases each year for five years for the sum total of \$480 a year! He made it his goal to be a savage (O'Brien uses those words), and apart from posthumous fame he reaped that reward.

Whether Gauguin was a great painter or a freak is a matter of opinion. With Cézanne and Van Gogh (who died an insane suicide) he is hailed as a leader in a new art. This book does not convince one of his genius. It does furnish a tragic picture of the profound moral abyss into which a man may fall who sacrifices to one passionate desire all bonds of friendship, family affection, and decent conduct.

Why, then, discuss Gauguin? It may be confessed that one reason is that he may be contrasted with the author of

"Pages from the Past."² John Ayscough is the name on the title-page, and it may be remembered as that of a writer of a few moderately successful novels. The author is really a Catholic ecclesiastic, the Right Reverend Monsignor Count Bickerstaffe Drew. He is a delightful raconteur, a man who has enjoyed life immensely, who believes that the world has progressed and is progressing, who has warm sympathies and keen wit—the very antipodes of the self-immolated martyr to art ideals above described. He knew every one worth knowing a generation ago, has anecdotes or bits of criticism about Trollope, George Eliot, Mrs. Gaskell, and scores of people in literary, political, and social circles. His tone is friendly and urbane, but has the spice of apt retort and repartee.

Dr. Drew perhaps saw Cardinal Manning at closer range than any one else. His reports of the Cardinal's somewhat caustic wit and contrasting serene faith are good reading. Here is one about the snubbing of an ostentatious prelate:

Once he brought a very magnificent bishop, who by no means despised ornament, to see St. Thomas's Seminary.

"It is very plain," remarked his Lordship, scanning the rather austere façade.

"You are right," rejoined the Cardinal most sweetly. "Quite. There is nothing vulgar about it."

On another occasion the same prelate was a fellow-guest, with the Cardinal, of royalty. The Bishop came in purple; the Cardinal presently arrived in his ordinary black coat, breeches, gaiters, and apron; to whom the Bishop rushed up, much perturbed at thus eclipsing in splendor a Prince of the Church.

"Never mind, my dear Lord," said the Cardinal. "It does not matter. I dare say no one will notice you."

And here is a story of Manning's friend Dr. Rawes:

Concerning him, one who had been

¹Pages from the Past. By John Ayscough. Longmans, Green & Co., New York. \$2.50.

his pupil told me this story. The Doctor was his confessor, and he had been used to make his preparation for confession out of his own head. But on one occasion, finding a prayer-book in his seat in chapel, while waiting his turn to make his confession, he examined himself out of the formula he found there, and determined to make present use of it.

When he went into the box, at first, while the youthful penitent followed his usual simple method, he was heard with the usual patient tolerance. But when, mindful of the book, he added:

"Since my last confession I have not always been duly submissive to my superiors," there came from beyond the grille an irrepressible movement of impatience.

"Nor," the boy went on, "have I been invariably affable to my equals."

"Ugh!" from the confessor.

"Nor," added the penitent, completing his formula, "have I been condescending to my inferiors."

"You haven't got any!"

Evidently, judging from this delightful book, the life religious, sacerdotal, and celibate does not prevent a man being humorous, observing, and astute. Thus Manning observed of Disraeli:

Dizzy was a Jew with a fund of Anglican predilections. He could not abide Nonconformity. (Nonconformists are traditionally Liberals.) He liked the Church of England because it is established and therefore ornate. He had also strings of affection for the Catholic Church because it is "the old Religion." He said to me one day, with high glee, in reference to a bill he was introducing, "It won't touch us, nor you; but it will dish the Dis-senters."

And John Ayscough adds, as to Disraeli's novels: "They are too sparkling. The ladies and gentlemen talk like the ladies and gentlemen a ventriloquist holds on his knee."

Altogether this is a gracious and cheerful book and one that goes far to take the taste out of one's mouth left by Gauguin's morbid and self-centered groanings.

R. D. TOWNSEND.

THE NEW BOOKS

BIOGRAPHY

DAYS THAT ARE NO MORE (THE). By Princess Pauline Metternich. E. P. Dutton & Co., New York. \$5.

Princess Pauline was a brilliant and erratic personage at the Court of Napoleon the Little. Presumably this is a translation, but nothing is told us as to when and where the original appeared except that in a prefatory chapter by Edward Legge—a sort of *chronique scandaleuse* of Paris and Vienna Court life—he remarks that he read in 1920 in "Le Temps" that the Princess was going to publish her recollections. She was both the granddaughter and the daughter-in-law of Prince Clemens Met-

ternich, the famous Chancellor, for she married her Uncle Richard, son of the Chancellor.

The book is not important historically or politically, but it has some lively bits of reminiscence about Metternich, Napoleon III, Eugénie, Liszt, Wagner, Count Taaffe, Home, the medium (Browning's "Sludge"), and other notables of a generation ago and more.

LENIN. By M. A. Landau-Aldanov. From the French. E. P. Dutton & Co., New York. -\$.3.

This book will be interesting, and perhaps valuable, to any reader who is already somewhat familiar with Lenin and the recent history of Russia. By

¹The Letters of Paul Gauguin to Georges Daniel de Monfried. Dodd, Mead & Co., New York. \$3.

others it must be read with caution. There are several sects in the Communist school, and no love is lost between them. The author of this book is a representative of a sect bitterly hostile to the one to which Lenin belongs. The portrait is therefore that of a hostile critic. One chapter is devoted to "The Personality of Lenin." It is not flattering. He is not financially corrupt. He rendered valuable service to Germany, but was never her paid agent. He lives frugally and does not care for money. But he is a fanatic and has himself repeated the titles his comrades have given him: "autocrat, bureaucrat, formalist, centralist, one-sided, pig-headed, stubborn, narrow, suspicious, unsociable." He has surrounded himself with all kinds of common criminals, especially thieves. He writes poorly, is not an orator, knows very little outside of political economy. But he has a certain kind of magnetism; is a good hater; inspires and foments class hatred. "The strength which has made him the true prophet of our plunge to the depths of revolution lies in his ability to appeal to the lowest instincts of human nature." And his fanaticism makes him as unscrupulous in his methods as was Robespierre, with whom he may be compared.

This may be a true picture; we suspect that there is a large measure of truth in it. But no one, not even the author, would claim for it that it is unprejudiced. The author's anticipation of the future is encouraging to believers in the right of personal property and the civilization which has been built upon that right.

LIFE AND LETTERS OF SIR WILFRID LAURIER. By Oscar Douglas Skelton. 2 vols. The Century Company, New York. \$8.

No one could have seen the late Sir Wilfrid Laurier without finding him a singularly picturesque man. He came from an old Canadian-French family, but emancipated himself from Catholic and Conservative tutelage, for he was a natural Liberal. The story of this emancipation is the most interesting part of the present volumes. But they are interesting throughout. Not only do they describe an appealing and dramatic character, they cover the period of the development of Canada since its confederation—that is to say, from the status of a group of small provinces to the status of a nation. In this transformation Laurier was a great guide for the Dominion—perhaps he was the most eminent statesman Canada has produced. Certainly there was no more eloquent advocate of Imperial representation than he. Of a man like himself as such a representative he once said: "I should regard it as a glorious day when Canada would be represented in the historic halls of the Commons of England by a French-Canadian who would bring into these new surroundings . . . the logical spirit, the ardor of feeling, the lively imagination . . . which from all time has characterized the

French genius." Yet with this he was equally insistent on Canada's independence. "Canada is a nation," he declared, "Canada is free. . . . In a few years the earth will be encircled by a series of independent nations, recognizing, however, the suzerainty of England."

MY AMERICAN DIARY. By Clare Sheridan. Illustrated. Boni & Liveright, New York. \$3.

Some readers are prejudiced against books written in diary form; they expect to find in them a lot of dates and inconsequential entries. This book will fairly disappoint such readers; the dates are unobtrusive and the entries, while gossipy, are sprightly, entertaining, and often shrewd in their characterizations. They cover a wide range of travel in both the United States and Mexico. They are certainly unconventional and, some readers will think, too frank—but then the author is an unconventional woman and is accustomed to speaking her mind. Her book reflects her character with unsparing fidelity.

HISTORY AND POLITICAL ECONOMY INDUSTRIAL AND COMMERCIAL SOUTH AMERICA. By Annie S. Peck. E. P. Dutton & Co., New York. \$5.

This is a useful and valuable compendium of information. It has new maps and is otherwise up to date. The publishers correctly describe it as a "mine of information in regard to the several countries of the southern continent—their cities and ports; transportation systems, exterior and interior; physical characteristics and natural resources; products and possibilities, agricultural, mineral, stock-raising, and forestry."

MANCHESTER GUARDIAN (THE). By William Haslam Mills. Henry Holt & Co., New York. \$2.50.

This story of the hundred years' service of the Manchester "Guardian" to its own town, to Great Britain, and to the world is told here succinctly and interestingly. American journalists may learn from it the inspiring lesson that, in the case at least of the high-minded Englishmen who founded and have conducted the "Guardian," exalted ideals and consistent devotion to them have resulted in a steadily widening success for their newspaper.

MISCELLANEOUS

HOUSE OWNER'S BOOK (THE). By Allen L. Churchill and Leonard Wickenden. The Funk & Wagnalls Company, New York. \$2.

The house-owner who objects to the high cost of repairs in these days may learn many money-saving tricks from this book. And even if economy is not his first thought, there are many things about the house—such as its electrical equipment, the treatment of hardwood floors, the water supply, etc.—that are explained so simply and thoroughly that the puzzled reader will be happy in the possession of the book.

IN THE CLUTCH OF CIRCUMSTANCE: MY OWN STORY. By a Burglar. D. Appleton & Co., New York. \$2.

Here is a tragical narrative with a happy ending. The author, he tells us,

was unjustly sent to jail when a mere boy and his life thereby directed into channels of crime. His various prison experiences, his share in the "Mark Twain burglary," his sentence of ten years therefor, and his final redemption and resolve to become a useful member of society are described effectively.

NELSON'S NEW DICTIONARY. Prepared by the Nelson Editorial Staff, with an Introduction by John H. Finley, LL.D. Thomas Nelson & Sons, New York. \$1.

A handy little word-book that will find a useful place on many a desk or typewriter. The print is larger than in most books of the kind, and the definitions are brief but comprehensive.

*"Came Prometheus, the Fire-Bringer, he who snatched from the sun's glowing chariot thrice-precious fire and brought it, hidden in a fennel-stalk, to earth, that men might live like gods in its pleasant warmth."
(Transl. Greek Myth)*

THIS is today's Prometheus Bringer of comforts The Chemical Engineer!

One of civilization's pioneers, it is he who has brought to mankind comforts and conveniences that a century ago were only wishes.

It is he who, searching in the hidden depths of Nature, has bared her secrets and laid at the feet of the world's industries new substances, new uses for them, new ways of using the present materials of commerce in the satisfying of man's wants.

It is he who, watching on the frontiers of science, has seen in his test-tubes visions of industries yet unborn that are to drive commerce to the far corners of the earth in the service of man's needs.

The world's debt to The Chemical Engineer is one that can never be paid.

This is one of a series of advertisements published that the public may have a clearer understanding of E. I. du Pont de Nemours & Co. and its products.

Her God-Speed Gift of Flowers

"God-speed" is a word not often used nowadays, but the spirit of its genuine old-time sweetness returns when you "say it with flowers."

How different the journey companioned by the thought that somebody cares. And in life's journey how pleasant the way when garlanded about each stepping-stone of time—our birthdays—are those God-speed remembrances from friends expressed in flowers.

"Say it with Flowers" Your Florist will be

glad to aid in your selections of floral tokens appropriate for every occasion.

Flowers may be telegraphed to any place in the United States or Canada and delivered in a few hours through the Florist Telegraph Delivery Service.

BY THE WAY

ONE of the favorite ways of "seeing New York" is from the top of a Fifth Avenue bus. In fair weather this gives an interesting view of the busy Avenue, with its fine stores, its congested traffic, its churches and residences. The outside seats of the bus are therefore nearly always crowded—except in rainy weather, when they are deserted by all but a few hardy sight-seers. A rainy day brings a loss to the bus company of \$1,000 an hour, a daily paper says. On the other hand, the ill wind that brings for the busses a dark rainy afternoon proves a good thing for the subway, whose income thereby gains \$10,000 for the half-day, it is said, from the passengers who might otherwise walk or take the bus or a surface car.

Let the stranger in New York City who by chance becomes oppressed with the vastness, the unfriendliness, or the noise of the metropolis, turn into Twenty-ninth Street at Fifth Avenue and go into the quiet of the Little Church Around the Corner and read the following inscription on a small memorial window. Having read it, he should go away heartened again for plunging into the maelstrom outside:

RICHARD MANSFIELD

One who never turned his back, but
marched breast-forward
Never doubted clouds would break
Never dreamed though Right were
worsted Wrong would triumph
Held we fall to rise, are baffled to
fight better
Sleep to wake.

So pungent are some of the Japanese sayings, the Boston "Transcript" observes, that our equivalents seem flat in comparison. For example, where we say, "Accidents will happen in the best of families," the Japs have it, "Even a monkey will sometimes fall from a tree." "The more haste, the less speed," becomes "If in a hurry, go round." And where we say, "Oil and water will not mix," they say, "You can't rivet a nail in a custard."

"When I was a little girl, five or six years ago," says the twelve-year-old author of a prize letter in the "Nebraska Farmer," "I was told to cook some asparagus while my mother was working in the garden. I called to mother and asked her how much salt to put in it. She answered back, 'Oh, about a level teaspoonful,' but I understood her to say, 'Eleven teaspoonfuls.' I thought that a great amount, but said to myself, Mother must know. Still, I only put nine spoonfuls in. As we began supper I said, 'Mother, I didn't put eleven teaspoonfuls of salt in the asparagus; I only put nine in. I am sorry if I didn't put enough in, but eleven spoonfuls seemed like so many!' 'Eleven teaspoonfuls!' exclaimed mother, and father and mother and brothers had a good laugh on me. Whenever asparagus is mentioned I think of the first time I ever cooked any."

Dwyer's Letters and Views from Strange Cities

In November I ran a little advertisement in The Outlook in which I told of my Personal Weekly Letters from foreign towns, each letter from a different city, each enclosing a view. I offered a free specimen letter to all Outlook readers who would send their names and addresses.

I received scores of letters, and seventy per cent of the inquirers are now subscribers. They are more than subscribers. They are Friends. I think of myself as the Traveling Friend.

These November subscribers have received letters from Cannes, Monte Carlo, San Remo, Genoa, Ajaccio, Calvi, Toulon, Marseilles, Turin, Milan, Lake Como, Verona, Venice, Trieste, the Italian Battlefields, Padua, Thun, Lucerne, Chiasso, Monaco, and other places. They write me splendid letters of thanks telling me how delighted they are with the Letters and Views.

Outlook readers are intelligent searchers after reliable information. My letters contain that information because they are mailed in the city I write about. I am on the spot.

You probably know my work. I am the author of many books and a thousand short stories in leading magazines.

Wouldn't you like a free specimen letter and view? No obligation. A bright chatty letter of people and attractions. Of Monte Carlo and the Casino perhaps? Of lovely Lucerne and the Lake? Of Venice and her thousand Canals?

JULY 26, 1922

S

ABNORMALCY

HE may go from his desk or his counter to his home in the suburbs, to dig in his garden or to spend his evening at a movie. He may work in the fields all day and then let down the pasture bars and follow the cows to the barn for milking time. He may take the afternoon off from his office for a session at the baseball game or for a round of golf. He may spend his day in a machine shop and go with his family to an amusement park in the evening. He may be making calls, all day and some of the night, on his patients. Whatever he does, the ordinary citizen finds the routine of one day much like that of another. It is only in the newspapers that he lives in a world of unrest. There he finds himself in the midst of civil war in Ireland, in the conflict of a great coal strike and a railway strike involving hundreds of thousands of men and their families in America, in famine and terror in Russia, in revolution and anarchy in China, in political disorders in Germany, and in the fiasco of an international conference at The Hague. Most of the news of the day he finds disturbing. He is really living two lives—one in his immediate environment, the other in the environment of his imagination.

Even in the midst of the terror of the French Revolution life, according to Carlyle's description, went on much as usual on the other side of the Seine. To-day we in America are really nearer to Ireland and Russia than the people of southern France during the French Revolution were to their compatriots in Paris. For the great majority, physical life to-day is actually more nearly normal than it seems. It is the minds of men that are disturbed more than their bodies. This of itself is a sign of progress. Every one who reads and thinks lives not only in the present but in the future, lives not only in the spot he calls his home but in all parts of the world.

If the world seems restless in these days, it is because it knows more than it ever knew before.

RUSSIAN RELIEF

HERBERT HOOVER, Secretary of Commerce, has rendered an account of the activities of the American Relief Administration in Russia. The record of the achievements of this organization under Mr. Hoover's management is in

Underwood

HUNGRY RUSSIAN WOMEN KNEELING IN GRATITUDE BEFORE AN AMERICAN RELIEF ADMINISTRATION OFFICIAL WHO HAS ARRIVED IN SAMARA WITH AMERICAN CORN

itself a complete answer to those who have charged that America lacked sympathy with suffering Russia because it has refused to recognize the minority Government of that distressed country.

According to Mr. Hoover's report, the Relief Administration "is now reaching all accessible persons whose lives are in jeopardy, and the loss of life directly due to starvation ceased some time since, although almost every one in Russia is hungry. There was considerable loss of life early in the winter, which would have been much abated had the Russian railways been able to transport the large surplus of supplies which the American Relief Administration maintained in Russian ports."

There appear to be supplies enough to carry through until the next harvest, and the surplus then available will be devoted to the further support of destitute children. Apparently a comparatively good harvest is looked for this summer. The famine region, it is expected, will produce three or four times the quantity of food which it did last year—a fact due to the large shipment of seeds. It is good news that the great famine is under control, even though it cannot yet be said that all sources of suffering have been eliminated.

The amount of material shipped to

Russia amounts to a surprising total. Europe sent some 45,000 tons of material having a value of approximately \$5,000,000. The United States Relief Administration has, for its own account and that of other agencies acting through it, shipped supplies amounting to 788,878 tons. The estimated value of these supplies totals more than \$59,000,000.

THE APPARENT FIASCO AT THE HAGUE

BETWEEN the Russian Bolsheviks and the rest of the world there is a great gulf fixed. Lloyd George's attempt to bridge that gulf at Genoa proved futile. Even political engineers, no matter what their ability, when they build bridges must have foundations for their piers; and the shifting sands of Bolshevik infidelity furnish no solid bottom on which to build any trustworthy international relations. This proved to be evident at Genoa. Nevertheless it was provided that experts representing Russia, as well as other European Governments, should meet at The Hague a few weeks later in order to see whether they could plan something that would bridge the gulf.

Of course the new attempt is proving futile, like the other. At the Hague Conference the chief British representative, Sir Philip Lloyd Greame, has ap-

parently reached on behalf of Great Britain a conclusion which virtually reverses the policy advocated by Lloyd George at Genoa. When the French insisted that foreign property rights in Russia be protected and foreign property seized by the Bolsheviks be restored, they encountered an obstacle in Lloyd George himself. Now at The Hague Great Britain has virtually come around to the French view. All the cost in money, energy, and anxiety involved in these two conferences, the one at Genoa and the other at The Hague, seems to be a high price to pay for convincing Lloyd George of the obvious. However, if there was no other way to show the utter unreasonableness of the Bolsheviks, these two conferences may have been worth while.

Whether anything further will come from The Hague is not at all certain as we write. There was every indication by the 15th of the month that the conference there was about to dissolve, although, on second thought, it decided to reassemble in the beginning of the following week.

The Russians under Litvinoff, who is an extreme Bolshevik, assumed at The Hague a very toplofty attitude. They insisted that they could make no agreement concerning the payment of debts, or the restitution of foreign property, or compensation for foreign property seized, until they were assured of receiving credit from the despised capitalistic countries. Naturally, the representatives of the other countries said that they could not agree to extend any credit to Russia until it proved its willingness to pay its debts. That seemed to be the *impasse* against which the delegates at the Hague Conference ran.

Litvinoff, the Russian chief, was not only toplofty but at times jocose. When the other delegates protested against Litvinoff's declaration that it would be impossible to find an impartial chairman for the Joint Commission, and asked him if there were not an impartial man to be found in all the world, Litvinoff replied:

There are two worlds—the Soviet world and the capitalistic world. I am sure neither could supply an impartial chairman. Unfortunately, there is no third world to supply a chairman. There is said to be a third world in the skies, the only one where angels live, but I do not think any of its inhabitants are at The Hague. Certainly we have not met any angels hereabout.

It is hard to take the Bolsheviks seriously except as one has to take seriously fanatics and the insane. Their effrontery would be comical if it were not simply another phase of that dispo-

sition of theirs which has filled Russia with untold and untellable misery.

THE TWO STRIKES

By the middle of the month both the strike of the shopmen on the railways of the country and the strike of the anthracite and bituminous coal miners seemed to be in a condition which might easily be resolved into some kind of compromise or settlement. At the same time not even the President's proposal to the coal miners and operators nor the activities of the Administration in connection with the Railroad Labor Board seemed to have made very definite progress. Early last week there transpired little significant news of any definite action on the part of any of the parties to these strikes; but there were indications that before this issue of The Outlook could reach its readers there might be either some temporary agreement or, in the absence of that, some drastic action on the part of the Government.

It has become increasingly evident as a consequence of the coincidence of the two strikes that the danger of a shortage of coal in New England and in the Northwest has been materially increased. Secretary Davis has pointed out that in the case of the anthracite strike of 1902 the Administration did not interfere until after the strike had been under way for twenty-three weeks. Cold weather was then imminent. The present coal strike has been under way for a shorter time and there are many weeks yet before winter begins. On the other hand, the anthracite strike affected only a part of our coal supply, while these two strikes affect not only the mining but also the transportation of coal for the entire country.

Mr. Helm's correspondence on another page presents a trustworthy report of the coal shortage and its consequences.

SOLVENCY—THE COUNTRY'S FIRST LINE OF DEFENSE

SENATOR BORAH has done something which is not often accomplished. He has succeeded in making the question of taxes dramatic.

In his Senate speech of July 6 he translated dollars and cents into human lives. He made Paying-Up Day as vivid a reality as Spending Day. Whether or not we accept Senator Borah's view entire, his speech must be acknowledged to have been notable in character and effect.

Senator Borah began by a summary of the money-spending bills now awaiting the consideration of Congress—bills the passage of which hangs upon the acceptance of the pending tariff legislation.

First on the list comes the Bonus Bill, entailing a total expenditure of from four to six billion dollars. After this comes the Ship Subsidy Bill, which Senator Borah estimated would call for from fifty to one hundred million dollars a year, and which he declared "will exempt some of the people of the country from the payment of a portion of their taxes; which will select a few and give them an opportunity to succeed in the midst of the distress which presses down upon the remainder of the people." Following this is the proposal to create twenty-four new Federal judges, a number which the Senator from Idaho regards as greatly in excess of our present needs. Last of all is the proposal to loan Liberia \$5,000,000, "at a time when the people of the United States are bled white, when they are absolutely without money to initiate enterprises, and when the great reclamation projects of the West are standing as they have stood for the last seven or eight years."

After his summary of proposed American expenditures, Senator Borah took up the financial condition of the European Powers. He quoted approvingly Lord Inchcape's comment upon the British Budget Committee's report: "I suggest to you that the first line of a country's defense, and of the defense of civilized life, is solvency. If a man's expenditure exceeds his income, if he is wise, he reduces his expenditure. If he is foolish, he goes on spending and borrows on his assets, pledging them for his loans, until he can borrow no longer, and then he is ruined. We are at the parting of the ways. We must reduce our expenditure and cease borrowing or we will come to grief. . . . At present we are slithering down an inclined plane of prodigality and indebtedness that will land us, unless we act promptly and resolutely, in the ditch. . . . If this goes on, our whole social and industrial fabric will go to pieces." Senator Borah compared the military budget of France to-day with its budget of 1913, and then added: "Five years after the war has closed, and after our antagonists have been reduced to practical helplessness, and after the signing of the Four-Power Treaty, and after every appearance of peace, they have increased their expenditures from 15,000,000,000 francs to 19,000,000,000 francs for 1923." If Germany has been reduced to practical helplessness and if there is every appearance of peace upon the Continent of Europe, then the Senator's eyesight is very much better than ours.

Of the other European countries Senator Borah said: "Russia is in collapse; famine stalks her streets. In Germany the assassin's face haunts her public

men and reparations dull the energy and blast the hopes of the people. Austria, Hungary, Rumania—why recount them, for we must know that bankruptcy is everywhere threatened?"

Such is the situation now confronting the world as Senator Borah sees it. The future he envisages in the following manner: "The time may come, and, in my opinion, it is very likely to come, when the United States will have to stand, as it were, at the Marne on this question of preserving financial civilization. The time may come when our reserves, economic and financial, will have to be called upon as our reserve of man power was called upon in 1917, and it behooves the American people and the American Congress to prepare for that as we prepared for the great conflict which confronted us in 1917."

THE DOOR OF THE TREASURY

FROM the economic evils confronting the world Senator Borah sees the one door of escape. He points out the way to those whose appeal to the country for present help promises to make that help unattainable for them and their children. Senator Borah's message to the veterans of the war is a frank and eloquent effort to tell the unpleasant truth as he sees it to men whose best interests he has deeply at heart.

Prosperity, we assume, is to come, not through individual sacrifice and individual effort, through self-exertion and personal initiative, but through the open door of the public treasury. . . .

I grant you that if this policy is to continue there is no argument by which you can exclude the American soldier from participating in its temporary advantage; but it should also be said that there is no logic by which you can exclude him from its permanent disadvantages. No one is more deeply concerned in getting back to right principles and sound policies than these young men. No one is more vitally interested in the future welfare of the country. The unwisdom of the course we are now pursuing will fall more heavily upon these young men and theirs in coming years than upon those who are now in places of authority. It may be vain in this mad hour of political exigency and reckless appropriations to urge these views, but the inevitable hour will come when the soldier himself will regret, deeply regret, he ever consented to become a part of any such scheme. It may be idle—it may even be thought presumptuous—at this time to speak for a different standard, but I doubt not at all that in later years the soldier himself will rue the heedless hour when he exchanged a noble heritage for less than a mess of pottage. The thing which he gave, and stood ready to give, was without money and without price. The thing which he earned, the glory

which was his, transcends the miserable values of the market. He does not rightfully belong in this futile scheme to rebuild civilization and reconstruct a bankrupt world through subsidies, bonuses, appropriations, taxes, and debts.

Of the war and its aftermath Senator Borah then said:

We were told that this would be the real test of democracy—could a republic devoted to peace stand against the onslaught of centralized and thoroughly trained and highly militarized Powers? We all know the result. The pride and the exultation we experienced over those first encounters of our troops no tongue can tell. They had met the test. They had vindicated our whole theory of government. They had justified our standard of civilization. They had checked and were soon to turn back the armies which had brought three great nations to bay. They had demonstrated that there was something, after all, higher and more masterful than sheer force—than mere organization. Behind the gun was character. Behind the weapons of destruction was unbought, unpurchasable love of country. Such service, sir, is the only security a republic can ever know. Such service spurns the idea of compensation, eludes all estimate, and defies the sordid rules of arithmetic. Let those disposed to do so trifle with the future by attempting to write across this glorious record "adjusted compensation."

But stern as was the task of the American soldier in war and unstinted as was the praise he won, a yet more inexorable obligation and a great opportunity awaited his return to civil life. The course which we are now pursuing will prove in the long run more dangerous to our Government than a foreign foe. A proud, strong nation may suffer a reverse in arms, but time may still find it triumphant. An independent and self-reliant people may be overcome by the fortunes of war, but time fights on their side to final victory. But a nation whose citizenship has been drugged and debauched by subsidies and gratuities and bonuses, who has surrendered to the excesses of a treasury orgy, has taken the road over which no nation has ever yet been able to effect a successful retreat.

The responsibility for the future course of the Nation cannot be dodged by those who hold the power of Government in their hands. Senator Borah's appeal to his own party to heed the warning of the times is one which the Senate will not soon forget.

CHEMICAL WEAPONS OF PEACE AND WAR

GERMANY has won a victory all along the line in Washington. As a consequence, America may find itself in the state of dependence upon Germany very

much like that in which it was before the war.

Everybody ought to know that the dye industry is a source on which a nation may draw most effectively in war. The same industry which provides dyes provides also a great variety of medicines and certain kinds of fertilizer, and can be turned to almost instant use for the manufacture not only of noxious gases but also of high explosives.

For this reason Germany has been carrying on for many years what may legitimately be called a chemical warfare. This is a warfare that has been conducted in peace time as well as in the time of hostilities. Germany has carried on this warfare with skill and force.

In order to gain her ascendancy Germany established what amounted practically to an international monopoly. It is not possible here to detail the methods Germany used in building up this monopoly. The story is told incidentally in Victor Lefebure's book on "The Riddle of the Rhine." It is necessary here only to refer to two of those methods. One was the governmental aid given to the concerns engaged in the chemical industry; the other was the aid given to Germany by American laws.

According to the patent laws of America, Germans could take out patents in this country and let them lie idle, thus insuring themselves against competition from America without establishing any factories in America by which those patents could be used in America. This is what the Germans did with regard to the chemical industry. They were able to do this because Americans were interested in other industries and with easy good nature let the Germans do this chemical work for them.

Then came the war, and we suddenly discovered that we were not only without dyes but we were without adequate means for providing our Army and Navy with modern ammunition. So long as we remained neutral there was nothing for us to do about it; but when we became a belligerent and the Government took in charge the property of enemy aliens we had the opportunity to develop a chemical industry ourselves.

Of course the Government took advantage of all enemy property that could be effectively used in the conduct of the war. This of course is legitimate in international law and morals. There is every reason why the Government should turn against its enemy the instruments which the enemy had created for its use against that nation. There were other patents besides these chemical patents that the United States employed. Among them were patents covering gun sights and the like which the

American Government had used and, we understand, is using. All these patents, together with other property, were taken over by the Alien Property Custodian. Such property, so far as it is the property of private persons, is not subject to confiscation; but it is subject to seizure for use, provided just compensation is made. When the war was over, these patents, together with other property of Germans, remained in the hands of the American Government.

In America in the meantime a chemical industry had arisen which was made possible because Germany was no longer able to prevent it by appealing to her patent laws. Thus, relieved from the competition from Germany and from the patent incubus, the American chemical industry promised to supply American dyes for the American market, and also American fertilizer, American medicinal supplies, and, if need be, American gases and American high explosives for military purposes.

GIVING OUR WEAPONS AWAY

SOME of the German patents were turned over to the American Army, but the German chemical patents were sold for a comparatively small sum to an American corporation organized for the purpose of buying them. This corporation, known as the American Chemical Foundation, is of a quasi-public character and is alleged to be not for the purpose of making profits. A former Alien Property Custodian, Mr. Francis P. Garvan, is its president and, we understand, serves without remuneration. Its purpose is to see that these patents are used for the general interest, and not for the purpose of building up a chemical monopoly in this country. The sale was made under authority from Congress by the President, Mr. Wilson.

Meantime the law which had placed an embargo upon the importation of dyes and similar chemicals from Germany was destined to expire. There was an effort to extend that embargo in order to prevent the underselling of American manufactures by the German chemical trade organization. No tariff, it was argued, could possibly protect an American industry. The German organization, which is a combination of German concerns, would under any tariff law be able to sell at a loss a certain kind of dye greatly under the American cost of production so as to drive the American manufacturer of that dye out of business, then it could take up another dye and drive another manufacturer out of business, meantime getting its profits from dye sales in other parts of the world. Of course all the Germans in this country who are connected with the

German chemical trust and some Americans employed by it or interested in importing chemicals were very much disturbed at the prospect of the establishment of this chemical industry in America. Pressure came upon Congress from German concerns in this country and from very rich interests connected with the German chemical trust. Some Americans without any financial interests have also seemed to be very much disturbed by the proposed embargo. These Americans have held that the American Government had no right to seize these patents and is in honor bound to turn them back to their German owners; that, moreover, an embargo of this sort is carrying the protective idea to a preposterous extreme. Strangely, there are high protectionists who are opposed to this embargo because they say that if we are to have protection we are to have it by tariff charges, and not by prohibiting importation. Thus opposed to this embargo are four different and, in some respects, diverse elements in the American population—the pro-Germans, certain conscientious liberals, all logical anti-protectionists and free-traders, and many extreme high protectionists.

In spite of the opposition, it was expected that Congress would provide for an embargo which would allow for a limited time importation of only such chemicals as were not being produced in this country in sufficient quantity to supply the demand.

Suddenly, however, T. W. Miller, the present Alien Property Custodian, acting upon the express direction of the President, made a demand upon the Chemical Foundation to turn over to the Government the patents, trade-marks, copyrights, etc., it had secured. The President, guided by the Attorney-General, Mr. Daugherty, is apparently of the opinion that the transfer of this property to the Chemical Foundation contravened international obligations or was contrary to the public interest. President Harding's action at once stirred up Congress and was probably the cause for the defeat in the Senate of the embargo provision by the narrow vote of 38-32.

THE NEED FOR NEW PATENT LAWS

IF it is settled that German dyes and chemicals are to be admitted to this country, there is very little chance that the dye industry, at least, will find it possible to prosper here unless some means is taken to prevent the methods of industrial assassination which have been employed by the German chemical trust. And certainly if the German patents are to be turned back to the

German owners there will be a serious handicap placed upon all the chemical industry of America, for some of these patents are basic.

The argument that these patents are private property which the Government has no right to confiscate is not altogether pertinent to the actual situation. In the first place, this property is not purely private property. It is vested with a German governmental interest. Its use for the development of chemical warfare and high explosives puts it out of the category of purely private interest. In the second place, property in patents is not like property in land or goods. It is property which is vested with a public interest in this country, for it is property in a right granted by the Government. Moreover, the seizure of these patents for use is not confiscation. These patents were sold for a sum of money, and that money can be turned over to the former owners of the patents. There are some instances in which property temporarily seized during warfare ought to be restored intact; but there are other instances in which this action cannot or ought not to be taken. In such cases, other things being equal, justice is done by money compensation.

One thing is clear. Congress ought promptly to make such changes in the patent law as to establish at least approximate justice between Americans and foreigners. At present Germans and other foreigners can take out patents in this country and let them lie idle, thus preventing their use in competition with their own manufactures; while Americans, if they want to take out patents, for example, in Germany, have to undertake the manufacture of patented goods in Germany in order to hold the patents intact. This is an unfair arrangement.

Meanwhile all the Germans and the pro-Germans in America are rejoicing at this new victory.

HYDROGRAPHY FROM THE AIR

AN aviator flying over a body of water enjoys, if the atmospheric conditions are favorable, a spectacle not vouchsafed to the seaman navigating the same waters. From his lofty vantage-point he gets a clear view of objects submerged to a depth of thirty or forty feet. This remarkable transparency of the water to the eye of the airman was turned to advantage by the Allied air services during the World War, when German submarines were spotted with great success from airplanes.

Now it appears that the photographic plate, more sensitive than human vision, reveals even more striking vistas of the

AERIAL PHOTOGRAPH OF MUD FLATS AND CHANNELS NEAR CAPE CHARLES, VA.

All the features shown in the picture are under water
Photographed by Dr. W. T. Lee

submarine world. Thus it is possible to use the camera in making rapid surveys of shoals and channels for the benefit of navigation. M. Volmat, a French hydrographer, has recently made a hydrographic survey of the waters in the vicinity of Brest, one result of which was to disclose a number of dangerous submerged rocks that had not previously been charted. In this country Dr. Willis T. Lee, of the United States Geological Survey, has taken a series of remarkable submarine photographs from the air along the Atlantic coast.

Such pictures are successful only when the water is calm and the air perfectly clear. Moreover, they probably give in some cases an erroneous impression as to relative depths. For these reasons they can never replace the ordinary methods of sounding, but, as an auxiliary process, aerial photography is undoubtedly destined to become a part of the routine practice of hydrographers.

A VICTORY UNEXPECTED BUT DESERVED

HOLDERS of the American and the British open championships of golf went down to defeat before a young American of Italian parentage named Gene Sarazen, a twenty-one-year-old golf professional of the Highland Country Club, in Pittsburgh. The American open championship tournament, played this year at the Skokie Country Club, at Glen-coe, Illinois, which resulted in the unexpected victory of Gene Sarazen, drew perhaps the most remarkable field of players ever assembled upon an American course. Sarazen's victory was well earned.

An amateur, Bobby Jones, of Atlanta, one of the youngest stars of National

prominence, tied for second place with a veteran professional, John L. Black, of Los Angeles. Only a single stroke separated these two players from the National open champion. William Melhorn, a home-bred professional, of Shreveport, Louisiana, was fourth, and Walter Hagen, the American home-bred professional who recently won the British open championship, was forced to be content with the fifth place. The winner

Levick

GENE SARAZEN, THE EX-CADDY WHO WON NATIONAL FAME

of the tournament finished the seventy-two holes with a total score of 288.

A remarkable feature of the tournament was the huge gallery of seven or eight thousand people which followed the leaders around the course. Such a gallery is no help to good playing, for the concentration of mind and muscle required by par golf is not furthered by even friendly applause. According to the newspaper reports of the tournament, many of the players were seriously hampered by the large gallery, which did not always follow the rules which orderly spectators must observe on a golf course. The American public, educated largely in the ethics and customs of professional baseball, may have much to learn before it can accustom itself to the traditions and manners of golf. We seem to have made a most successful adoption of the royal and ancient game of Scotland. We hope that we shall soon have as great a mastery over the atmosphere of this game as we have over its technique.

WHY NOT "LIMITATION OF LEGISLATION"?

THIS harassed old world needs "limitation of legislation" as well as "limitation of armaments." Statutes, laws, and regulations of all sorts make each year confusion worse confounded. It has been asserted that every person in the United States, unwittingly in ninety-nine cases out of a hundred, violates every day some Federal, State, or local law or regulation; perhaps the honest judge himself in going from his home to the court-room where he hands down every day his judgments of justice breaks some minor regulation, for which offense a policeman, if he were near by and had studied his book of regulations carefully enough, could place the eminent judge under arrest.

A leading authority on American police administration recently estimated that the average policeman, to enforce the city ordinances, State laws, and Congressional enactments committed in whole or in part to his charge, must have a working knowledge of at least 16,000 statutes. This fact was pointed out in a recent speech in Washington by James A. Emery before the American Cotton Manufacturers' Association.

Why not a Congress some time which would subtract five hundred useless or foolish or annoying laws from the statute-books, instead of adding five hundred laws to those same bulky volumes? Such a Congress might earn recognition as the greatest the world had yet seen.

In one of our State Legislatures a few

years ago an extreme illustration occurred of the desire of a member to have his name attached to some piece of legislation. This particular member was sent to the Legislature from a more or less rural district. He introduced a bill providing that a bounty of five dollars be paid by the State for the hide of every loup-cervier (the Canada lynx or wildcat) killed in the commonwealth. Most of the members did not know what a loup-cervier was, and had to consult a dictionary, or some other member who had beaten them to the dictionary, to find out what this particular animal (popularly known in some places as Lucy Vee) was. The legislator who desired to have his name go down in history as the author of an addition to the laws of the State is said to have traded his vote on practically every other piece of legislation which came up at that session for votes on his pet measure, which was passed. The State pays as much as twenty or thirty dollars some years for the animals killed on which this bill offered a bounty!

If there is one place above all others where there is pride of authorship, it is in the halls of America's State and National capitols; and, as in the field of belles-lettres, there is plenty of plagiarism. Similar bills also are frequently introduced by a half-dozen or more members, each hoping his may be the one which will stick and bear the mark of fame.

The United States "easily holds first place in the manufacture of statutory law," declared Mr. Emery in his speech. "A single Congress," he added, "usually receives some 20,000 bills. Many of the States consider not less than 1,000. During the year 1921 forty-two Legislatures were in session. Judging from past years, Congress and the States annually enact an average of 14,000 statutes. The State and National legislation of a single year recently required more than 40,000 pages of official print."

Certainly, it is time for a Congress on Limitation of Legislation.

THE ANTI-SALOON LEAGUE OF AMERICA

A CORRESPONDENT asked us recently for some information regarding the nature and activities of the much-discussed National organization that stands behind the Prohibition Amendment. Every now and then one hears the statement made by irritated opponents of the Prohibition Amendment that it was "put over" on an unsuspecting public by a small, bigoted, and despotic body of men called the Anti-Saloon League. As a

matter of fact the Anti-Saloon League of America is not a small oligarchy, but is a large democratic and representative body. If it is controlled by bigots, then many hundreds of thousands of American citizens must rest under that stigma.

The Anti-Saloon League of America is the creation of the Anti-Saloon Leagues of the various States, and came into existence by their action long after State Anti-Saloon Leagues were organized. The numerous State Leagues sprang into being chiefly through the efforts of various Protestant denominational church boards, which are the chief factor in the constituency of the State Leagues. It is the State Leagues which elect representatives to the National Board of Trustees. These Trustees form the governing power and source of authority in the Anti-Saloon League of America. The National Trustees elect National officers, declare the National policies, and adopt the constitution and by-laws of the Anti-Saloon League of America. Thus the organization may be roughly compared to that of the Federal Government, which gets its power and authority from State representation.

As in the case of the Federal Government, there has been a constantly growing authority given to the National officers of the Anti-Saloon League by the constituent State bodies for the purpose of securing efficiency in carrying out National policies. At the last National Convention of the Anti-Saloon League of America, held in the city of Washington, D. C., in December, 1921, the National Board of Trustees by much more than the required two-thirds vote gave additional executive powers to the General Superintendent of the Anti-Saloon League of America for the purpose of increasing co-ordination, co-operation, and agreement between the executives of the various State Leagues. The constitution of the Anti-Saloon League of America makes it incumbent upon each State League, which is a component part of the National Association, to carry on its work in harmony with the policies adopted by the National Board of Trustees.

Any intelligent and fair-minded man who is accustomed to studying, comparing, and tabulating the sources and factors of historical progress must come to the conclusion, no matter how wet his sentiments may be, that the Prohibition Amendment was not a sudden and sporadic political move, planned in secret and enacted by surprise, but is the result of steady-growing and concerted action by men and women who compose a majority, and perhaps a very large majority, of the qualified voters of the United States.

GERMAN PAPERS PLEASE COPY

FORTY years ago the city of Elizabeth, New Jersey, was down and out—or, rather, in the Salvation Army phrase, was down but not out. It has just celebrated in a rousing jubilee the extinction of the final bonds which stood for the ancient debt, the last penny of which, principal and interest, has now been paid. In this there lies on a small scale a lesson for some of the great nations which are struggling with financial burdens, and it may particularly suggest to Germany that she spend less time in groaning and protesting and take steps, as little Elizabeth did, to meet her debts fairly and honestly.

The trouble with Elizabeth forty years ago was that she had, as the phrase goes in business, extended herself too much—that is, she had pushed forward streets, sewers, pavements, and so on beyond what was required, much in the boom fashion of the early Western towns. Then came a panic and Elizabeth went bankrupt. She could not meet the interest on her debts; she could not sell ordinary short-term bonds in the market; she could not even pay her policemen.

Fortunately, the ancient town—it was originally Elizabethtown and its waterfront was Elizabethport; now both form the city of Elizabeth—had capable and intelligent financiers among its citizens. They faced the situation bravely, formed a plan for consolidating and amortizing the debt, provided for a long-time bond issue on which this was based, and set valiantly to work to build up the city on reasonable and sensible lines. Needless to say, the result was all that could be hoped; the city grew and prospered, and is now a large, fine, and well-governed place; the interest on the bonds was duly met by taxes, and each year the sinking fund for redeeming the bonds grew. It may almost be said that the city has long been free from the burden of its past bankruptcy; now the last vestige of it has been wiped out. A gigantic structure representing two and a half million dollars' worth of bonds was jubilantly burned, the city Comptroller threw into the fire a facsimile package of the bonds, and there were street dances around the conflagration. Flags, decorations, parades, and speeches added enthusiasm to the celebration.

A city, like a man, need not be out of debt to be happy. In both cases the point is to distribute the burden of the debt so as not to let it bear too heavily at any one time. If a small town could do this, and at the same time increase its prosperity, its population, and its property enormously, why cannot a big nation manage its affairs in the same way?

A FIGHT TO THE FINISH IN THE COAL INDUSTRY

SPECIAL CORRESPONDENCE FROM WASHINGTON

BY WILLIAM P. HELM, JR.

THE fight is on—a fight to the finish—in the coal fields. Employer and employee are locked in an industrial death grapple. Miner and operator fight grimly with whatever weapons may be seized, each for his economic life. The patient public, whose patronage has reared a two-billion-dollar industry of coal, is either flouted or disregarded. The President's offer to restore peace has been spurned by the miners, accepted by some operators, and rejected by others.

This is the sixteenth week of the strike. Since the beginning of the coal year, April 1, there has been mined less than one per cent of the normal output of anthracite and about one-half of the normal output of bituminous. A shortage of both hard coal and soft coal is assured during the coming winter. Industries are already closing down for lack of fuel, prices have shot skyward and without check past the barrier of the so-called gentlemen's agreement with Secretary Hoover, passenger trains have been discontinued wholesale, and stocks have dropped to below the danger-line.

Anthracite coal has virtually disappeared from the market. There will be none whatever had for weeks, possibly months. A furnace requiring ten tons, for instance, for the winter will have to get along on a maximum of six or seven. That maximum assumes resumption of work at high pressure within the next two or three weeks. The maximum is unlikely, for work probably will not be resumed on that scale, if at all, within that time. The minimum—

It is entirely possible that there will be no anthracite coal whatever available for consumers at the beginning of winter, save the carry-over in the cellars from last spring, plus the dribbles which have been secured from retailers' small stocks, now exhausted, during the summer.

Bituminous mines in Illinois, Indiana, Ohio, Michigan, the Pittsburgh field of Pennsylvania (second largest in the country), and Iowa are one hundred per cent idle, according to the United States Geological Survey, because of the strike. In central Pennsylvania, the largest single field in the world, about one-eighth of the normal production is being mined. Alabama and three fields in Kentucky alone are unaffected. Even in West Virginia, otherwise unaffected, two great fields, each mining millions of tons annually in normal times, are hard hit by the walk-out.

That great section of the United States lying west of the Great Lakes and north of an east-and-west line running through Chicago faces dire extremity next winter. The Northwest fills its bins each year from the mines of western Pennsyl-

vania, Ohio, Indiana, West Virginia, and other fields within freight-rate distance of Southern lake ports. It has become gospel in the coal trade that the Northwest must obtain its winter fuel while navigation is open on the Great Lakes.

Up to July 9 there had been shipped to the Northwest less than 4,000,000 tons of coal via the Great Lakes. Up to the same time last year nearly 11,000,000 tons had been shipped. A year's supply is about 25,000,000 tons. They must have that coal or freeze. The winters are cold in the Northwest, and the mines of Washington (at present running at about half of normal) and Montana are remote from most of the territory and have not the capacity to supply it in case of extremity.

Two years ago, when temporary shortages and a slow movement threatened the Northwest's fuel supply, the Interstate Commerce Commission by drastic priority orders parceled out coal cars to producers and virtually compelled the shipment of coal to the Northwest, so that that great territory would not freeze. At the time this unheard-of action was taken the Northwest had received more coal than it has this year. Even if the Commission were to attempt now to repeat the programme, there would not be coal to move without depriving other sections needing it as badly.

Make no mistake about this: Because of the lack of coal there will be dire extremity next winter in that thinly settled empire. The State of Minnesota, already alarmed, is clamoring for coal and is the first to sense the coming calamity.

New England is another section which gets most of its coal by water. She has not yet awakened to her peril. There is yet coal at Hampton Roads and at other tide-water piers that she may have, but she has been waiting for developments—and apparently for the price to come down. It will be hard work to supply New England with bituminous from the non-union mines if she begins to order now. Of anthracite of course she may expect none save small shipments from vanishing stocks as long as the present deadlock continues.

Some bituminous coal moves all-rail to New England. Most of this comes from central Pennsylvania. During the week ending July 8, 481 cars, or about 25,000 tons, were sent her in that manner. During the same week of last year she received 2,729 cars, or about 137,000 tons.

West Virginia alone—with the comparatively unimportant exception of restricted output from some Pennsylvania fields—is digging coal available for the Atlantic seaboard and the East. And West Virginia, because of the shopmen's strike, is having unexpected trouble.

Her carriers tapping the non-union fields are beset by labor difficulties and are slowly becoming glutted with traffic. Logan, the banner field, lost twenty per cent of producing capacity during the week ending July 1. Up to that time the volume of coal mined in that field was so large that the money coming in, if equally divided, would have netted \$100 a week for every man and boy on the operators' pay-rolls.

Transportation troubles plague Kentucky fields also. At Madisonville, Kentucky, the headquarters of one non-union field, there were a day or so ago no less than forty-three purchasing agents, each trying to buy coal. Usually the coal operator or sales agent sends his men to the consumer, seeking orders. Now the tables are turned. These forty-three men have come from the consumer to the market. They are bidding fancy prices against each other for coal as yet unmined. Each car that comes from the pit is grabbed up at soaring figures. These men have orders to get coal, and the dollar talks.

The rail strike hit the Chicago coal market a broadside that sent the packers, railways, and manufacturers—all with stocks dangerously low—running to cover. The yards became glutted and conditions grew worse rapidly toward the end of the week. As usual, prices stiffened and then struck out for higher regions at increasing speed.

More than 100 passenger trains on the Wabash and the Missouri, Kansas and Texas Railroads have been taken off because of the coal shortage.

These miscellaneous facts are cited to show that the American public at last has awakened to the gravity of its peril. In the face of the impending calamity the United Mine Workers of America flatly rejected the President's offer that they return to work at their old scale of wages until a fair arbitral body could determine a reasonable, impartial wage. In the face of this public calamity, the President's offer was rejected by the Pittsburgh Coal Producers Association, composed of some of the largest mining concerns in the country; by the Central Coal Association of Pennsylvania, whose tonnage is larger than that of the Pittsburgh crowd; and by the Indiana operators.

Nevertheless coal will be mined. The President's invitation to the operators to return home is being construed in Washington to-night, not as an invitation, but as a command. The bituminous operators are going home, and some of them will try to mine coal.

And then will begin the really critical period of the strike.

Herrin and Wellsburg tell the story of what labor is willing to attempt in defense of what it regards as its rights.

There is not an operator in Washington to-night within the writer's knowledge who does not fear the days to come. They look for bloodshed. They fully anticipate calling for troops, and many of them believe that the troops will be United States Regulars. They are preparing to break the backbone of the strike.

Another West Virginia could do it, but there is none. And, as the writer re-

marked in these columns months ago, West Virginia is at once the hope of the country in this crisis and the despair of union miner and union operator alike. Because of her the union operator of Pittsburgh and Indiana rejected the President's offer. That operator would have little chance, with high wage scales, in competition with non-union coal.

It may be that, under heavy and un-

ceasing guard, union mines will run non-union. If the production of such mines can be brought up to 3,000,000 tons a week, the strike is over. There will be coal for all—at a pinch—who need it for their mills and factories. What is left of the union under such circumstances would have to go to work to keep from starving.

Washington, July 17, 1922.

WALTHER RATHENAU

EDITORIAL CORRESPONDENCE FROM EUROPE

BY ELBERT FRANCIS BALDWIN

AT the opening session of the Genoa Conference the German delegates filed in, rotund and rubicund.

I noted among them a thinner, paler man. He looked more like some old portrait of an early Italian poet than like any Teuton. His conical-shaped head was inclined to baldness. His eyes were deep-set and piercing; they gave the impression of one who no longer cherished illusions but who had both precision and independence. His beard was clipped close. He had no German bull-neck. His neck, in fact, his whole body, was slender. He did not lumber along like his brother delegates, but moved with grace and easy assurance. He took a seat next to Chancellor Wirth, I noticed, and frequently engaged him in conversation.

The un-German-looking person was Walther Rathenau, German Minister of Foreign Affairs. His manner of speech, I discovered later, harmonized with his appearance. No rough gutturals. No long-drawn-out sentences where you have to wait for the verbs at the end before you know what the speaker is saying.

As to matter, in distinction to manner, I remember one day when Herr Rathenau was speaking to a number of us journalists at his hotel and when we had the opportunity of talking with him. No whines from him. No sob stories. Even if there was regrettably no direct confession of his country's wrong-doing, there were constantly evident a frank recognition of obligations due, a desire to co-operate and to co-ordinate in self-disciplinary and positive action so as to meet them, and a good will for the rest of the world.

This terse, intelligent talk was emphasized at the closing session of the Conference. I heard notable speeches from Lloyd George, Barthou, Colrat, Facta, Rossi, and Schanzer; from Tchitcherin; and especially from the Swiss ex-President Motta. But the address to elicit the longest and loudest cheering was Rathenau's. Instead of speaking in his own tongue, he addressed his audience in a language understood by all. It was hard to believe him a German, his French was so good. I jotted down the following points, and translate them:

"The world situation will not become

better until certain truths are recognized:

"(1) Every nation's debt is too large in comparison with its revenue. No country can really balance its budget, save America, without whose help European reconstruction is impossible.

"(2) Every creditor has a duty towards his debtor in getting together the means to pay debts.

"(3) World economy cannot be re-established until confidence is. The world is no longer at war, but it is not at peace. The world's mechanism is not functioning; there is unemployment, hunger. Nine-tenths of pre-war wealth remains, but confidence is lacking.

"(4) The force of no one nation is great enough to bring about world reconstruction. We need a universal force. We must make sacrifices. We must give international credits."

Walther Rathenau was the son and successor of Emil Rathenau, the founder of the enormous A. E. G.—the *Allgemeine Elektrizitäts Gesellschaft* (General Electric Company)—in Germany. Walther's splendid intelligence, great cultivation, and organizing talent were his, not only as his father's son, but also by virtue of varied and suggestive environment—for instance, in journeys to Africa in colonial work for the Government, in independent ventures in aluminum in Switzerland, and in the development of his own patents in the electrochemical industry. When only thirty years old, he had already begun to found branches of the A. E. G. at Amsterdam, Baku, Buenos Aires, Manchester, and elsewhere, and in this endeavor saw much of the world.

Eight years ago the elder Rathenau died, and the son took up the furnishing of material to the German army; he became head of the Raw Materials Branch of the German Government. His work was done with great efficiency, as the Entente Powers found to their cost. Some critics have charged him with ultimate responsibility for the wholesale looting in Belgium and northeastern France.

At all events, during and since the war no one among German industrial chiefs has been more eminent than Rathenau. Comparisons between him

and that other great captain of industry, Hugo Stinnes, are of course inevitable. The two men differed in character and in economic views. Rathenau's ideal was his famous "horizontal plan;" it would group together in co-operation, under Government direction, all industries of the same class.

Politically, Rathenau seems to have been about the only German who in 1914 rightly measured the ultimate dangers that menaced his country. A monarch in whose supposed ideals of peace he had sympathized had capitulated to the increasingly powerful military clique. Disillusioned, Rathenau was not slow in showing his disdain for German pretensions. The war was not two years old when he declared: "We have no right to impose our thoughts and sentiments on civilized nations. Whatever their weaknesses, there is one thing we have not yet learned—the will to shoulder our own responsibilities. We are a generation in transition."

Such a sturdy, well-nigh haughty character, surprised neither by Germany's defeat in the war nor by her revolution after the war, was destined to shine as a publicist even more than as an industrialist. He wanted Germany to recover her economic independence. But he wanted her still more to regain her proper place among the nations.

To this moral end Rathenau was one of the first (and certainly the most important among them) boldly to proclaim the necessity of speedy reconciliation with France. And this, if not on moral grounds, then for the sake of Germany's economic interests. Long before he joined the Wirth Cabinet—the best post-war Ministry Germany has had—first as Minister of Reconstruction and then as Minister of Foreign Affairs, Rathenau's was far and away the most powerful German influence towards a better international understanding and comity.

And the patent means, he asserted, was by a sincere and serious effort to carry out the terms of the Versailles Treaty. "We have lost," he added, "and it is the usual and right thing for the loser to pay." From that moment with the Junkers and military party he was a condemned man.

This in general. In particular, his

WALTHER RATHENAU

This autographed picture of Germany's murdered leader came to us from an American friend of Dr. Rathenau, G. H. Watson, who received it from Dr. Rathenau himself a short time before his assassination

was the only really practical attempt made to reconcile German reparation payments with Entente demands—namely, the payment in goods as in money. This arrangement, as German representative, he concluded last sum-

mer in Wiesbaden with M. Loucheur, the French representative.

Rathenau was not blind to the possible consequences to himself of his astute effort. Last August, after the Erzberger murder, he said to M. Loucheur: "I, too, shall be assassinated." He was, falling victim of the 319th German "political crime."

Certainly it was a moral counterweight to conclude a treaty with Bolsheviki. This event, and the man of its signing, justly damaged Rathenau's reputation outside of Germany and Russia.

With far less justice, indeed, his prestige abroad was clouded by his attempts to influence Parliament towards the French and English position and also against further currency inflation. But Parliament is still obsessed by low taxation and high inflation. To show how hard it was for the Wirth-Rathenau Government to gain any headway against such obsession one has but to remember that the Government has been able really to rely only upon the Majority Socialists, the Centrists (Catholics), the Peasant League, and the Hanoverians—228 Deputies; while it has had against it the National People's Party (reactionary Nationalists), the People's Party (Former Liberals—and not too liberal!), the Independent Socialists, and the Communists—223 Deputies.

Whatever his errors of judgment, his excellencies made Walther Rathenau the first German of his day. All well-wishers had hoped for him a long life, not only for the sake of the Republican ideal in Germany, but as well for the sake of international reconciliation. That life, at the age of fifty-six, has been cruelly cut short.

Brigue, Switzerland,
June 26, 1922.

ARE WE GOING HUNGRY?

BY HUGH J. HUGHES

"**N**OW, don't put in a lot of statistics," warned the editor. So, instead of statistics, which are a weariness to the flesh, I'm going to talk to you in figures—plain, every-day, groceryman's figures that you and I can understand and juggle with both hands.

The question before the house is, "Are we going hungry, and, if so, when?"

It is a practical question, and some folks would like to make us believe that they have the answer, and that the answer is, "Soon!" They argue that we are a sizable family of more than one hundred million folks, tolerably high livers, and that we are gaining new relations faster than we are finding new sources of food supply. And I admit that sometimes it does look that way. The family does seem to be growing, and at the rate the lands are wearing

down and filling up the sea bottoms it will be a long while before the continent doubles in size. So you can see, plain as day, that some day or other we are coming to the bottom of the meal sack.

Or are we?

The average man's notion is that this broad land of ours is a humming hive of industry, worked to the limit. That is purely a notion. It is approximately as correct as the idea that every great executive is a whirling dynamo of ceaseless energy, or that every comedian is happy twenty-four hours in the day.

The fields of Japan, from which our Nipponese friends get their daily rice and trimmings, liberally helped out by side-dishes of fish, are about the size of our own State of Connecticut—maybe a little larger, but not bigger than Connecticut and Rhode Island together. And you know Al Paddock?

Well, Al could jump his way across both States, lengthwise, in exactly 5.9 hours, taking out the time between jumps. (Come on and disprove that, you statisticians!)

Which merely goes to show that until we are put to it we don't really know just how much we can do either at jumping or at growing food.

But what we are doing is a fairly simple story. We are keeping a matter of a couple of months or so ahead of the bread line and soup kitchen. And we are not doing so badly, either. Food is rather valueless except as food. After we have grown what we need for ourselves, with a few hundred millions of dollars' worth thrown in for the bugs and the birds, the rest really doesn't matter. Not unless we can sell it or give it away to the betterment of our souls. If we were obliged to, we really

A TURNTABLE CATAPULT ON THE DECK OF THE BATTLESHIP MARYLAND IN THE YEAR 1922. THE PRINCIPLE OF THIS LAUNCHING DEVICE DATES AT LEAST FROM THE DAYS OF DIONYSIUS I, TYRANT OF SYRACUSE

THE ANCIENTS PAY TRIBUTE

BY CLIFFORD ALBION TINKER

AVIATION experts of our Navy, in an effort to place aviation where it belongs in the fleet, turned back the pages of history 2,261 years to the time of Dionysius I, Tyrant of Syracuse, and found what they needed—the catapult. Together with the aircraft carrier, the catapult launching device solves the problem of supplying our fleets with aircraft for all purposes. This saves our aeronautical skins, so to speak; while at the same time these developments applied to commercial aviation will have a far-reaching effect on the economic features of that method of transportation.

This is characteristic of mechanical development in the Navy. It was the solution of a naval problem which gave the steel industry to the world, and, in the same way, the Diesel engine, the electric propulsion of monster ships, the machine-tool industry, and the radio wonders of the day with their thousand and one applications to communication and directional use. Now the Navy leaps forward in the development of aeronautics to a point where the practical use of catapults or projecting devices and retarding landing devices permit aircraft to take the air and land in relatively small areas—so small, in fact, that huge landing-fields on the outskirts of cities and towns will be unnecessary for traffic handling alone, although such facilities may be required at terminals for testing, repairing, and for emergency purposes.

This means that almost any flat roof can be made a landing-field. By using catapults and arresting devices we may do away with the loss of time occasioned by traveling to and from landing-fields distant from business centers. Where business men now leave their offices, step into an elevator, and gain the subway running under the building, they may in the future reverse their elevator

trip and go to the roof, there to be whisked away in a waiting airplane without the bother of transferring baggage from office to station or from office to landing-field. The returning business man will alight on the roof of his office building and in less than five minutes be dictating letters at his desk. This is not fanciful; it can be done—and will be tested out shortly in Chicago.

Even skeptics must give way when they learn these facts: That in experimenting with arresting devices on the deck of the aircraft carrier Langley

loaded planes alighting at a speed of sixty miles an hour have been brought to a dead stop in the short distance of forty feet! And this without discomfort to the crew! That with a revolving catapult, similar to deck torpedo tubes in operation and taking up about the same space, large airplanes and hydro-airplanes have been projected into the air at an initial speed of sixty miles an hour without reference to the direction of the ship's head or the wind. And in this case, too, there was no discomfort to the crew.

Now comes Admiral W. A. Moffett, Chief of the Navy's Bureau of Aeronautics, with the statement that United States mails will be crossing the Atlantic Ocean in three days before another six months rolls by. To cut in half transatlantic mail time is now possible, the Admiral declared, its accomplishment merely requiring the installation of catapults for launching airplanes and seaplanes from the decks of the mail steamships.

"I have taken up the matter with the Post Office Department and the Shipping Board," the Admiral said, "and I do not believe that I am overstepping the bounds when I predict that the three-day schedule will be in operation before January 1, 1923.

"See how simple the whole business is," he continued, "when within economical airplane distance from either coast, east or west bound, one or more planes would be launched from a mail steamship, and in five hours the mail carried, say, five hundred miles over the sea would be ready for distribution in New York or London.

"This plan for reducing ocean mail communication to three days is sound," concluded the Admiral, "and our own tests of the catapult prove it to be entirely feasible. It will be a great boon to business the world over, for the cata-

This method worked successfully, but had the disadvantage of requiring the ship on which the catapult was installed to turn out of formation to put her planes in the air

pult equipment, the airplanes, and the flying personnel will require only a nominal expenditure when compared with the benefits which are bound to accrue in the speeding up of the delivery of all classes of ocean-going mail."

From a naval standpoint, the catapult has placed us once more ahead of all other navies. This is because we can place aircraft on any ship in the Navy; hence we are not limited with respect to the number of aircraft we may take to sea with our fleets. Before the catapult was perfected we were so limited. By limiting the size and tonnage of our aircraft carriers, the Washington Conference limited our naval air force, although our conferees disclaimed any attempt at limitation of aviation, either naval or military.

It will be noted that our conferees gave us *some* aircraft carriers, while they denied us a single battle-cruiser. This was because it had at last filtered through the skulls of official Washington that a fleet without aviation units always present with it is a fleet unfit for fighting. You can blunder along without battle-cruisers, but you can't go to sea without aircraft. Worse. A fleet without aviation is deaf, dumb, and blind. Supremacy in the air is just as vital to sea power as it was to the Allies on the western front.

Submarines, destroyers, and light cruisers are mere chaff for aircraft to sweep from the seven seas. Many think that this truth dates from the Army-Navy bombing experiments off the Virginia capes last summer. "Look, sailor," some one yelled in my ear, "here's a despatch! The famous U-117 has just been sunk! She went to Davy Jones in seven minutes after the Navy planes dropped four small bombs on her!" But that kind of work was in the day's duty for our naval aviators in the submarine zone during the war. We have men in our naval air service covered with decorations from our allies for sinking U-boats. And they used smaller bombs in those days, and, too, the submarines were manned and armed, not helpless, water-logged craft like the U-117.

But, it may be asked, didn't the Army-Navy bombers off the capes sink ex-German destroyers, and the cruiser Frankfurt, and the battleship Ostfriesland? To be sure they did. Well, then, doesn't that make battleships obsolete? Aren't battleships dead? No. Don't fool yourself. Battleships are not dead. They are more useful than ever. Aircraft have made them so. Aircraft are keeping them alive. Aircraft have taken those immense floating forts and made them into terrible agencies of destruction on a scale never thought possible by the battleship's loudest advocates. But without aircraft along with them they are like huge lumbering prehistoric mastodons crashing aimlessly through a jungle; without aircraft they are useless; worse than that, they are dead—deader than a boiled ham. Thanks to the catapult, they have been given a new lease of life.

You know a monster—the devil fish. An enemy or its prey approaches. There is a sudden and sickening commotion in the water. A dense blinding cloud of inky acidity is forced in all directions by a horrible convulsion of the monster. In that convenient gloom the victim is blind, bewildered, groping. But frightful phosphorus-like orbs are there, and mighty tentacles lash about till they wrap the victim in an embrace of slimy contracting, irresistible coils like muscles lacking shape yet moving under the impulse of malevolent power. Slowly at first those slimy bands compress, then faster and faster they pull and crush until doom and oblivion is the victim's portion.

Do not aircraft give a battleship something of this power? Can't you picture it yourself? Night is on the sea. The darkness is uncanny. Not a star, not a ray from the heavens. But ships are there. They move in orderly array. The navigating details at their posts, all other men below. They are merchant ships; they are warships; it makes no difference what they are, they are doomed. For away off there in the darkness are battleships; their guns have a range of thirty-five miles—they may be that far from the unsuspecting victims.

Suddenly those on watch hear a fearful drumming sound followed by a hoarse scream, and a mighty shell falls in the midst of the formation. Two or three more shells come at short intervals. Then the very heavens fall in a crash of sound, and terrific explosions follow so closely that it would seem that the ocean bed had blown up in volcanic wrath. A half-hour of pandemonium, and the face of the waters is again calm, the darkness settles on the sea as before. But no ships are there. They have vanished. The battleships have done their work.

That is the way it is done. Battleships can now shoot over the horizon and far beyond, they can use their guns to the limit of their range. It may be that those on the battleships never see their victims. It is not necessary. The catapult has given them aircraft, and aircraft are animated periscopes; they reach for miles in the air; they cover immense areas in a fraction of time; they direct gunfire, they give the range, the elevation, and they correct the mistakes. They can do it at night—helped by radio. That's what makes battleships so terrible; aviation gives them tentacles, searches out their prey despite the darkness, makes them twice as destructive as before. No, friends, with aviation battleships are thrice armed; battleships are not dead yet.

Armies in the field will find the catapult and arresting device two of the most important pieces of equipment in the whole gamut of military aeronautics. Portable catapults and arresting platforms in movable sections will permit the use of aircraft with an army, no matter what the terrain. With such apparatus an air force can keep its place at the front with all the other mechanical impedimenta of modern armies. No longer will airdromes be required at great distances behind the lines. Repair shops and storage plants of course must be in the rear, but the fighting force will be along the front, ready at a moment's notice to take the air.

It will be readily seen that these two devices for launching and arresting

U. S. Navy Official
THIS ENORMOUS FLYING DECK OF THE AIRCRAFT CARRIER LANGLEY IS A FLOATING LANDING-FIELD OR AIRDROME AND PERMITS TAKING OFF AND ALIGHTING BY ALL CLASSES OF PLANES

planes will greatly facilitate the use of radio control of airplanes and seaplanes either from ships, the land, or mother airships carrying planes. In fact, mechanical projection and retardation upon alighting have heretofore held up the development of radio-controlled aircraft of the heavier-than-air types; the new landing-deck and catapult have removed the restricting difficulties.

Historically, the story of the development of these two pieces of epoch-making apparatus is sufficiently important to find a place in one's aeronautical scrap-book. Mechanical flight was given to the world on December 17, 1903, by the Wright brothers at Kitty Hawk, when a primitive airplane held the air for a short time and covered a short distance. This airplane had no wheeled under-carriage, but relied on skids for keeping its wings and body off the ground. To take off a mechanical device was necessary, so the Wrights solved the difficulty by using a launching rail on which the skids could be shot ahead by a rope attachment to a weight in a pylon, the fall of the weight furnishing the power required.

Dr. Langley, who nearly won the laurels which came to the Wright brothers, when he tried out his flying-machine on October 7, 1903, used a form of launching rail with power supplied by a spring in addition to the thrust of the propellers. This trial took place from the top of a houseboat at anchor on the Potomac River. It may be that these instances foretold the naval use of the catapult, but they really portray the primitive landing gear of the first heavier-than-air machines, and the use of mechanical aids for taking off were abandoned with the improvement of the flying-machines themselves.

So rapid was the development of aircraft, and so obviously was it adapted to naval use, that only seven years later, on November 14, 1910, we find a civilian aviator, Eugene Ely, making the first flight ever made from the deck of a ship. He took off from the deck of the U. S. S. Birmingham in a Curtiss land-type biplane. The value of this experiment

was greatly increased when Mr. Ely, scorning the intended use of a temporary platform which had been placed upon the fore part of the ship to facilitate the getaway when the ship should be headed into the wind, made his flight while the vessel was at anchor.

Two months later, on January 18, 1911, Mr. Ely reversed his performance by landing an airplane on the deck of the U. S. S. Pennsylvania, the next day adding to his fame by flying the same plane from the deck on which he had landed. These were fundamental performances, inasmuch as they presaged the present-day aircraft carrier.

In February, 1911, Mr. Glenn Curtiss flew from the waters of San Diego Harbor, landed alongside the Pennsylvania, and his seaplane was hoisted aboard the ship. The same plane was later hoisted out, and Mr. Curtiss flew it back to the starting-point. This was also a fundamental performance, for aircraft carriers and all other types of surface vessels are provided with cranes for hoisting on board the aircraft which they carry. This is an absolute necessity in the case of catapult-equipped craft.

Following the Ely-Curtiss experiments in 1911, Captain Washington I. Chambers, U. S. N., then in charge of naval aviation affairs, conceived the idea of using the catapult for projecting planes from the decks of ships. Although the catapult, according to history, as a military weapon dates from Dionysius I and his siege of Carthage, its use in aviation dates from November 12, 1912, when Lieutenant T. G. Ellyson, U. S. N., in a Curtiss seaplane made the first flight from a catapult on a ship.

This first catapult was extremely experimental, but so were airplanes and seaplanes in those early days. Improved designs of aircraft caused improvements in the catapults; a second apparatus, based upon the first, was installed upon the stern of the armored cruiser North Carolina in 1915, and successful flights were made by Captain H. C. Mustin, U. S. N. This catapult proved so reliable and efficient that similar types were installed upon the armored cruis-

veloped by the British, the aircraft carrier, a specialized ship having a large landing-deck and facilities for repairing and storing large numbers of planes of all the necessary types for naval use. Taking the cue from the carrier, taking-off platforms were installed upon the turrets of battleships for the use of spotting and fighting planes. Then came the limitation of such devices by the adoption of the director-firing system. Battleships could not turn out of column for a favorable wind direction launching a plane, and the plane platform interfered with the function of the turret. Back we went to the carrier.

Then the "5-5-3-1.75" Treaty limited the number and size of our aircraft carriers, and we were obliged to turn catapults again for the solution of the problem of taking aviation to sea with the fleets. Hence the turntable catapult. For this new apparatus is a bridge-like structure mounted on a revolving base upon which there is a car to carry the plane, the car being propelled by compressed air. The old type of catapult employed a compressed-air car, but this car was propelled along a fixed track of some length. This necessitated the turning of the ship during launching practice in order to launch the plane directly into the relative wind. Inasmuch as battleships cannot turn out of formation or head all over the ocean in the presence of the enemy without disregarding tactical advantages, the old type of catapult would not do. The new type, however, solves all those tactical problems and, in addition, gives the plane a launching velocity in excess of its lowest flying speed, which assures that at the end of the run when the plane is released it will be lifted into the air on its flight at the same time the release is accomplished so perfectly that the pilot's senses are completely alert, so that he takes control at the proper instant the plane reaches the end of the run and is projected from the car.

The Bureau of Aeronautics is installing these new catapults on all our battleships and is contracting for plane and catapults of various sizes in order to put aircraft on all classes of naval vessels of the combatant type. In addition, Admiral Moffett advocates putting aircraft on merchant ships as a means of protection against raiders in time of war, and of course to facilitate the transportation of the mails in time of peace. It also follows that passengers on ocean going ships may save time en route by utilizing planes launched from catapults within flight distance from the shore. Altogether, the catapult is a remarkable adjunct to the practical use of aviation, and, used in conjunction with the landing-deck, opens up a field not hitherto thought possible, namely, the arrival and departure of aircraft from city buildings.

applied only in one out of every five

is only one way of making the death an active and real deterrent against the commission of murder—that is, by having the death penalty inflexible and inexorably imposed in every murder case. Such a penalty is not desirable. And where first-degree murder is shown to have a strong leaning, the natural aversion to taking another man's life that exists in the normal human being, to convict and charge. This is also emphasized by the fact that in States that have abolished the death penalty first-degree murder convictions have immediately become easier to obtain.

It is only certainty and unflinching application of punishment that will act as a restraint against crime. The prospect of just a few years' imprisonment under the deceptive guise of a life sentence will not do it where society is dealing with characters to whom human life means nothing. A life sentence, if it is to mean anything, must be made to mean a good deal more than a prison term.

It is frequently urged by prison authorities that the imposition of a life sentence in its literal sense would deprive the prisoner of the one thing that counts to him up, and that must be the prospect of all effort at reformation—hope. For that reason, they declare, a life sentence meaning that to the prisoner it makes him uncontrollable, drive him to insanity, convert him into a beast in prison form.

It is wholly agree with that view, but under that, in the main, a problem of management that can and will be solved.

I have good reason to believe that there are instances where genuine reformation is possible even in the cases of men who have taken life. But such cases do not warrant the release of men from the penitentiary after a few years. Society's duty to it is to make punishment severe to make it exemplary, and, secondly, to make the length of the sentence a guaranty of the genuineness of reformation, if it is evident that the life sentence under unfavorable circumstances be not less than, say, twenty years, of course innocence be shown. If conditions are not so favorable, the sentence should mean a life sentence, less, and no governor or authority should have power to pardon or parole in such cases, especially where the prisoner is

out the moral right of society to execute? That aspect of capital punishment has often been discussed, usually been made the basis of its abolition. It has also as often been condemned as false, foolish, sentimental. But if capital punishment fails as a deterrent of crime, it has lost its pur-

pose in a practical way, then its continuation must be justified upon some sound moral ground.

The most commonly urged justification is the Mosaic principle or law of "an eye for an eye, and a tooth for a tooth." But, even assuming that the "eye for an eye" principle in taking life can logically be adopted for the sort of offenses we choose, ignoring it as to others, its application and justification must rest entirely on the basis of revenge—a basis of action that would be difficult to reconcile with the enlightened spirit of modern civilization, and with the basic principle of the world's preponderant religious influence, which is the very antithesis of the spirit of revenge.

One of the strongest points against capital punishment is the natural revulsion of feeling of man individually when a life is taken—even where the State acts as executioner. The human conscience rebels at the thought of life being taken under such circumstances as well as under any other.

ONE or two States, recognizing the danger of a mistake connected with convictions on circumstantial evidence, have definitely barred the death penalty in capital cases where the evidence is of a purely circumstantial nature. Yet even such a safeguard does not go far enough, because of the possibility that the most convincing kind of direct evidence may be trumped up by the witness.

In an address before the Governors' Conference in Boston in 1916 Governor Edward F. Dunne, of Illinois, said:

In 1901 there was convicted of murder in the city of Chicago one Synon; he was condemned to die. His case was appealed to the Supreme Court, which reversed the lower court because of objectionable remarks by the trial judge while the accused was on the witness stand. Synon's second trial was held in the court over which I had at that time the honor to preside. He was acquitted after many reputable witnesses had testified that he was four miles from the scene of the crime when it was committed. The man was saved by a few harsh and prejudicial words of the judge before whom he was first tried; and thus errors, upon which he was able to appeal, became the means through which it was possible for him to establish his innocence. Only those words in which the Court had committed error in uttering stood between him and the cruel tragedy of which my State would have been guilty.

Several years ago two youths were sentenced to death in Pennsylvania. One of them secured a new trial and was acquitted.

The case of a man named Stielow, who is declared to have been three times close to the electric chair, once within less than an hour, only to be finally saved by the confession by another to the murder of which he was accused, has been a sad example of the

One case, involving only life imprisonment, however, was taken to the United States Supreme Court on the admissibility as evidence of a confession of an Indian before his death to the murder of another Indian for which one Donnelly was convicted. Under the rule of law, such evidence was declared inadmissible and Donnelly's guilt upheld. The decision from which Justice Hughes, now Secretary of State, and Justice Holmes and Lurton, however, dissented.

There are many other cases on record where innocent persons were saved from the death penalty by fortuitous circumstances, likewise where it is certain that innocent persons have been executed.

Undoubtedly, the chances of such innocence being shown are infinitely greater when the man who is charged with crime is still alive and where his freedom is the stimulus of his and his friends' efforts at exoneration than where death has rendered such efforts futile.

It was Lafayette who said: "I shall ask for the abolition of the penalty of death until I have the infallibility of human judgment demonstrated to me. When the law has once spoken, no protestations of guiltlessness are sufficient to interfere with its operation. It is true that the governor has the power to pardon and commute, but he consistently set up his judgment against that of twelve men without substantiating evidence of innocence or strongly mitigating circumstances, and that evidence may come too late.

Through the manner in which executions are carried out the citizen is made to feel that a relentless power is utterly apart from and without regard to what is exacting a human life. Yet the citizen bears full responsibility for the act as much as if he himself personally set in motion the mechanical operation which effects the death penalty. Suppose, instead of asking public servants to carry out executions, the task were required to be performed by an individual citizen picked in the same way that jurors are selected—and none could be fairer. Capital punishment would cease to exist as soon as such a plan was sought to be enforced. If capital punishment is essentially a fundamentally right, why should citizens shrink from such a task, when, for example, no citizen will hesitate to take a life in protection of his person, his property and family?

THE greatest power in all creation is the power over life and death. In dealing with murderers we are dealing with persons who have attempted to arrogate to themselves this divine power for revenge, for unlawful enrichment from some one else's property. Can it be fairly said that a man who has been executed has been denied the right to life?

wealth takes unto itself is delegated to the discretion of an individual—the governor; the official representative of the public, to be sure, but still an individual. I contend that no single human being, or even a small group of human beings, should have vested in him or them such an unqualified and sweeping power, for virtually it becomes his or their individual responsibility. And that is an unthinkable condition.

I am a strong believer that even the Chief Executive's authority to grant freedom to prisoners should be radically restricted, especially in the case of life prisoners, so as to obtain only in cases where clear proof of innocence is produced or in the event of mortal sickness. For unwise and indiscriminate use of the pardon and parole power is one of the really serious elements contributing to crime conditions. For one thing, if the criminal is made to realize that this one avenue of possible evasion of the consequences of his crime is completely closed to him it is bound to contribute as a deterrent influence—an influence that will be further increased as defects in our processes and plan of criminal justice are corrected, so that a dead certainty of his punishment will be impressed upon the person planning a crime.

It will also tend definitely to cope with the repeater—the man who commits one crime, is paroled or pardoned, and thereby is encouraged to new, frequently more severe, offenses.

THE case of one of the life prisoners in the Ohio State penitentiary at this time is in point. After having been arrested seven times for various offenses and allowed to escape with either a fine or a short workhouse sentence in one instance, or with no punishment at all, he was finally convicted and sent to the reformatory for life for burglarizing an inhabited dwelling in the night season. Less than three years later he was paroled. A short time after he was re-arrested, following several new crimes, and returned to the institution. Within a year and a half he was again paroled. Less than two months after he was again arrested, but the case was not pressed. After another crime, he was sent back to the reformatory for the third time. And again he was paroled. Another crime with a penitentiary term, from which he was released in less than two years, came next. Then followed a long series of the most severe crimes, including two murders, for one of which he is now serving a life sentence.

A life sentence is really a misnomer in Ohio, as it is in most other places. In the first place, the Governor may parol a life prisoner at any time at his discretion. Then, under the Ohio laws, a life prisoner becomes eligible to be paroled after ten years. This means just

of the last-described type is not safe to be again set at liberty at any time. However, there is a possibility that some life prisoners whose records are less reprehensible may be reformed, and for that reason a time when they may become eligible to parole should be fixed, but, in the interest of society and the protective influence as a crime restraint of such a policy, there should be a definite bar against the release of any such prisoners on any ground, except proof of innocence or because they are dying, prior to at least twenty years' imprisonment.

I have in mind several life prisoners at the penitentiary—trusties who have served varying periods, and whose exemplary conduct allows them a measure of freedom denied to others, model prisoners in every way—who committed unpremeditated murders, usually while crazed with liquor, as the first offense against the law in their lives. Yet in its substantial effect their life sentences are not a whit different from that of the confirmed criminal whom the jury's recommendation of mercy barely saved from the electric chair.

That is hardly such comparative justice as will tend to instill a salutary fear of punishment in the person contemplating a crime.

It is in a correction of such conditions as these rather than in capital punishment that the solution of our criminal problem lies. I believe that the public is gradually awaking to this fact; that the death penalty is serving no good purpose (except dispensing with the necessity of feeding, housing, and providing work for the prisoner) which cannot be accomplished with much better effect in the interest of society by imprisonment; and that the public's will to abolish executions will be expressed in many States before many more years, I feel assured.

This growing attitude is indicated by many signs. Thus some States, like Idaho, while retaining the capital punishment idea, have made it practically a dead letter and have not applied it in years. In Nebraska Governor Samuel A. McKelvie in his last Message to the State Legislature urged the abolition of the death penalty, and also action to prevent the Governor or any one else but the Court to alter a sentence. In New Jersey, though the death penalty continues, one of the serious defects in the present system has been recognized. There, so Burdette G. Lewis, the noted prison authority who directs that State's institutional work, has advised me, a law has been passed "which makes life imprisonment near life imprisonment and not a period of years. There is therefore no minimum term for life imprisonment. A Court of Pardons, consisting of the Judge of the Court of Errors and Appeals, the Chancellor, and the Governor, has full power to parole any convicted prisoner at any time after his conviction."

Mr. Lewis also urges a centering of "the modern attack upon the failure of the courts to convict murderers." "This," he says, "is one of the very serious problems before the country." On this point Governor T. A. O. Preus, of Minnesota, where capital punishment was abolished in 1911, says there has neither been any great increase or decrease in homicides since then, but that "it seems to be a little easier to get convictions."

Colorado is one of the States where both capital punishment and elimination of the death penalty have been tried. Governor Oliver L. Shoup, of that State, is in complete accord with the statement of Thomas J. Tynan, warden of the Colorado State penitentiary, who says:

While we have capital punishment on the statute-books, and while it is enforced in extreme cases, yet I have never been able to see where it has done any good. On the other hand, many men who have been sent to this institution under death sentence and who have been commuted to life, have made great progress, and, in fact, some who have been liberated on parole have become very useful citizens.

Personally, I am against capital punishment from every standpoint.

Governor Emmet D. Boyle, of Nevada, where there has been only one execution in twelve years, is "disinclined to believe that capital punishment is of any particular value."

Governor Warren T. McCray, of Indiana, has also expressed himself to me as not very friendly to the capital punishment idea, but, inasmuch as the laws are on the statute-books, he deems it his duty to carry out the decrees of the courts. That has been exactly my position in Ohio. Since the beginning of my term of office, a year ago last January, twenty-six murderers have been condemned to death. As long as capital punishment is the law of the State, necessarily it is my duty to enforce it, and I have not granted a single commutation of sentence. Nineteen men have therefore been executed in that time and seven more are now in the death house awaiting electrocution.

It is hardly necessary to say that governors in connection with these cases are compelled to steel themselves against the most pathetic pleas that touch the heartstrings of human emotions—pleas of fine old ladies going on their knees to implore for the life of those they bore and nursed and reared through boyhood, and who to them are still boys incapable of wrong-doing, of wives and children—all innocents—who must suffer with those whom their son, or husband, or father, has deprived of a son, husband, or father.

Scenes of this kind cannot fail to convince a man that no human being is sufficiently free himself from sin or error to exercise the supreme power of life and death.

GOLD IS DEAD

BY GUGLIELMO FERRERO

OF all the unforeseen happenings we have lived through during these last ten years, the least expected perhaps is this one—gold has disappeared! There is no more gold in the world, or so it seems.

Once upon a time gold was one of the splendid things of life, a lesser brother of the sun. It glittered on statues and furnishings, on pictures and books, tables and altars, on uniforms and bridal clothes, on the heads of kings, and about the brows of saints; it caressed the necks of women and encircled the arms of men. The most gorgeous ornament in the world, it was at the same time the faithful minister of Riches, the only one she trusted as she did herself, convinced that he would never betray her, as, alas! the fruits of the earth, the sea's promises, the words of men, and the laws so often did.

But about a century ago gold began very gradually to change its ways. Like a converted sinner, it became austere in demeanor. It took a dislike to idleness, to luxury, and to a society which for so many centuries had worshiped it. It vanished from furniture and weapons, from the tables of the rich, and from all the objects man uses daily; it withdrew even from kingdoms and the Church. Henceforth it would serve neither God nor the king. It would serve only the interests of men. Thus it became the eternal wanderer of gain, forever straying through the world, living, like a Bedouin in his tents, in the modest and easily removable purses of men.

The generations of to-day have seen and known it only as the unchanging and incorruptible measure of wealth. But even in this guise they had up to the year 1914 seen and recognized an infinite number of gold coins, indefatigably passing from hand to hand. To-day this is so no more. Gold has disappeared from almost the whole world even in the form of money.

Mediæval legends tell of queens who abandoned the splendors of their courts to wear the rough garments of a nun in some solitary convent. One might say

that the proudest queen of our times, Wealth, has also endeavored at a stroke to surpass the queens of ancient times in humility, as though, suddenly remembering that she too, like other human things, was dust, she no longer desired to have as her symbol an indestructible and incorruptible metal, but chose a frail substance, the most perishable and meanest of materials—paper, a thing made of waste refuse.

Gold still dangles from women's ears and winds about their necks and wrists and fingers. It still shows itself timidly, almost shamefacedly, in the minute trifles of men's dress, and takes refuge—its last hiding-place—in the cavities of decaying teeth. But henceforth even wealth, that supreme achievement of our times, recognizes its image more clearly in the glaucous decay of papyrus than in the eternal effulgence of gold. The world no longer wishes to be resplendent.

Have times, then, changed to simplicity? Have we at last given heed to the sages and saints who for more than two thousand years have been denouncing gold as the tempter and perverter of mankind? Is the world, then, preparing to purify itself of its inveterate vices—cupidity, sensuality, extravagance? Have men extinguished in their hearts *l'auri sacrafames*, which to the Latin poet was the source of all evil?

Nothing of the sort. Gold was never so abundant as at present, when it is never seen. Men were once content to wash the sands of streams in patient search for the grains of gold the river waters had brought down from the mountain; they spent years watching for these scarcely perceptible particles of immense treasure hidden in the depths of the earth. To-day man, digging shafts and tunnels by the hundred thousand, has finally reached the subterranean cave where gold has lain sleeping from the beginning of the ages,

and, having captured the sleeper, has wakened him.

During the four years of the World War more gold was mined than in the seventeenth and eighteenth centuries together. But a strange fate has overtaken this precious metal made in the image of the sun—that of passing from one obscurity to another. Man descends through many perils to seek it where it is hiding in the dim caverns of the earth; with unmeasured labor he bears it out to the light of the sun; but there he buries it again in new caverns that he has constructed with infinite art. Again no one can see it. The lesser brother of the sun is doomed to eternal darkness.

When there was little of it, gold shone everywhere; now that there is an abundance of it, it hides as though afraid of men and light. The metal which, as the ancient poet said, "shines like the flame" seems to want to join the night-prowling animals that flee every morning at the sun's first beam.

How has this strange metamorphosis come about? How account for it? And what does it mean? Among the strange contradictions by which the modern world is torn, this is one of those for which we must seek some explanation unless we would live as though blind and deaf. The disappearance of gold—or rather its death, for it is no less than dead—is the last act of one of the great dramas of the human spirit.

Gold has but one virtue. It does not feed nor warm nor protect from heat and cold; it offers no succor to man struggling with the multiplicity of human ills; it satisfies none of the imperious needs of human nature. But it shines, it glows, it dazzles, like the flame. It delights and excites like all glittering things. It is a flame that never goes out and never needs to be lit again.

And that is why for many centuries it performed two offices among us. A symbol of divinity and perfection, an aureola of sanctity, an attribute of sovereignty and authority, it was at the same time the incorruptible measure of exchange

among men, the tangible symbol of wealth; it was capital and coin; it was the most august of all the rare and magnificent materials, gems, marbles, tapestries, ermines, Tyrian purple, that represented to the eyes of men whatever transcended the mediocrity of human nature.

These two offices were related. Gold was money because it was a precious substance, the most precious of all known substances. And, although it was good neither for food, nor warmth, nor covering, it symbolized something beyond the human—divinity, perfection, sanctity, authority. Because the rich worshiped it without avarice the poor admired it without envy when they saw

it on clothes and furnishings and on the altar. No material substance had in those times a more mystical significance than gold. A sign of invisible things, it served merchants in their exchange of goods; and men very naturally attributed to it the qualities of all the invisible things that it represented.

At one and the same time it served God, the state, and men. It served men by serving God and the state; and it served God and the state by being useful to men. Its duties were modest, limited in scope, and definite. It must satisfy, by supporting industry and commerce, the slowly increasing needs of men, and it must beautify the world. Having three masters to serve, it gave little to

any one of them. But the masters were reasonable in their demands. Not only was God modest in his expectations; what was far more rare, neither the state nor man demanded too much. No one thought of holding gold responsible for human happiness and of calling it to account for the destinies of men. In order to satisfy these last it aided God and the state as much as it could; that is to say, as a minister aids an absolute monarch, by obedience. And the people gilded with words, when they could not gild with the precious metal, whatever they elected to worship. When the official phraseology of the Empire sought to magnify Rome as the sovereign and incomparable city, it applied to her the word "golden." It could find nothing better.

But one fine day a revolution broke out. Reason discovered that the world looked too much like the stage of ignorance, the school of idleness; that justice, religion, and government were merely picturesque fictions, sometimes cruel, sometimes gay, but always empty; that the lives of men swung capriciously from bacchanalia to penance, from feast to fast; that imagination was their tyrant, tormenting them and driving them mad with her mirages, fantastic scenes, and terrors. Reason cried out that the childhood of the world was at an end, and with it the frights and sobs that had convulsed it. Now was to begin the era of discipline and study, the era of work and wisdom.

To make the world over it began by bundling up all those objects which for so many centuries had represented the superhuman to men: robes of purple, ermine, tapestries, marbles, jewels. It spared none save those that consented to become the tools of feminine coquetry. All these ancient symbols of divinity, authority, and perfection were to be tolerated only in so far as they made of themselves the allurements and embellishments of the boudoir.

For a moment reason intended to destroy even gold, the accomplice of all ancient tyrannies. Then she took second thought. She would spare it to convert it. Was it blind and deaf? she asked. Wasn't it wasting its powers in barren idleness by lolling about on monuments, armor, clothing, tables, and altars? No; never had she seen a more stupendous creative force so miserably squandered in vain ostentation. Let it shake off the chains of idleness and of wearisome domesticity that bind it in the houses of the great; let it aspire to being, not the servant of wealth, but its creator and master; instead of serving the priests and kings as their minister, let it rule the world; why should it consent any longer to be the modest collaborator of useless and empty arts? Let it become the animating force of industry, commerce, and agriculture, fecundating the earth, ruling the seas! In just a few years it would be wearing on its brows the imperial crown of the universe.

And gold yielded to persuasion. It

forsook churches and kingdoms, palaces and ceremonies. It transformed itself almost entirely into coin. It gave up all attempts to embellish the world; it abandoned the arts with which it had for so many centuries alternately worked and idled; instead of dazzling men, it dubbed itself "capital," and like a small sized sun forced men to work, a ruthless overseer.

Reason kept all her promises. Gold became the king of the earth. And at the same time the fall of gold began and the great drama of the human spirit.

When gold was no longer the resplendent symbol of all that was greatest in man, but had become the all-powerful sovereign of the world, able to satisfy every desire, man no longer admired it as a precious substance of inestimable value; he was no longer content to enjoy merely looking at it, and from a distance. Having become the slave of gold, he too, like all slaves, desired to be served; and, while gold was exacting more and more work from him, he was demanding greater and greater compensation—pleasure, vices, speed, security, order, liberty, power.

Man was the servant of gold; but gold in turn had to serve man, and in doing so to multiply itself, because its tasks increased daily. In proportion as the requirements of its servant and master increased, it found itself obliged to serve, not a constant number of moderate needs, but an ever-increasing number of insatiable necessities. No longer sufficing, it sought other substances to help it in its colossal task, among them paper.

The more gold and man served and tyrannized over each other, the more did man's ancient respect for gold weaken. Little by little it had come about that, as gold ceased to represent anything invisible and transcendent or to arouse any feeling of reverence and admiration, man began to ask himself if the great value attributed to gold were not perhaps the prejudice of a childish world? What was it good for save to measure the exchange value of things, to adorn women and fill teeth? And as far as means of exchange went, weren't there others more available and convenient—paper, for instance, which had

Keystone

over gold the advantage of being lighter and easier to handle?

And behold! Gold has practically disappeared in one of the frightful cataclysms of history. No one perhaps believed that this disappearance could take place so rapidly. The ease with which millions of men have become accustomed to recognize wealth, of which they are so jealous, in pieces of paper of an intrinsic value equal to zero and of so fickle a conventional value may well seem extraordinary.

But this was the solution prepared at a stroke in the great drama. Gold had begun to lose its importance as coin at the very moment when it had ceased to symbolize divinity, sanctity, perfection, authority. Its splendor was due not so much to a physical property of its molecules as to a reflection of divine light. When this was extinguished, the splendor of gold vanished with it. As long as gold had been able by multiplying itself to satisfy the ever-increasing exigencies of man he allowed it to retain its ancient office as coin. But when, eight years ago, man had tried within a few months to increase a hundredfold his productive and destructive energies and gold had declared itself powerless to accomplish this miracle, he banished it, shutting it up in subterranean vaults, and called in the meanest and most

trivial of substances to take its place—paper.

Buried in eternal darkness, gold is dead. After so much grandeur, it died in obscurity. No one heeded its decease. Many will be astonished on reading this to learn that gold is dead. But for him who sees this demise in its proper place in the perspective of centuries what an event!

The last splendors of gold, extinguished lately under our very eyes, are a remnant of the old world that flourished before the French Revolution. As we see it disappear along with so much else, the tremendous question which gives no peace to whoever, knowing the past, is studying our own times, clamors for an answer. How far are we going? And for how long? Are we tearing down all the past in order to erect the edifices of our own times according to entirely new designs? Or are these tearings-down merely what they have always been in the past, a punishment imposed upon our pride, to force us to build up again all that we have torn down? Will gold, so dead to-day, come to life again?

I believe that it will. I believe that we shall be forced to build again many of the things we have destroyed, because we have destroyed many things that will always be for the simple reason that they have always been. There is too much gold in the subterranean vaults of American banks, there is too great an accumulation of it there every year. Some day it will burst out and return to the light of the sun. Everything, sooner or later, must return to its task.

But this resurrection of gold will not be such a simple and easy thing as many suppose. Death is a phenomenon of nature, resurrection is a miracle. To accomplish this miracle the knowledge of economists and the skill of bankers do not suffice. Gold is dead because it endeavored to dominate the world in place of other and more legitimate authorities, and because it was not able to satisfy in man that longing for the impossible which it had aroused in him. It will come to life again only on that day when these legitimate authorities shall have been re-established; and gold and man shall each be servant and master, with a less feverish desire to dominate each the other.

IN KOREA'S WONDERLAND

PICTURES FROM AN OUTLOOK READER

REGION OF KONGO-SAN, DIAMOND MOUNTAIN

ISLANDS ON THE SEACOAST NEAR DIAMOND MOUNTAIN

"It is not generally known," says our informant, "that the eastern coast of Korea holds one of the beauty spots of the Orient. For grandeur of mountain peaks and wondrous canyons and gorges this region compares favorably with some of our Rocky Mountain, Grand Canyon, and Yosemite Valley scenery. Kongo-San or Diamond Mountain has been recently made accessible by the Japanese Government, and automobiles can go well up into the region. The seacoast is dotted with islands as entrancing in beauty as those on the Japan coast." Diamond Mountain is so called, not, as the adventurous reader might hope, from its containing diamond mines, but because of a spire-like peak which rears itself up at the mountain crest, in a sheer, needle-like point.

From K. F. Berry, Worcester, Mass.

THE BOOK TABLE

BYRON AND SHELLEY

BY JOHN ERSKINE

THESE handsome volumes bearing the title "Lord Byron's Correspondence"¹ appear in the format of the Prothero-Coleridge edition of Byron's works, and are evidently intended to supplement the poet's letters there given. But the second of these volumes contains some important letters of Shelley and Mary Shelley, and there will be readers to wonder why this other poetic name does not figure in the main title of the book, since the material is of such moment in the Shelley tradition. It is Shelley, moreover, whose reputation will profit most from these volumes, though Byron gains also, and the friendship of the two poets is now seen to have been closer and more cordial than we knew.

The entire collection of letters here published for the first time was in the possession of John Cam Hobhouse, Byron's best friend, who left it to his daughter, Lady Dorchester. For many years—that is, from about 1877 to her death in 1914—Lady Dorchester intended to print at least some of the letters, and actually undertook some such project, with the aid of John Murray, the distinguished publisher, grandson of Byron's publisher of the same name. After Lady Dorchester's death Mr. Murray learned that the papers had been intrusted to him. In the present volumes, as Mr. Murray explains in the Introduction, the collection appears complete, with the exception of certain business letters of Byron's to Kinnaid and to Hobhouse relating to leases and investments and containing nothing new or important.

As the sub-title informs us, the Byron letters are chiefly to Lady Melbourne, Mr. Hobhouse, the Hon. Douglas Kinnaid, and P. B. Shelley. These names are too well known to need much comment. Lady Melbourne, the mother-in-law of Caroline Lamb, was a singularly sympathetic and understanding friend. She understood her daughter-in-law well enough to make allowances for Byron in the famous episode, and she was optimistic enough to permit, even to help forward, the marriage of the poet to her niece, Miss Milbanke. The remarkable series of letters to her, given entire, occupies the largest part of this correspondence on Byron's side; the extent to which they confide the secrets of his private life reveal much of his own frankness and of her broad-mindedness. Hobhouse was Byron's lifelong and best friend. The collection opens with a letter to him in February, 1808, during university days; it closes with the beautiful last letter he wrote to Byron on March 15, 1824. Douglas Kinnaid

was Byron's friend, his banker, and the trustee of his property. Percy Bysshe Shelley, the poet, Byron met for the first time on May 25, 1816, at the Hôtel de L'Angleterre, St. Saphorin, Lake Geneva. Shelley's first letter to Byron was written in July following.

So much of Byron's correspondence had already been published that no new revelation of his genius as a letter-writer was to be expected from these long-delayed manuscripts. We read them for whatever new light they can throw on his character and his fortunes. It goes without saying that many readers have searched them for possible evidence in the alleged scandal of Byron's relations with his sister, and some of the more positive believers in his infamy have already fixed upon two letters to Lady Melbourne, dated April 30 and May 1, 1814, as proving by certain cryptic sentences that Augusta Leigh was, as Mrs. Stowe charged, his mistress. If she was, and if these letters discuss the fact with Lady Melbourne, we should note that Byron was at the moment courting Lady Melbourne's niece, and that he married her a few months later. There is reason enough to think that Miss Milbanke knew all that her aunt did about Byron, and those who so choose may believe that a woman of Lady Melbourne's character would have given her blessing to a marriage in her own family with a degenerate who had committed incest. There are few things in literary history more curious than the psychological state of those Byron experts who are determined to fix this crime upon the unlucky object of their interest.

At least one shadow on Byron's memory is removed by these volumes, less through what the letters reveal than through Mr. Murray's account of the condition of the manuscripts. The letter which Mary Shelley wrote to Mrs. Hoppner on August 11, 1821, vindicating Jane Claremont and Shelley from the charges which Hoppner had communicated to Byron, was found among Byron's papers after his death, and it has hitherto been assumed that for some inexplicable and indefensible reason he neglected to forward it to Mrs. Hoppner, as he had promised to do. Shelley biographers, notably Dowden and Forman, have represented Byron in this episode as betraying his friends. Hoppner's letter to him containing the accusation against Shelley is printed for the first time in these volumes, and for the first time Mary Shelley's letter of refutation is printed in full. The important thing, however, is Mr. Murray's testimony that the condition of Mary's letter suggests, what some Byron scholars have always believed, that Byron sent the letter to

the Hoppners under another cover, and had it returned to him, since it referred to the mother of his child. It is pleasant to observe from the letters of Mary Shelley after her husband's death that Byron's friendship for the bereaved family was constant and generous; in fact, all his relations with the Shelleys, as told in these new letters, show him more kindly and companionable than some Shelley biographers have permitted us to think.

If these letters throw no new light on Byron as a letter-writer, they provide much material, as his better-known letters do, for annotating his satirical pictures of society. Caroline Lamb's pursuit of him is among the best-known episodes of his career; with some literary thrift it could be made to furnish out a whole "Don Juan" with incidents. But his experiences with men and women in society were too numerous to necessitate literary thrift. His judgments of the character of women in particular might suggest to one who knew him only in his poetry that he generalized from single instances, but these new letters make it clear that the instances were many. The Countess Guiccioli herself dawned on his sophisticated horizon as simply a more brilliant example of what he had known before. "She is a sort of Italian Caroline Lamb," he wrote Kinnaid, "except that she is much prettier, and not so savage. But she has the same red-hot head, the same noble disdain of public opinion, with the superstructure of all that Italy can add to such natural dispositions." The chief addition, however, to the records of Byron's education in the ways of his world is the group of letters to Lady Melbourne from September 21 to November 25, 1813, giving the story of his flirtation with Lady Webster—or better, of her flirtation with him. Many a novel is praised for less incident, less human nature, and far less wit than is contained in these extraordinary letters. Webster, the bore and fool, evidently fascinated Byron's genius for portraiture quite as much as Lady Frances, his discontented and sentimental wife; scene after scene between them is outlined unforgettably. That Byron got out of the scrape well was evidently due to a higher sense of honor than he usually owned to.

The worst account of him in these volumes occurs by implication in Shelley's letters to him on the subject of Jane Claremont and her child. Byron was eager to own the daughter as his, but he had no use whatever for the mother, and planned to separate the child from her forever. The child was born in the Shelley household, and several of Shelley's letters raise the question, with the greatest tact, as to what other arrangements the migratory father wished to make for his offspring. The tone of each missive rises in intensity until in

¹Lord Byron's Correspondence. Edited by John Murray. 2 vols. Charles Scribner's Sons, New York. \$8.50.

the letter of April 22, 1818, he told Byron, with superb force and dignity, what was to be thought of a man who could not or would not recognize a mother's rights in her child. The strange fate that brought these two geniuses together in their artistic interests and in their personal fortunes has somewhat obscured from all but discriminating readers the moral difference of their natures. This letter to Byron exhibits Shelley at his best, as an advocate of humanity and a defender of the best human instincts. Byron had a better head than Shelley, and knew more about life; Shelley had the kinder heart, and was readier to stake all on a generous impulse. Yet how can one distinguish them even so? With Shelley's letter in his hand Byron may have thought of Harriet Westbrook and smiled a little at his moral friend who pretended to know a woman's heart. These volumes give us another letter from Shelley, a year earlier, sending Byron the news of Harriet Westbrook's suicide, and laying the blame of the tragedy on Harriet's sister.

It could hardly have been for his knowledge of human nature that Byron cared for Shelley, nor could Shelley's great and admitted sincerity have been sufficient cause for friendship; Byron had no time to waste on people who were merely and stupidly good. Shelley must have provided Byron with intellectual companionship he could get nowhere else, with that atmosphere of sympathy in their craft which is the glamour of friendship for artists. Byron seldom met poets—to his own loss; Shelley gave him the most that he had of first-rate criticism and guidance, and gave unselfishly, for Byron was not disposed to return the service. We are left to fancy what their talk was like when they were together—how eloquently to such a listener Shelley pleaded his faith in man and his conception of poetry at once natural and moral, the record of beauty in an innocent soul, and how far Byron before such an advocate tempered his cynical verdicts of men and women, and revealed those hidden sources of ambition in him which through the most discordant adventures kept him hard at work. To some degree at least our curiosity is answered by a letter of Shelley's, dated September 29, 1816, advising Byron not to waste his powers, but to dedicate them to some great achievement in poetry. The sentences have Shelley's familiar accent, and they must have brought satisfaction to the proud and lonely poet for whom they were written: "Is there nothing in the hope of being the parent of greatness and of goodness which is destined, perhaps, to expand indefinitely? Is there nothing in making yourself a fountain from which the thoughts of other men shall draw strength and beauty, to excite the ambition of a mind that can despise all other ambitions?"

The publication of these letters, falling on the anniversary of Shelley's death, would serve to remind us espe-

cially of him, even if in the letters themselves he did not take the notable part. Reading all these new-found words of his, we are impressed once more with his extraordinary felicity as a letter-writer. No wonder Matthew Arnold gave the letters a high place! It cannot be altogether the ease and clearness of style that cause the impression of a man of action rather than a dreamer; Shelley was one of the most practical of men, if to put ideas into practice is to be practical. He had no friend to look after his affairs, as Byron had, yet he was constantly acting for others and putting his own interests in the background. If Matthew Arnold judged the letters well, he went astray in the fa-

mous saying that Shelley was a "beautiful and ineffectual angel." Better critics have rejoined that to be an angel is to be effectual enough. But Shelley was neither an angel nor ineffectual. His theories and his life were of a piece, and one verdict, whatever it may be, must serve for both; accept his premises of human nature, and your criticism is disarmed. What will haunt us in the memory of his name, over and beyond even his beautiful poems, is our own persuasion that this would be a happy world if human nature were what he assumed it to be. His dream convinces, even though we believe his facts are wrong. His dream, we must think, made its noble appeal to Byron too.

THE NEW BOOKS

FICTION

HOUSE OF MOHUN (THE). By George Gibbs. D. Appleton & Co., New York. \$2.

Commonplace in its picture of the flapper girl tamed by adversity, and decidedly padded in its conversations.

SECRET ADVERSARY (THE). By Agatha Christie. Dodd, Mead & Co., New York. \$1.75.

An exciting and well-built mystery tale with a "demobbed" British soldier and a V. A. D. girl as amateur detectives.

***MUSIC, PAINTINGS, AND OTHER ARTS EARLY ITALIAN PAINTERS, THEIR ART AND TIMES (THE).** By Mrs. C. R. Peers. The Medici Society of America, Boston.

Some of the early Italian painters are selected in this book for comment by a sympathetic critic who endeavors to reproduce the atmosphere of their times in explaining their pictures. This is done in a simple but interesting way, and the descriptions are accompanied by attractive illustrations in half-tone and in color.

TRAVEL AND DESCRIPTION

LAURENTIANS (THE). By T. Morris Longstreth. The Century Company, New York. \$3.50.

A delightful if somewhat discursive personal narrative about experiences in Canada's Laurentian mountainlands, which are only a couple of days' travel from New York but seem as remote and unspoiled as the Andes. The book makes the reader wish for a long vacation to test the author's dictum that "if there be any universal secret of happy travel, it lies in finding the soul of the people and places where one goes"—a secret which the author has used effectively.

ESSAYS AND CRITICISM

PLEASURES OF IGNORANCE (THE). By Robert Lynd. Charles Scribner's Sons, New York. \$2.75.

Mr. Robert Lynd is an excellent critic of books, but he is hardly as successful in the rôle of the debonair essayist who will throw you off a thousand words about the hum of insects, New Year prophecies, on feeling gay, eggs, weeds, and this blasted world. The light touch rings a little hollow at times. It is a long, long way from Max Beerbohm, and

even a little distance from A. A. Milne. But, at that, there are passages in "The Pleasures of Ignorance" that were well worth the doing. It is a new rôle for Mr. Lynd, but one which practically every man of letters in England is ambitious to essay—no pun being intended. Possibly this is because the English periodicals offer such an outlet for these dragon-fly bits of prose that hum about so amusingly and yet are bound nowhere.

VARIATIONS. By James Huneker. Charles Scribner's Sons, New York. \$2.50.

This volume of posthumous pieces, dredged up from the daily press for the most part, shows evident marks of haste. Those who knew the late James Huneker will hardly doubt but that he would have scrubbed up many of these pieces before definitely honoring them by book-covers. So vivid and emphatic was the personality of Mr. Huneker, however, that hasty editing cannot conceal the versatile manner, catholicity of taste in music, arts, and letters, and light colloquial tone that formed so large a part of the charm of this writer's work. He was a type almost unique in American letters—the *feuilletoniste*. It is foolish to call him either a great critic or a genius, for he was neither. His charm rested in the fact that he lifted journalism to a higher plane than any other American writer of hurried criticism. "Variations" contains enough material to exhibit most of the facets of his eager, acquisitive mind, the mind of a man who walked joyously and with insatiate appetite among the masterpieces and modern *tours de force* of the world.

MISCELLANEOUS

RANDOM MEMORIES. By Ernest Wadsworth Longfellow. Houghton Mifflin Company, Boston. \$4.

These chapters of reminiscence by a son of the poet Longfellow are almost like table-talk in their informality, their confidential revelations, their amusing and sometimes inconsequential stories. Taken for what they purport to be, "random memories," they are wholly delightful, and to readers who cherish fond recollections of the celebrities of the past century they will be of absorbing interest.

CONTRIBUTORS' GALLERY

CLIFFORD A. TINKER has had a varied and successful military career from 1897, when he became corporal and sergeant in "G" Company, of the Second Maine Infantry, until the present day, which finds him in the Bureau of Aeronautics at Washington, where he is engaged

in writing the last chapters of the official history of naval aviation in the World War. Lieutenant Tinker saw service in the Spanish and World Wars, and was recommended by Admiral Sims for promotion to the rank of lieutenant commander. His chief, Commander Benjamin Briscoe, also recommended him for a Navy Cross for carrying out duties of great responsibility exceptionally well.

HARRY L. DAVIS, Governor of Ohio, has written for The Outlook an article entitled "Death by Law." What lends particular importance to this article is the fact that Governor Davis has gathered from the Governors of many other States facts and experiences bearing on the value, or lack of value, of capital punishment. Governor Davis, while himself opposed in theory to capital punishment, has carried out the law of Ohio without flinching, so that of twenty-six murderers condemned to death since he became Governor last January, not one was granted commutation of sentence. Governor Davis was formerly Mayor of Cleveland.

GUIGLIEMO FERRERO, who is regarded as one of the world's greatest living historians, contributes to The Outlook one of his masterful essays. The translation of "Gold is Dead," which appears in this issue, was expressly authorized by Signor Ferrero. This is the second time that his name has appeared among Outlook contributors, his first article, "Order or Disorder," having appeared in the issue of June 14.

BERNICE LESBIA KENYON knows what editorial rejection and acceptance slips look like from both ends, for she is a member of the editorial staff of "Scribner's Magazine." We think that her poem in this issue well deserved a slip of the latter character. Probably a volume of her collected verse will appear within a year.

JOSEPH E. RANDELL, United States Senator from Louisiana, has been in the upper house of Congress since 1912. He has been President of the National Rivers and Harbors Congress since 1907. Senator Randell is a graduate of Union College, New York. He is the honorary chancellor of that institution. He has received LL.D.'s from his Alma Mater, St. Charles College, Louisiana, and Notre Dame University, of Indiana.

Articular Rheumatism

The following intensely interesting case was recently described in a well-known medical journal:

"A patient came to me some time ago who had long suffered from an *arthritis deformans* (a type of articular rheumatism), which especially involved the right hand.

"The joints had enlarged and the fingers contracted until the hand was practically useless. The patient had taken many kinds of internal and external treatment with unsatisfactory results.

"I prescribed the copious daily drinking of Paradise Water, from

Paradise Spring, Maine. This water is remarkable in that it is practically *mineral free*. Thus its constant use tends to gradually decrease the calcareous (lime) deposits in the joints.

"The patient drank Paradise Water, exclusively and in large quantities, over a period of many months, and considerable improvement occurred. The enlarged joints decreased in size, the contraction of the fingers lessened, and the hand became at last partially useful."

If you are suffering from Articular Rheumatism (arthritis in its various forms) try Paradise Water—it will help you! Our leaflet No. 1 on Rheumatism will tell you how and why. Write for it, using coupon below. Do this now.

FINANCIAL DEPARTMENT

The Financial Department is prepared to furnish information regarding standard investment securities, but cannot undertake to *advise* the purchase of any specific security. It will give to inquirers facts of record or information resulting from expert investigation, and a nominal charge of one dollar per inquiry will be made for this special service. All letters of inquiry should be addressed to THE OUTLOOK FINANCIAL DEPARTMENT, 381 Fourth Avenue, New York.

KEEPING THE FARM MORTGAGE STRAIGHT

BY CHARLES MOREAU HARGER

RECENTLY a Kansas farmer who had struggled long to pay off a \$5,000 mortgage on his farm gathered the money and took the amount to the loan agent through whom he had borrowed it.

"Fine!" exclaimed the agent, taking the check. "Makes you feel good, doesn't it?" Then, briskly reaching for his hat, "Let's go right over to the court-house and have the mortgage released." As an established agent his word would go with the registrar when the borrower's check was in evidence.

Together they saw the entry placed on the books. "I'll get your abstract brought down to date and send it to you, and you'll be all right," were the agent's parting words.

The borrower went home happy—it had been a hard task to save \$5,000. In a few days he received an abstract that showed the mortgage released and his farm clear of debt. He put the paper in the bureau drawer and considered the matter closed. To be sure, he had not received his original note and mortgage, nor did he have his original abstract that had accompanied

FORTY YEARS WITHOUT LOSS TO ANY INVESTOR

the mortgage. What he possessed was a duplicate. But, having all confidence in the loan agent, he took it for granted that all was right.

Out in California was a retired farmer who had invested his money in farm loans. Among his holdings was that of the Kansas borrower. He depended on the loan agent to collect the interest and forward it to him, and expected him also to report on payment of the principal at maturity. The interest came all right for a time, then failed to arrive. He could get no replies to his letters. So he went back to the home town to see what had happened. Plenty had happened. The loan agent had disappeared, the agency was closed and bankrupt. But he still had his note and mortgage, and he notified the borrower to meet the obligation.

The farmer, who had been so happy, found the mortgage was not valid and that he still owed the \$5,000. It meant either paying it a second time or foreclosure. He renewed the note, and started again on the long task of gathering the money to free his farm from debt.

The process was nothing new; scores of rascally agents have followed it. Hundreds of landowners have lost their farms or have put in long years paying mortgages a second time because of neglect in completing the records properly when they discharged the debt. Sometimes deliberate rascality has not been the original cause of the complication; bad management, changing values, speculation, have led to efforts to play even through using the funds belonging to others, with the usual result.

In the winter of 1922 two men who for a quarter century had conducted a mortgage company in the Middle West, enjoyed the respect of their community, and were prominent in civic affairs went to the penitentiary. They had juggled with funds of borrowers and investors until they lacked \$100,000 of being solvent, and the tangle of their books took weeks of expert accountants' time. So trusted were they that borrowers and investors alike failed to secure the evidences either of payment or of deposit, and while confidence lasted they were able to satisfy the investor by forwarding his interest and the borrower rested at ease, believing that his debt was satisfied.

Perhaps all the investors were not deserving of sympathy. It was found that in instances the avoidance of taxes on the mortgage note had been the cause of the trustfulness. The mortgages were left in the name of the company, and it was most difficult to determine who were the actual owners of some of the securities. This method of escaping taxation calls for chances on the integrity of the loaning agency, and sometimes it is abused.

The investor may be a widow with her insurance money in farm loans or a prosperous farmer thus placing his savings. For a while all goes well; but if there is not square dealing at the office one day the investor wakes up to find either that his mortgage is missing or perhaps that it has been exchanged for

*An importer asked
this question:*

"How can your foreign offices help me?"

THIS WAS THE ANSWER: By carrying an interest-bearing account with either the London or Paris Office of The Equitable, you may—

1. Enjoy the advantages of an American bank, employing American methods, in the handling of your foreign business.
2. Pay foreign bills by check, thus effecting a saving in interest.
3. Estimate import costs on a definite exchange basis, thus eliminating the speculation involved in meeting obligations at a future date.
4. Buy exchange to replenish your balance when you consider rates to be most favorable.
5. Establish a valuable local reference overseas.
6. Secure first-hand trade and credit information.
7. Save your traveling representatives time and trouble through the Foreign Travel Service of our Paris Office.

The officers of the Foreign Department will gladly tell you in person or by correspondence how The Equitable can be of service in the conduct and development of your overseas business.

another upon land that is valueless. The men responsible may go to jail; but that does not get back the money.

No borrower should pay interest without receiving at the same time the coupon therefor; he should not pay the principal note without receiving his note and the mortgage. By following this system all chance of having to make a second payment would be avoided. The experience of those who failed to observe this rule has at times been expensive.

This advice should not be understood as reflecting on the mortgage companies as a whole. Considering the vast amount of investment in farm loans, estimated at \$6,000,000,000 in this country, the losses have been negligible. When it is remembered that the loan agent gathers funds from widely scattered investors—widows, professional workers, laborers, estates, savings banks—and distributes these among farmers separated over a State or several States, it shows a remarkable standard of integrity that so few instances of misconduct occur. Many a firm has loaned millions of dollars through a period extending over a quarter century without the loss of a dollar to its customers. It has followed a system of accurate accounting and maintained a record for efficient management. The fact of the wide distribution of operation, however, has made it possible for agents with speculative or dishonest tendencies to mislead their customers.

"The loan agent is always willing to make a fair loan if money is available," explained the head of a prominent mortgage company. "Soil, the substance out of which man's bread must come, is the best security for investment. It makes no difference where that soil is located so long as it is productive and is in the ownership of one who will make it produce to its limit. And in this second factor enters one pitfall that must always be watched. A few months ago an agent at Marion, Kansas, was visited by a well-dressed man who introduced himself.

"I am Mr. Barron," said the caller, 'and own the quarter-section near the schoolhouse east of town, the northeast of Section Twelve.'

"The agent knew the land and that it was owned by J. B. Barron, of Illinois, though the owner had never visited the county.

"Here is the abstract,' went on the visitor, 'and I want to borrow \$1,000 on the land.'

"The property was worth at least \$12,000, and the loan was granted promptly, the money, furnished by an insurance company, paid, and 'Mr. Barron' went his way. Six months later, when the interest was demanded of the owner, he replied that he had never borrowed any money on that land. An abstract of the records had been made by a stranger, now departed to places unknown. The agent was held for the amount of the loan."

The farm depression of the past

eighteen months has made it difficult for many borrowers to meet interest payments. Loan companies through whom the loans were made often have forwarded the amounts to investors and waited for the borrower to pay. This has been for some a heavy burden and in instances has proved disastrous. In the early days of the farm-mortgage business most companies "guaranteed" their loans; that is, they bound themselves to the investor to pay the interest when due and the principal at maturity. Then came depression, and scores of companies went to the wall, for it is impossible without a large capital to meet such obligation. Investors in farm mortgages in the East lost millions, and for years it was difficult to induce them to accept such securities. But to-day the guaranty is practically unknown; the loan agency obligates itself to three things: To give a complete statement of title and appraisal, to remit interest and principal as paid, and, if desired, act as trustee for the investor.

According to the new Census, the total number of farms operated by their owners is 3,925,000, of which 41 per cent (1,611,378) are mortgaged. The farm valuation is given as \$13,772,729,600, on which the total mortgage debt is \$4,012,711,213. In the reports no account is taken of farms operated by tenants or managers. However, the farms operated by owners are 66.6 per cent, by tenants 27.7 per cent, and by managers 5.7 per cent. On this basis, the estimate of the total farm mortgage debt is approximately \$6,000,000,000, but this represents only 29.1 per cent of the farms' value. Of the total farm loans the life insurance companies carry approximately \$1,500,000,000, and they are steadily increasing their holdings. Two leading companies have practically their total assets in farm loans, with over a quarter billion dollars thus invested. Their record is one of almost complete freedom from loss, such few foreclosures as have been made having returned their investment, owing to the caution with which they appraise the lands. The companies have their own machinery for making loans or they buy from established agencies with the privilege of refusing the loan within a given period if inspection by their agents shows it to be too great a risk. During the period of high money rates in 1920-1 the insurance companies were the greatest source of funds for agricultural development, and for several months were overstocked with applications.

Any idea that we shall eventually pay off all the farm mortgages is visionary. With greater prosperity comes greater use of additional capital, and every generation extends its borrowings. Since 1910 the farm debt has increased over one hundred per cent; the average farm mortgage ten years ago was \$1,715; now it is \$3,361, being highest in Iowa (\$9,358), and lowest in Alabama (\$1,176). But the ratio of debt to actual value of the land remains about the same, ranging from twenty-one to thirty per cent.

The modern farm mortgage is made

A New Epoch in the Growth of the South

—and the Unusual Opportunities It Offers Conservative Investors

CALDWELL & COMPANY, nationally recognized as one of the South's important banking institutions dealing in Southern Municipal Bonds, announces its entrance into the field of First Mortgage Bonds on improved, income-earning Southern Real Estate.

Realizing that the South faces a great new epoch of development, Caldwell & Company welcomes this opportunity to broaden its service to investors and to take an even larger part in the upbuilding of the New South.

Conservative First Mortgage Bonds Yielding 7%

Investors will recognize the opportunity afforded them to purchase 7% First Mortgage Real Estate Bonds bearing the name of Caldwell & Company—a name for years called to mind in connection with conservative Southern banking.

The rapidly-developing South offers an attractive field to the First Mortgage investor who wishes a 7% yield with safety.

Safeguarded by Nationally Known Southern Banking House

Caldwell & Company First Mortgage Bonds (issued in denominations of \$100, \$500 and \$1000) are secured by income-earning properties of the highest type in Southern cities whose commercial positions are impregnable and which are benefiting most by the South's rapid industrial progress—properties whose values must be greatly enhanced by every passing year. The character of Caldwell & Company will be clearly reflected in each issue, for every loan must satisfy its rigid requirements.

and handled under a system that places this security in the highest class of investments. Yet it is without supervision by either State or Federal Government. A mortgage company with \$25,000 capital may handle \$500,000 in a year, and it is without examination or inspection. A bank with the same capital and with deposits of \$100,000 is under the strictest supervision. A growing sentiment that mortgage agencies should be under State or Federal supervision is based on the possibilities existing for juggling of accounts and fraud on both borrowers and investors. Of course no supervision can prevent rascality, as the banking departments well know; but every step toward oversight adds to the security of the public. The Federal land bank and the rural bank systems of several States have this supervision, and it has added to their standing with investors.

Meanwhile no borrower should take things for granted. He should know that the records against him are clean when he pays interest or principal.

MARY MCGINDRY

BY HARRY LEE

MARY MCGINDRY topples and tips
In a way so droll on her stiff old
hips

That the fine folks turn as she noses by
Down the dim train shed,
With her one good eye.

They turn and stare at her spattered
duds.

Her mops and brushes, her clouts and
suds,

Cleaning the coaches, cushion and plate,
Cleaning the coaches,
Early and late.

Sometimes she wishes before she is dead
To climb to a coach with an engine
ahead.

And to ride away like the fine folks do,
Out of the train sheds,
Into the blue.

"But what would the sister be doin' at
all,

If she didn't have me in the nights to
call,

Who is it would bring her the sight of
a rose

Or a bit of the gossipin'—
Goodness knows!"

Little would Mary McGindry care

If she knew the way that the fine folks
stare.

She'd laugh to herself at the mopping
and say:

"'Tis the king that looks
At the cat to-day!"

FROM THE MAIL BAG

BARBLESS HOOKS

I AM delighted to see a revival in your
issue of July 5 of your protest
against the use of barbed hooks in fly
fishing. Certainly the use of barbless
hooks is the most skillful, if not the
most humane, way of fishing for trout
and bass.

The greatest sport I ever had, over
thirty years ago, was on a narrow but
deep stream emptying into Lake Hen-
derson, in the Adirondacks, when fishing
from the bow of a canoe, with a guide in
the stern. He silently and slowly pad-
dled me up the stream while I cast
ahead. When we backed out (as we
could not turn around), we had twenty
fine "black-backed" trout in the canoe,
all caught with a barbless hook, and all
weighing from one to two pounds. Many
smaller fish weighing under a pound I
easily shook off by giving them the
slack, without hurting them a bit.

Later I fished for bass on a lake with
larger barbless hooks, and it was great
sport to see them jump out of the water
and try to shake the flies out of their
mouths. Many a big one I lost, but it
was a fair fight, as the fish had a chance
to win, which a barbed hook never gives
them. I wish the State would pass a

law prohibiting the use of barbed hooks
altogether. Keep up your good work.

W. A. PUTNAM.

ON THE RENTING OF
PICTURES

IN The Outlook of May 31 you bring
up the idea of renting pictures in an
editorial entitled "Paintings and People."
Several of your Canadian readers were
delighted to see an editorial on this sub-
ject.

For the last three years a small group
in Toronto have been renting sketches
from local artists under a circulating
system. The system is uncomplicated
and a bringer of joy, and the joy costs
very, very little. Our circulating sys-
tem might be tried by any group of
friends anywhere as long as the artists
elsewhere are as friendly to the idea as
they are here.

We have in Toronto the "Group of
Seven" (artists painting freely and un-
conventionally the spirit of Canada—
her vastnesses, her wild, glorious color,
her city streets). It was suggested to
four of these artists that they rent their
sketches rather than let them pile up in
dusty piles, unseen and unloved, in their
studios. The artists put their heads to-
gether and helped us evolve our circula-
ting system. The rental is small—ten
per cent of the asking price of a sketch

for a year. Thus a \$30 sketch may hang
on your wall for one year for \$3 or for
six months for \$1.50.

The sketches are small—8½ by 10½
inches, making a framed picture of 13½
by 15½ inches—just the right size for
the average apartment room or small
house. I know a stenographer, who lives
in one room on a drab city street, who
has had evenings of joy from her beau-
tiful gay, patterny sketch which she
rented for \$1.50.

But to return to the circulating sys-
tem itself. At the beginning of the year
one group of four rents sixteen pictures,
four from each artist. Then the pictures
rotate. I have four sketches for three
months—Group A. At the end of the
three months Group A goes to Mrs. H.
I get group B from Mrs. T., etc. At
the end of the year four families and
their friends have had the opportunity
to study, discuss, like, love, or hate
sixteen Canadian sketches. Throw a
pebble in a pond. See the circle widen-
ing. See the Canadian public becoming
art lovers. See the artists being not so
everlastingly hard pressed. It's a won-
derful idea.

Your editorial may bring to light
many such groups all over the United
States and Canada. Or it may start such
groups. It will do good, anyway.

DORIS HUESTIS MILLS.

Toronto, Canada.

1,820,000 Telephones Moved

In the telephone business every day is "moving day." Telephone subscribers are probably the most stable and permanent portion of our population; yet during the past year one telephone out of every seven in the Bell System was moved from one place of residence or business to another at some time during the year.

The amount of material and labor, and the extent of plant changes involved in "station movement" are indicated by the fact that this item of service cost the Bell System more than \$15,000,000 in 1921.

To most people, the connecting or disconnecting of a telephone seems a simple operation of installing or removing the instrument. As a matter of fact,

in every case it necessitates changes in the cables and wires overhead or underground. It also necessitates changes in central office wires and switchboard connections; in subscribers' accounts and directory listings; and frequently requires new "drop" lines from open wires or cables.

The problems of station movement are among the large problems of the telephone service. Because of the double operation of disconnecting and re-connecting, the work involved is often twice as great as in the case of new subscribers. With nearly 2,000,000 changes a year, it is only by the most expert management of plant facilities that Bell service is enabled to follow the subscriber wherever he goes.

BY THE WAY

A CURIOUS foot-note to history is found in a pamphlet issued by the Irish Volunteers when the Sinn Fein movement was at its height and when force was being used against British rule. This passage from it is quoted in a book called "The Administration of Ireland." It shows the use that may be made of agricultural implements as weapons:

"No kind of weapons should be despised; certain farming implements can be turned into formidable weapons. Thus (a) a hay-fork is quite as good as a rifle and bayonet in hand-to-hand fighting; (b) a billhook, axe, graip [a dung-fork], spade, or sledge-hammer, though inferior to a hay-fork, may be formidable in close fighting at night; (c) a scythe-blade securely lashed with wire to a pole is equal to a hay-fork. Sometimes it will be possible to destroy a body of troops by a stone shoot, from which a concentrated shower of great stones could be discharged from a height. Every firearm should be utilized; a volley of bird-shot in the face of a motor-driver will wreck his car and stop any cars following it; so, too, with rook rifles and revolvers."

Mary Pickford tells in "Collier's" of certain discoveries she made that brought her success, and says the most important one was the discovery of her limitations. "I fell a victim to the delusion," she says, "that I was destined to be a great tragic actress. But the merciful discovery came to me that in stature, temperament, and general appearance I was not fitted for great emotional rôles. I decided to give up all idea of imitating other people, and, if I were only a semi-precious gem, to be frankly that." So Mary resolved to "become a producer of human happiness" mainly in child parts. The world knows how well she has succeeded.

If a member of a social club rises to move that a piano be bought for the club, at a cost not to exceed \$300, and another member moves to amend the motion by striking out the words "a piano" and inserting in place of them "an automobile for joy rides" and also by striking out "\$300" and inserting "\$600," what is the chairman to do? This question and others like it are amusingly yet authoritatively answered in a chapter called "A Parliamentary Drill Class" in "Rice's Rules of Order." The chairman in the case noted decided that the motion to amend is out of order. "Here we have two distinct amendments," he says, "offered to a proposition in a motion to strike out separated words, neither of which is permissible. Another thing—how could we vote intelligently on the amendment? Some might favor one part of it and oppose the other."

A hog will respond to kind treatment as readily as a dog, according to a contributor to the "Rural New Yorker." "I have one now," he says, "a pure Duroc Jersey, 500 pounds or more in weight.

THE OUTLOOK CLASSIFIED ADVERTISING SECTION

Advertising Rates: Hotels and Resorts, Apartments, Tours and Travel, Real Estate, Live Stock and Poultry, sixty cents per agate line, four columns to the page. Not less than four lines accepted.

BY THE WAY

(Continued)

as tame as a dog. He knows his name, and will come at call, anywhere, at all times. A full-grown male of this sort is very near in intelligence to a dog. But if not properly cared for, and if he once gets cross by improper management, look out! He knows how to take care of No. 1! A man who is afraid of a hog should not, in my judgment, keep one, as the hog knows this fully as well as the man—yes, better! A hog can be made very tame or otherwise, by good or bad treatment."

"If you want to get rich from writing," says Don Marquis, "write the sort of thing that is read by persons who move their lips when they are reading to themselves."

Under the heading "Another Outline of History," an exchange descants as follows on a newspaper despatch that may or may not have been "well invented:"

Four French officers went recently into a German hotel and demanded of the proprietor "the surrender of the historic sofa on which Napoleon slept during the battle of Jena." Thus one by one our illusions fade. The couch on which Napoleon slept during the battle of Jena! Exit forever the picture of Bonaparte calmly sitting his horse, contemptuous of danger amid a hail of shot and bursting shell. Comes instead a bewildering vision of Napoleon reading himself to sleep with a copy of "La Vie Parisienne."

Faith, once shaken, crumbles fast. Even our own great, hitherto secure in the shrines of our hero worship, seem to tremble and totter. Where along the historic Hudson is the couch on which Wayne slept during the storming of Stony Point? Where dozed Stark while the battle of Bennington was raging? Where Washington, while the Hessians at Trenton were giving themselves up?

Some day a visitor to Tampa may buy the porch hammock on which Roosevelt slumbered during the charge at San Juan. Suspicion thus dogs the footsteps of faith. The light of history has gone out.

SUBURBAN home for problem child, competent maternal care. Connecticut Society for Mental Hygiene, New Haven, Conn.

In just 15 minutes both of you can grow a little more interesting to each other every day. In the Free Book offered below Dr. Eliot tells how.

Which couple will be the happier five years from now?

TWO young couples start out in life together. After a few years one husband and wife settle into the dull routine of a commonplace marriage. They have no real conversation; no new interests. They are merely drab, commonplace people, neither interesting to themselves nor to others.

The other husband and wife learn the secret of eternal youth. They are constantly acquiring fresh, new interests. Their evenings are a delight to themselves when they are alone; and their company is eagerly sought by their friends.

What makes the difference between the two families? Native ability? Social experience? Not necessarily.

The Secret of 15 Minutes a Day

The first man and his wife make no effort to add to mental stores; they become dull because they cease to grow. The other two master the secret of investing a few minutes a day in themselves. They do not drift apart; they are held together by a common interest in the few great books of the world—biographies, histories, novels, dramas,

poems, books of science and travel, philosophy and religion—that picture the progress of civilization.

DR. ELIOT'S FIVE-FOOT SHELF OF BOOKS

The Fascinating Path to a Liberal Education

How can one learn this secret? Dr. Charles W. Eliot, from his lifetime of reading, study and teaching, forty years of it as President of Harvard University, has answered that question in a free 64-page booklet that you may have for the asking. In it are described the contents, plan, and purpose of Dr. Eliot's Five-Foot Shelf of Books.

Every well-informed man and woman should at least know something about this famous library.

The free book tells about it—how Dr. Eliot has put into his Five-Foot Shelf "the essentials of a liberal education;" how he has so arranged it that even "fifteen minutes a day" are enough; how in pleasant moments of spare time, by using the reading courses Dr. Eliot has provided for you, you can get the knowledge of literature and life, the culture, the broad viewpoint that every university strives to give.

"For me," wrote one person who had sent in the coupon, "your little free book meant a big step forward, and it showed me besides the way to a vast new world of pleasure."

Every reader of this page is invited to have a copy of this handsome and entertaining little book. It is free, and will be sent by mail. Merely clip the coupon and mail it today.

FOR YOUNG GIRLS. College preparatory and special courses. French, the language of the house. The school is planned to teach girls how to study, to bring them nearer nature, and to inculcate habits of order and economy.
Miss LEA M. BOULIGNY, Box 47, Warrenton, Va.

MASSACHUSETTS

HALLOCK SCHOOL

In the Berkshires
A School for Forty Boys

Each boy's individuality, personality and scholastic needs are considered of first importance. The limited number permits of intimate relations and careful supervision.

Efficient Preparation for College

25 acres. Six buildings. Athletic Fields. Gymnasium. Snow Sports.

Write Mr. Hallock in detail about your boy and his needs that he may indicate just what he can do to help.
Illustrated catalog on request.

GERARD HALLOCK, A.M., Great Barrington, Mass.

WYOMING

HF BAR RANCH

Fall
Season

August 1
to
November 1

An autumn vacation at HF Bar affords a novel experience, long remembered. You will return home renewed and will want to go again. The mountains in their late foliage are at their best, the air is crisp and invigorating, and with fewer guests you have the opportunity to mingle with the cowboys and participate in the Fall Round-up and other Ranch activities. After "roughing it" through the day with horse, rod or gun you will find it a joy to turn back to the comforts of the modern ranch house and bungalows, for which HF Bar is so favorably known.

Special Autumn Events: The Crow Indian Fair; two weeks' auto trip through Yellowstone Park in September (after the crowds have gone), Big Game Hunt (Jackson Hole). References exchanged with prospective guests. For booklet address

FRANK O. HORTON, Buffalo, Wyoming

TRAINING SCHOOLS FOR NURSES

St. John's Riverside Hospital Training School for Nurses

YONKERS, NEW YORK

Registered in New York State, offers a 2½ years' course—general training to refined, educated women. Requirements one year high school or its equivalent. Apply to the Directress of Nurses, Yonkers, New York.

BE AN ARTIST

Comics, Cartoons, Commercial, Newspaper and Magazine Illustrating, Pastel Crayon Portraits and Fashions. By Mail or Local Classes. Write for terms and list of successful students. Easy method.
ASSOCIATED ART STUDIOS, A-81 FLATIRON Bldg., New York

BE STRONG!

BE HEALTHY

Men, women and children should develop health and strength through pleasant daily exercise at home. Because it gives them the best development features of wall machine, rowing machine, chest expander, grip exercisers and massage rollers combined in one—they use and praise

SOD SCHOOLHOUSE IN SOUTH DAKOTA

SOD HOUSES IN DAKOTA

BY PHEBE WEST

HERE are pictures of sod houses taken in Perkins County, South Dakota, while I was teaching there. This country is now a sheep country, though it was formerly a cattle country, and is very much like the country where Theodore Roosevelt owned his ranch, which is north of Perkins County.

The first picture shows the schoolhouse where I taught. It is a sod house, but is plastered with hard plastering inside and out. To say that one taught in a sod house gives rather a poor impression, but it is not a schoolhouse to be ashamed of. I have taught school for six years and in three different States, and I have never seen a schoolhouse, outside of a large city, which had better equipment. The schoolhouse contains a modern furnace and ventilating system, and the fuel is lignite coal, mined in the township.

The photograph was taken on the occasion of our "last day" picnic, and shows part of the crowd in attendance.

The other picture shows the grandmother of two of my pupils standing in front of the sod house in which they lived, with their three pet lambs around her.

The advantages of houses of this type are their cheapness in a country where there is no lumber, their warmth, and the fact that they are not easily wrecked by high wind. The disadvantage is that they fall to pieces so easily.

I have taken The Outlook for a number of years, and have often thought I would write to tell you how much I appreciate it. While I was teaching in this schoolhouse I always kept it on the window-ledge, and nearly every child in school got something out of it. While in the Army I used to carry it over to the wards for the "boys" to enjoy, and now I am sending it to a military hospital every week—so, you see, my copy travels.

Photo by Phebe West

A SOD HOUSE ON A SHEEP FARM IN SOUTH DAKOTA

TO SCHOOL PROPRIETORS

THE OUTLOOK each week goes into 100,000 substantial, refined homes. It is carefully read by parents who desire the best possible school facilities for their children, and who possess the means to send them to the best private schools. 6	Will Power.....	18	Salesmanship.....
7	Initiative.....	19	Self-Confidence....
8	Determination....	20	Forcefulness.....
9	Memory.....	Total.....	
10	Self-Control.....	Divided by 20.....	
11	Imagination.....	Average.....	
12	Foresight.....		

TAKE stock—see what chances you have to become the man or woman you want to be. Here are listed the elements that make men and women successful. Science has shown we all have them, at least to a degree. For the man or woman who desires success, the vital question is—in which am I weakest?

Measure yourself now with this chart.

On the scale of 100%, give yourself a grade in each box. Add both columns and divide by 20. The result is the average of your chances for success in life. Does it satisfy you? Or would you like to be higher?

With this honest self-estimate you come face to face with what may be the most important event in your life. Now you know where your weakness lies. What will you do to correct it? How are you going to increase your chances for a bigger and broader life?

The study of the mind has not kept pace with the study of the body. In the use of exercises that will develop the mind, we are laggard—slow. Science has proved that the mind can be exercised, broadened and developed with astonishing results!

Exercising for Success

Over 27 years ago, a small group of pioneers started to work out some system for the development of the mind.

In the 27 years of this formative period, over 600,000 men and women have been benefited by this scientific, interesting and practical work. As a result of this experience in helping others to make the most of themselves mentally, this group is now in a position to give counsel and advice that is denied others less fortunate in research experience. The new science is called Pelmanism. At the present time it has been developed to a point where the system is so simple, so scientific, so practical, that it can be called the science of self-realization. It teaches you to use completely the powers you have. More important, it teaches you to bring out the sleeping powers you have and are not using. It teaches you how to develop will,

imagination and originality; how to build character, how to strengthen individuality, how to cultivate self-confidence and resourcefulness, how to overcome the negative qualities, purposelessness, indecision.

Already 600,000 people have utilized the forces of Pelmanism. They tell stories of remarkable advances and remarkable achievements. Increases in incomes of 100% to 200% are ordinary—in some cases increases are as high as 1000%. All have been made possible thru Pelmanism.

SUCCESS

THROUGH NEW
MINDS FOR OLD

(A few of the thousands of letters from
successful students)

"From a salary of \$975 I rose in one step to \$2,000 a year, and in January this year to \$4,000 a year."

"I am glad to inform you that I have just received an increase in salary amounting to \$1,000 a year extra."

"Since taking the course I have more than doubled my salary, which is due entirely to your teaching."

"Since becoming a Pelmanist I have actually increased my salary 300 per cent."

"I had the pleasure of taking the course during 1917-18. Previous to joining the army my salary was \$20 a week. My present salary is \$10,000 a year."

"Scientific Mind Training" FREE

If you are dissatisfied with your present condition—if you are anxious to attain greater things, mail the coupon below today. We will send you immediately a copy of the booklet "Scientific Mind Training." Nearly five million copies of this booklet have been sent on request to every part of the world—people in every walk of life, from a president to a newsboy. They have all been amazed at this wonderful book. Imagine a book that has been translated in every conceivable language—even in Braille—the language of the blind—and you will perhaps agree with the importance of scientific mind training. Send for

your copy today. It is FREE. The reading of this book may mark a new era in your life. Send for it NOW. Remember you will be under no obligation.

New DUTTON Books

Italy New and Old

By ELIZABETH HAZELTON HAIGHT

Unique among travel books for its recognition of Italy's marvellous blend of vivid, progressive youth, and of traditions and glories ages old. Certainly it should accompany every traveler to Rome. Illustrated from photographs of rare excellence. \$2.50

Creeds or No Creeds?

A CRITICAL EXAMINATION OF THE BASIS OF MODERNISM

By CHARLES HARRIS, D.D.

Author of "Pro Fide" and of "Creeds and Modern Thought." A vigorous challenge to clear thinking on fundamental questions of Christian belief. \$6.00

The Heart of Nature

By SIR FRANCIS YOUNGHUSBAND
President of the Royal Geographical Society

A famous explorer's reflections on the quest for natural beauty. \$5.00

Revelations of a Spirit Medium

A fac-simile reproduction of a truly remarkable book which was suppressed after its first issue and has long been practically unobtainable. The present issue has been supplied with an extremely valuable bibliography on spiritualism. \$3.50

Memoirs of a Clubman

By G. B. BURGIN

Among the most readable and likable reminiscences of the day are these of a man who, as writer, editor, official in, or a founder of, several of the most celebrated clubs in London, came into contact with all the literary lights and collected a fund of capital, quotable stories. \$5.00

The Naturalist in La Plata

By W. H. HUDSON

This book deserves to be called a romance of a new and fascinating world of brilliant plumage, of graceful rhythms, of creeping menace, and brutal strength. It is written in Mr. Hudson's own inimitable limpid style, the delight of his readers. \$3.00

Some Political Ideas and Persons

By JOHN BAILEY

Collected essays, entirely political, by the well-known critic of the *London Times*. The first essay deals with Queen Victoria with special reference to the recent book by Mr. Strachey. The study of the Queen is followed by essays on Disraeli, Henry Fox, Lord Grey, and Lord Randolph Churchill, etc. \$2.00

Lords and Commoners

By SIR HENRY LUCY

The *Saturday Westminster Gazette*: "With entertaining gossip and anecdote, Sir Henry Lucy wanders from Parliamentary oratory to the New Journalism, and introduces statesmen, artists, literary men, social celebrities, and a host of other interesting people whom he has known." Illustrated by some of the most distinguished English artists. \$6.00

PUBLISHER'S NOTES

HARCOURT POWELL, of Grand Mère Quebec, tosses this bouquet into the editorial ring: "I would like to congratulate the whole staff of The Outlook; it is by far the best paper, either daily, weekly, or monthly, that I have ever read, its chief charm being that you always get a most broad, altogether unbiased description written in excellent English."

ANOTHER is not so encouraging. In explaining why he discontinues his membership in The Outlook family he incloses the following clipping from a local newspaper: "A subscriber writes to the Anthony 'Republican' as follows: 'Don't send us your paper any more. We ain't taking any papers now or we would take yours. But we don't want none at the present time. The "Republican" is a awful good paper but we can't take no paper now, so please stop your paper. We'll take your paper again when we can take a paper. Don't send it no more.'"

A CLEVELAND lawyer expresses his approval: "The Outlook is sane, liberal, progressive, patriotic, and in the highest and broadest sense religious and non-sectarian. I would not use Mark Twain's illustration that The Outlook is like a bottle of perfume in a glue factory, but one might do that without gross exaggeration as to some aspects of public affairs."

FROM La Crosse, Wisconsin: "A copy of The Outlook was lying on my desk when our retired Superintendent of Schools called on me. He glanced toward your magazine, and then remarked: 'There is the finest publication we have in this country. I always enjoy reading The Outlook, because it has a personality.' I have received much inspiration from the pen of Dr. Abbott. I have received much inspiration from reading The Outlook. I have bought most of the books that Lyman Abbott has recommended in his reviews, and have never been disappointed in any of them."

NOT all our subscribers agree with our friend in La Crosse, Wisconsin. One adverse opinion recently came to Mr. Frank C. Hoyt, treasurer of the Outlook Company, in reply to a subscription offer:

"Your offer of seventeen numbers of The Outlook to hand. The addressee, my father, passed away nearly four years ago. We, his survivors, could not, we regret to state, renew subscription to The Outlook, since one whose name appears as a contributor and long identified with your periodical has been doing great damage to the Christian faith, which he interprets, often quite wholly against the simple, unvarnished, and plain statements of God's Word. I may hope, dear sir, that you, personally, do not follow what has appeared so consistently in The Outlook; it would lead to an unutterably sad and eternal destiny."

Are We a Nation of Low-Brows?

It is charged that the public is intellectually incompetent. Is this true? It is charged that the public is afraid of ideas, disinclined to think, unfriendly to culture. This is a serious matter. The facts should be faced frankly and honestly

Without Cultural Leadership

The main criticism, as we find it, is that the people support ventures that are unworthy, that represent no cultural standards. The public is fed on low-brow reading matter, low-brow movies, low-brow theatrical productions, low-brow music, low-brow newspapers, low-brow magazines. We think the criticism is unfair in that it does not recognize the fact that the public is without cultural leadership. Those who have the divine spark get off by themselves. We believe the public has never had a real chance, never had an opportunity to get acquainted with the great and the beautiful things of life. Given half a chance, the public will respond.

We believe there has been enough talk

about the public's inferior taste. The time has come to give the public an opportunity to find out something about philosophy, science and other higher things. And it must be done at a low price, because the average person's pocket-book is not fat. As it stands, the publishers charge about five dollars a volume, and then wonder why the people stand aloof.

We believe we have a way to find out if the people are interested in the deeper problems of life. And the first thing we decided was to fix a price that shall be within the reach of the person with the most slender purse.

We have selected a library of 25 books, which we are going to offer the public at an absurdly low price. We shall do this to find out if it is true that the public is not going to accept the better things when

once given the chance. And we shall make the price so inviting, that there shall be no excuse on the ground of expense.

All Great Things Are Simple

Once the contents of the following 25 books are absorbed and digested, we believe a person will be well on the road to culture. And by culture we do not mean something dry-as-dust, something incomprehensible to the average mind—genuine culture, like great sculpture, can be made to delight the common as well as the elect. The books listed below are all simple works and yet they are great—all great things are simple. They are serious works, of course, but we do not think the public will refuse to put its mind on serious topics. Here are the 25 books:

Are the People Ready to Read These 25 Books?

Schopenhauer's Essays. For those who regard philosophy as a thing of abstractions, vague and divorced from life, Schopenhauer will be a revelation.

The Trial and Death of Socrates. This is dramatic literature as well as sound philosophy.

Meditations of Marcus Aurelius. This old Roman Emperor was a paragon of wisdom and virtue. He will help you.

The Discovery of the Future. H. G. Wells asks and answers the question: Is life just an unrelenting, haphazard struggle?

Dialogues of Plato. This volume takes you into Plato's immortal circle.

Foundations of Religion. Prof. Cook asks and answers the question: Where and how did religious ideas originate?

Studies in Pessimism. Schopenhauer presents a well-studied viewpoint of life. The substance of his philosophy.

The Idea of God and Nature. John Stuart Mill.

How the idea of God may come naturally from observation of nature is explained in this volume.

Life and Character. Goethe. The fruits of his study and observation is explained in this volume.

Thoughts of Pascal. Pascal thought a great deal about God and the Universe, and the origin and purpose of life.

The Olympian Gods. Tichenor. A study of ancient mythology.

The Stoic Philosophy. Prof. Gilbert Murray. He tells what this belief consisted of, how it was discovered and what we can today learn from it.

God: Known and Unknown. Samuel Butler. A really important work.

Nietzsche: Who He Was and What He Stood For. A carefully planned study.

Sun Worship and Later Beliefs. Tichenor. A most important study for those who wish to understand ancient religions.

Primitive Beliefs. Tichenor. You get a clear

idea from this account of the beliefs of primitive man.

Three Lectures on Evolution. Ernst Haeckel's ideas expressed so you can understand them.

From Monkey to Man. A comprehensive review of the Darwinian theory.

Survival of the Fittest. Another phase of the Darwinian theory.

Evolution vs. Religion. You should read this discussion.

Reflections on Modern Science. Prof. Huxley's reflections definitely add to your knowledge.

Biology and Spiritual Philosophy. An interesting and instructive work.

Bacon's Essays. These essays contain much sound wisdom that still holds.

Emerson's Essays. Emerson was a friend of Carlyle, and in some respects a greater philosopher.

Tolstoi's Essays. His ideas will direct you into profitable paths of thought.

25 Books--2,176 Pages--Only \$1.95--Send No Money

If these 25 books were issued in the ordinary way they might cost you as much as a hundred dollars. We have decided to issue them so you can get all of them for the price of one ordinary book. That sounds inviting, doesn't it? And we mean it, too. Here are 25 books, containing 2,176 pages of text, all neatly printed on good book paper, 3½ x 5 inches in size, bound securely in card over paper.

You can take these 25 books with you when you go to and from work. You can read them in your spare moments. You can slip four or five of them into a pocket and they will not bulge. You can investigate the best and the soundest ideas of the world's greatest philosophers—and the price will be so low as to astonish you. No, the price will not be \$25 for the 25 volumes. Nor will the price be \$5. The price will be even less than half that sum.

Yes, we mean it. Believe it or not, the price will be only \$1.95 for the entire library. That's less than a dime a volume. In fact, that is less than eight cents per volume. Surely no one can claim he cannot afford to buy the best. Here is the very best at the very least. Never were such great works offered at so low a price. All you have to do is to sign your name and address on the blank below. You don't have to send any money. Just mail us the blank and we will send you the 25 volumes described on this page—you will pay the postman \$1.95 plus postage. And the books are yours.

If you want to send cash with order remit \$2.25.

Are we making a mistake in advertising works of culture? Are we doing the impossible when we ask the people to read serious works? Are we wasting our time and money? We shall see by the

manner in which the blank below comes into our mail.

----- Send No Money Blank -----

**Haldeman-Julius Company,
Dept. K-9, Girard, Kans.**

I want the 25 books listed on this page. I want you to send me these 25 books by parcel post. On delivery I will pay the postman \$1.95 plus postage, and the books are to be my property without further payments of any kind. Also, please send me one of your free 64-page catalogs.

UNDER FOUR PRESIDENTS

THE AUTOBIOGRAPHY OF OSCAR S. STRAUS

THERE are few, even among famous National figures, who can draw upon such a wealth of dramatic material for an autobiography as Oscar S. Straus. His own story of his long and remarkable life, a life enriched by almost continuous intimate contact with illustrious men and important events, will begin in an early issue of

The Outlook

"Under Four Presidents" ranks with such distinguished autobiographies as "The Americanization of Edward Bok," "The Education of Henry Adams," and Jacob Riis's "The Making of an American."

If you are not already a subscriber to The Outlook, we make the following special offer to enable you to enjoy this engrossing serial at but slight expense:

THE NEXT 13 ISSUES OF THE OUTLOOK FOR ONLY \$1.00

"Under Four Presidents" is the fascinating story of the immigration of a Jewish family to a little town in Georgia in the days of slavery, of the family's attendance at Protestant churches, and of a young lawyer's rise to National eminence.

It describes the efforts of Henry Ward Beecher, the most famous Protestant clergyman of his time, to secure

the appointment of Straus, a Jew, as American Minister to Turkey. Mr. Straus's long and memorable diplomatic service at the Turkish Court, his experiences in the Sultan's palace, and his refusal to arbitrate the historic dispute between Baron de Hirsch and the Turkish Government in return for an honorarium of 1,000,000 francs, are all faithfully reported.

Midnight Suppers With Grover Cleveland

Grover Cleveland, stealing away from the White House to eat midnight sandwiches and drink beer at the Straus home in New York after seeing a Weber and Fields show, his first meeting with Charles Murphy of Tammany Hall, his gifts as a story-teller, and many other new glimpses of Cleveland's character are authentically revealed.

President Roosevelt's long and intimate friendship with Mr. Straus and the hundreds of opportunities Mr.

Straus had, as a member of the Roosevelt Cabinet, for observing how the strenuous statesman worked and lived, have made it possible for Mr. Straus to illuminate historic episodes with intimate stories that have never before appeared in print.

There are penetrating impressions of McKinley, Taft, John Hay, Joseph H. Choate, and many other famous personages of this and other countries.

Fill in and mail Coupon TO-DAY

Promptly fill in and mail us the attached coupon, with your remittance of only \$1, and your subscription for the 13 numbers of The Outlook will start in time for you to receive the notable Straus autobiography from the beginning.

SOMETHING CHEAP

SOMETHING cheap when prices are high ought to be popular. To those looking for something inexpensive we recommend taking a fling at Congress. It costs nothing.

Perhaps that is why so many people are doing it.

It seems almost as if Congress were some kind of alien government set over us by some foreign enemy. Newspaper editorials expressing appreciation of what Congress has done or is undertaking to do are hard to find. Even when a member of the Administration speaks about Congress, he speaks harshly. Naturally, the ordinary citizen, who gets his impression of public men from the newspapers, is likely to regard Congress as an incumbrance upon the earth. Indeed, there is no cheaper form of amusement than shying verbal rocks at the National Capitol.

Of course there are members of both the House and the Senate who tempt anybody to try a shot. These are the sort that are always finding themselves in some row with somebody. We all know the type. Almost any American can mention one or two that would fit this description. Usually the row that they seem to seek is a verbal row, with the tongue or type as weapon. On rare occasions—significantly rare—they engage in physical altercations. There are some men who cannot stand the test of character involved in the enjoyment of immunity for what they say in a legislative hall. As a rule, however, a Senator or a Representative is a man much like other men, except that perhaps he works under a public pressure that other men do not feel. He may get some reward through local reputation and in the exercise of a measure of power; but he rarely gets in net income much, if anything, more than he might earn by devoting himself to a private calling. The Congressman, for instance, who serves for so many years that he attains a position of responsibility and authority in the House might well be supposed to have attained a National reputation. He probably has, in a way; a newspaper item mentions, for example, the expected retirement of Mr. Fess. The ordinary newspaper reader from some other State than that which Mr. Fess comes from reads the account and says:

"Fess? Fess? Let me see, is that the man that was Governor of Massachusetts

or something? No, his name was Foss, wasn't it? But who is Fess? It seems to me I have heard his name."

That is the sort of thanks a man gets by serving in our National legislative body. He is lucky to get no worse than that.

Just now Congress is finding itself the object of rather more derision than usual on account of the Tariff Bill, the Bonus Bill, the Ship Subsidy Bill, and some other bills that it has not passed. It has been derided for not passing them and it has been derided for not killing them. Meanwhile it goes on discussing them, and studying them, and debating them, and making them all seem less justifiable just because they are the subject of debate. If in some way Congress were to pass bills without debate, it would escape much censure but deserve more.

But now we American citizens can all of us find something we do not like in Congress, and take aim.

Of course one thing we all know very well is that we who are so scornful of Congress are its creators. We have made Congress in our own image. If Americans had a sense of humor—the ability to laugh at themselves—they could really take some pleasure in the fun they make of their own handiwork.

MUSCLE SHOALS

THE plan to turn over one of the greatest sources of water power in the world to private hands for one hundred years is not getting the encouragement in Congress that it once seemed to have.

The Senate Agricultural Committee, which had the proposal under consideration, has made a report which records a majority against accepting Mr. Ford's bid for Muscle Shoals, in Alabama. For that the country should be profoundly thankful. In this report the Ford offer is characterized as "the most wonderful real estate speculation since Adam and Eve lost title to the Garden of Eden."

The report of the Committee was presented by Chairman Norris, and parts of it received the support of various members of the Committee. According to the report, it is estimated that, at the interest rate of six per cent, in a hundred years the proposed gift to Henry Ford would amount to over \$236,000,000, and if compounded, "as Mr. Ford asks the Government to compound what he pays," the profit at the end of the hundred-

year period to Mr. Ford's corporation would be \$14,560,000,000—"more than half our total cost of the World War." The report itemizes the various things which the country has been led to believe concerning the offer, and then in turn denies each item. For example, it says: "The country has been given to understand that Mr. Ford has guaranteed to reduce the cost of fertilizer by one-half. He has done nothing of the kind. He has made no guaranty of any kind in the way of reduction of the cost of fertilizer." The report says that the "mind is dazed at the unreasonableness of the proposition," and says that the acceptance of the Ford offer would mean that the fight for conservation was lost. One of the Senators, Mr. Kendrick, of Wyoming, said that he would favor the granting of the lease provided the term was changed from one hundred years to fifty years. The majority, however, were not willing to concur in this.

Senator Norris offers in a bill a plan for the use of the Muscle Shoals water power by a Government-owned and Government-controlled corporation.

It is evident that even those Senators who represent agricultural communities are beginning to see that the inventor of the "flivver" and the cheap farm tractor is but a man, after all, and that no man ought to be endowed by the Government with any such public property.

CONGRESS AND THE TARIFF

THE fight on some of the excessive schedules of the present Tariff Bill seems to have won unexpected and powerful allies. At least it can be said that the high figures proposed by the Finance Committee of the Senate have in two instances undergone drastic revision downward.

The tariff on certain kinds of gloves was severely attacked by Senator Lenroot. He was supported in his position by Senators Borah, Capper, Cummins, Hale, Harreld, Jones of Washington, Kellogg, Keyes, Ladd, Lodge, McCormick, Moses, Nelson, New, Newberry, Phipps, Rawson, Warren, and Willis. The inclusion of Senator Lodge's name in this group has aroused marked comment. The Senators from New York were the leaders in upholding the Finance Committee's rates.

More important than the glove schedule, so far as the country at large is concerned, is the contest on the wool sched-

ule now under way. In this fight Senator Lenroot is again the leader, and he has been joined by Senator Wadsworth.

HOWELL COMES, CULBERSON GOES

ONE more Republican has beaten a Republican and again the victory has gone to the progressive wing of the dominant party. In Nebraska R. B. Howell has won the Republican nomination for Senator. His opponent was Albert W. Jefferis, now in the House of Representatives. Mr. Howell was a Progressive in 1912, but did not have to desert the Republican State organization to swing its support for Roosevelt. He stayed within the party and carried it bodily into the Progressive camp.

He defeated Victor Rosewater, former Chairman of the Republican National Committee and a standpatter in 1912, for membership in the National Committee. In Nebraska National party committeemen are elected in the primaries, and not by the State delegations to the National Conventions.

Howell has fought against the excess of Southern representation in the National Republican Conventions; he has been an efficient municipal official of Omaha, where he has made public works pay for themselves. Mr. Howell is a "dry." His Democratic opponent at the forthcoming elections, Senator Hitchcock, is a "wet." In Nebraska a "dry" candidate is at a decided advantage.

While the Republican party has been watching developments in Nebraska the Democrats have kept their eyes on Texas. In this State the veteran Senator Charles Culberson has apparently succeeded in winning nothing better than third place in the primary contest for nomination. The winner of first place was Earle B. Mayfield, who had the indorsement of the Ku Klux Klan. Ex-Governor James E. Ferguson has apparently won second place in the primary, and, if this is the case, the second and final primary contest will be between Mayfield and Ferguson. Ferguson is an ex-Governor of Texas who was driven from the Governorship in 1917 after impeachment. The choice between such an ex-official and a Klan-indorsed aspirant is not particularly inviting. Certainly any State which elects a candidate because he is a believer in Klan methods will have departed very far from sound American tradition.

THE TWIN STRIKES

No progress at the beginning of last week seemed to have been made in the settlement of either the strike of the railway shopmen or the strike of the coal miners. There were continued re-

ports of contemplated drastic action on the part of the Government. These, however, were perhaps put out as a means of getting responses from public opinion.

It has become increasingly evident that the coal strike and the railway strike have much in common. Indeed, this is not surprising to those who have followed the course of events from the beginning. As Mr. Helm pointed out in his correspondence to *The Outlook* long before the coal strike began, both the miners and the railway men recognized the advantage that might accrue to them in a joint strike. Though the railway men and the miners have not been nominally allied in their warfare, they have not done anything to avoid the strategic advantage that has come from having the two strikes occur at the same time. It has been obvious that the railway strikers have profited greatly by the existence of the coal strike. Delays due to lack of coal have naturally been attributed in the public mind to the strike of the railway shopmen, and have thus helped to give these railway strikers prestige which they otherwise would not have had. Conversely, whatever difficulty the railway managers have had in getting their trains moving has helped to hasten the coming of a coal famine, and thus has strengthened the strategic position of the miners.

LOOKING FOR WAYS OUT

PRESIDENT HARDING'S proposal that the miners and operators resume the mining of coal on a compromise arrangement while awaiting the decision of a coal tribunal has apparently been abandoned. At any rate, there has been no indication made public that even the President himself has been bringing further pressure to bear upon the parties for the acceptance of that idea. One representative of the coal operators has urged a commission different in one vital respect from that which the President suggested. According to the President's plan, both operators and miners would have been represented on the tribunal. According to the plan proposed by Mr. A. M. Ogle, President of the National Coal Association, the tribunal should consist solely of representatives of the public at large, without either miners or operators in its membership, though a miner and an operator might serve in a purely advisory capacity. It is a sign of intelligent leadership for the operators to put forth a suggestion of this sort. We believe that the formal tribunal which Mr. Ogle proposes is to be preferred to that which contains in its membership representatives of the disputants.

It is understood that the Attorney-

General has ruled that the Government has the right in such an emergency as this to seize both the railways and the mines for operation; and that the Inter-State Commerce Commission has, under these conditions, certain emergency powers which include the granting and withholding of priorities for shipment. Under such powers, the Inter-State Commerce Commission could withhold priority of shipment from mines which charged exorbitant prices for their coal. By this control over inter-State commerce the United States Government could deal in an emergency with both the tie-up in transportation and the famine in coal.

In co-operation with the Inter-State Commerce Commission would naturally be the members of the Cabinet most concerned with the situation—the Secretary of the Interior, who is Mr. Fall; the Attorney-General, who is Mr. Daugherty; and the Secretary of Commerce, who is Mr. Hoover.

It has been understood that the railway strike might have been settled before this by the acquiescence of the men in a plan for a rehearing of their grievance as to wages by the Railroad Labor Board if it had not been for issues that have arisen since the strike. The chief issue that has interfered with the settlement of the strike is that concerning seniority. When the men refused to go back to work, the railways gave them warning that after a certain day they would lose the advantage in promotion that comes to men of long service, and the men who took their places during the strike would have a rating as senior to those former employees who returned after the date mentioned. This loss of seniority is a serious matter for many strikers, and they have been insisting that if they return to work their seniority rights should be restored. Logically, the men have very little on their side; but practically, they have a strong argument by pointing to the precedent that has been obtained in other strikes. Naturally, the railway managers do not wish to strengthen this precedent. In this case we think that the men deserve to lose their seniority rights, and the forfeiture of them will help to establish the authority of the Labor Board, and therefore to promote the public interest.

As these strikes have continued interest in the merits of the dispute as between employers and employees has become naturally submerged in the wider and deeper interest in what is going to happen to the people, who depend for heat in their homes and for their industries upon coal that is still in the mines, and who also depend upon the railways for transportation. THE CONFLICT

THE WHIRLPOOL NEBULA

Most celebrated of the spiral nebulae, and the first one to be discovered. Photographed at Mount Wilson Observatory. Exposure, 10 hours 45 minutes.

is a good example of what happens to people who get more interested in theories of life than in the practice of living. On another page we tell what we believe ought to be done by the Government in this emergency.

PHOTOGRAPHING A MILLION UNIVERSES

NEVER before in the whole romantic history of astronomy have such amazing possibilities disclosed themselves as those revealed by recent studies of certain flecks of light found in great numbers in the photographic survey of the heavens—the *spiral nebulae*. As the name implies, these objects have a spiral form, which is more or less evident according to the angle from which they are viewed. In a typical case there is a central nucleus, from which extend two spirally coiled arms, the whole suggesting a Fourth of July pinwheel. These nebulae are, however, greatly flattened, and hence those that happen to stand in an edgewise position with respect to our line of sight assume the shape of an elongated spindle.

Very few spiral nebulae were known before the beginning of the present century. One of the few was the famous Whirlpool Nebula, discovered by the Earl of Rosse in 1845 with what was then by far the largest telescope in the world. The fact that there are something like a *million* of these bodies in the sky within the range of observation was one of the astounding revelations of celestial photography. Most of them are invisible to the human eye, aided by

the most powerful of telescopes, but impress their images on the more sensitive photographic plate, exposed for periods extending, in some cases, to ten or twelve hours.

What are the spiral nebulae? Most astronomers believe that they are enormously remote compared with other celestial objects. There are other nebulae in the sky—masses of glowing gas or cosmic dust lighted up by stars in their midst, or, most interesting of all, *dark clouds* of gas or dust seen in silhouette against a starry background—all of which are no more distant, on an average, than the majority of stars visible in the telescope. These nebulae, together with perhaps a thousand million stars, including our own sun, constitute what is called the Galactic Universe. The text-books of a few years ago compared its shape to that of a grindstone, our solar system being somewhere near the middle. Looking toward the edge of the grindstone, we see the stars apparently crowded in a belt that encircles the sky—the Galaxy, or Milky Way. In other directions the stars seem widely scattered, because we look through a comparatively thin layer of them into outer space.

This comparison to a grindstone no longer seems apt, because it implies that our system has a more or less circular outline, whereas the belief is rapidly gaining ground that *the Galactic Universe is a spiral nebula*.

And now we come to the most stupendous guess of all—it is still only a guess, though a very plausible one—that every

one of the spiral nebulae, of which so many thousands have been photographed, is itself a vast universe of stars!

Some decidedly discordant estimates have lately been published as to the size of the Galactic Universe. The most conservative of these assigns to it a diameter of about 30,000 light-years. Light, which performs the journey of 93,000,000 miles from the sun to the earth in eight minutes, requires, according to the estimate just quoted, 30,000 years to cross our universe of stars.

Where, then, are the *other* universes—the spiral nebulae? Is space big enough to hold them all?

A current estimate places the nearest of them at a distance of something like 500,000 light-years from our system, while to the most remote of those that have hitherto been photographed is ascribed the altogether inconceivable distance of a hundred million light-years!

These figures suggest an interesting reflection. If they are correct, our photographs of the most distant spirals do not show these objects as they are today, but as they were a hundred million years ago. In other words, our pictures are retrospective views that span unthinkable æons of time as well as incalculable depths of space.

A NATIONAL EMERGENCY

SUPREME over every other interest is the interest of all the people.

The coal strike and the railway strike have now created a situation in which the interest of all the people is involved.

Justice demands that in any action to be taken the interest of the miners, the interest of the mine operators, the interest of the railway employees, and the interest of the railway managers shall be subordinated to the people's interest.

Therefore all questions as to whether the miners' wages are too high or too low, as to whether the mine operators shall negotiate with the miners by districts or Nationally, as to whether the railway employees are paid in proportion to their service or have sacrificed their seniority rights by striking, must be regarded as secondary to the right of the people of this country to have their highways kept open and their resources made available for their use.

No group, whether it consists of laborers or of capitalists, has any right to prevent the people of the country from using their highways and their resources. Every corporation or associa-

tion of men is but an instrument created or permitted to exist by the people for the purpose of contributing to the common welfare. The creature has no right that is paramount to the rights of its creator. Though all this has been denied in Russia, it is still alphabetic in America.

Nobody who knows the American people imagines that they will willingly acquiesce in any proposal that they surrender their rights and their authority and their sovereignty in order to enable employers and employees in such basic industries as coal mining and transportation to settle their disputes by continuing a generally destructive industrial war to the last ditch.

The alternative to industrial war in disputes of this kind is a tribunal which shall hear all the evidence and render an authoritative judgment.

In the case of the railways such a tribunal already exists. This is the Railroad Labor Board. In the dispute which occasioned the present industrial war waged by the railway shopmen this tribunal had already rendered its decision. In choosing industrial war instead of the further use of the tribunal which the people had erected the railway shopmen have defied and are continuing to defy the right and interest of all the people. They are clearly in the wrong.

In the case of the coal industry no such tribunal exists, but one has been proposed by the President. In rejecting the President's proposal for a tribunal, without proposing anything else in its place except a continuance of industrial war, the miners have put themselves in a position that is hostile to the interest and rights of the people. They too now are clearly in the wrong.

Whether the railway managers have refused to abide by the legitimate decisions of the Railroad Labor Board or not is a matter of dispute. In one instance at least the question has been brought before the courts, where such a question belongs. If and in so far as the railway managers have interfered with the proper function of the Railroad Labor Board, they too are in the wrong as well as the striking shopmen. Whether the mine operators have accepted the President's proposal honestly and in good faith is also disputed. On the face of the reports the operators have not opposed the establishment of such a tribunal as the President offered to establish. If and in so far as they have put obstacles in the way of the establishment of such a tribunal, they too are in the wrong as well as the striking miners. We do not doubt, however, for a moment that if the railway employees now on strike would say definitely that they would submit their case to the

Railroad Labor Board and if the miners either accepted the President's proposed tribunal or definitely themselves proposed an alternative tribunal equally or more certainly impartial, both industrial wars would cease. In both cases the responsibility for the continuance of the war rests upon the strikers and their leaders.

Since in both strikes the men seem unwilling voluntarily to chose the judgment of a tribunal in preference to the verdict of industrial war, and possibly the operators and managers are ready to accept the war which the men have chosen, the Government should exercise its authority to compel both sides in each controversy, subordinating their own demands to the rights and interests of all the people, either under some compromise arrangement to supply the people with fuel and transportation or to make way for those who will. Coercion under such circumstances is no more slavery than is conscription in time of war. A government that shows its determination to protect the general right is likely to find it unnecessary to go to extremes in exercising its authority.

In providing for the emergency on the railway the Government has already means at hand which it can use. It has the Railroad Labor Board, it has the Inter-State Commerce Commission, and it has the power to order priority of shipment, rationing of materials, and the prosecution of those who interfere by conspiracy or otherwise with the operation of its orders.

In providing for the emergency in coal, the Government, without delay and without further waiting for acquiescence on the part of either party to the dispute, should establish a non-partisan, not a bi-partisan, tribunal to examine the immediate situation and provide such scales of wages and such regulations as will serve for temporary purposes.

But for permanent relief there is need of a coal commission such as The Outlook has repeatedly advocated. This should be established by law and empowered to get all the facts relating to the coal industry that are ascertainable and to propose a plan for the conduct of the industry that will be adapted to its peculiar factors both human and material, and will enable and encourage co-operation between management and men. As long as industry is organized in such a way as to throw labor and management into hostile groups, so long will there be the constant peril of industrial war. It is essential that from such a basic industry as that which supplies the people with fuel the peril of war should be removed. Therefore in the coal industry it is important that or-

ganization should be such as to insure constant consultation between those who provide the labor and those who provide the capital and the direction of the industry. This is the essential principle of the shop committee. For any permanent settlement of the problem of coal production without recourse to destructive strikes such a coal commission must provide for some way by which agreement shall be reached between men and managers on the basis of understanding rather than force.

AN EDITOR AND HIS PROFESSION

ONE of the most important figures in American journalism passed when Charles Ransom Miller, Editor-in-Chief of the New York "Times" for forty years, died on July 18. The editorial page of the "Times" under his guardianship has been a credit to the profession to which he devoted his life. One does not need to be in sympathy with the views expressed in that page to recognize that it represented a steadfast, philosophic point of view; that it treated the affairs of the Nation with conscientious dignity even when it lacked the brilliancy of utterance of the older American tradition. It was not the editorial page of a Dana, but it was better suited to the needs of the present than the more personal editorial methods which flourished a generation or so ago.

The qualifications which bring leadership to a modern newspaper were never better expressed than by Mr. Miller in a statement to a committee of the Senate in 1915:

Every newspaper that enjoys continuity of existence and management has a certain body of principles. They are called the policy of the paper. Those are the principles and beliefs that guide its expressions and opinions. The men who express those opinions are the editorial writers. . . . They are men. They wear neither halos nor horns. They form their opinions just as other men form their opinions, by observation and reflection and information. . . . But each paper has a body of principles that guide its utterances, and the men who write those principles believe them. Nobody in the "Times" office is ever asked to write what he does not believe.

The true test of the work of writers who practice their profession under such a tradition is to be found in another statement made by Mr. Miller before that same committee:

We appear before the jury every day. We appear before the grand inquisition, one of the largest courts in history; we are judged at the breakfast table. We feel that if we

were improperly influenced by anybody outside of the office there is none so quick to discover that as the readers of the paper.

To grant freely that the editorial page of the "Times" under Mr. Miller was guided by the principles which he enunciated is not to say that it was not influenced by prejudices which revealed themselves in blindness to certain social developments and to the real news value of certain facts. By the pseudo-radical, sure of his own infallibility, these evidences of blindness were taken as proof of a capitalistic conspiracy to suppress the truth. The "New Republic" once devoted a large part of an issue to an endeavor to show that the "Times" willfully misrepresented news from Bolsh-

evist Russia. It certainly showed that there were important inaccuracies in the news reports of the "Times," and perhaps a willingness to believe the worst of a Government which has since exceeded the utmost limits of past condemnations. Such omissions and interpretations make just grounds for no charge of conspiracy. At the most they are merely corroborative evidence that the editors of the "Times" "wear neither halos nor horns," and that "they form their opinions just as other men form their opinions, by observation and reflection and information."

Within the acknowledged limitations which Mr. Miller defined, and these limitations will always exist, the modern newspaper, of which the "Times" is per-

haps the pre-eminent American example, plays an increasingly important part in our National life. As the world has narrowed, so the field of journalism has expanded. The eyes of the journalist are on the far corners of the earth. They must see beyond men and immediate events and take cognizance of those currents of history which are molding the world of to-morrow. In so far as they can gauge those currents, measure their velocities, search out their origins, they can do much to turn them into channels that lead to the growth and not the retrogression of civilization.

Mr. Miller was a man aware of his responsibilities, and he bore them with little thought of personal reputation or reward.

THE LEGION AND THE DISABLED VETERAN

THERE are certain psychological tests in which the victim is placed in a chair and the examiner proceeds to roll off a series of single-worded questions. The victim is supposed promptly to fire back the first word that comes into his mind. It works something like this:

- Q. Goldfish?
- A. Salmon.
- Q. Stew?
- A. Slum.
- Q. Front?
- A. Hoboken.
- Q. Work?
- A. Paper.
- Q. Kitchen?
- A. Police.

"Aha!" says the examiner; "you were a soldier during the World War. Probably in the Quartermaster's Corps. But you didn't get overseas. Am I right?"

The victim acknowledges the truth of the charge and departs abashed at the omniscience of the examiner.

All of which is a roundabout introduction to the statement that if the American public were confronted with such a questionnaire, occurred the word, Legion? at least ninety per cent of that public would roar out the word, "Bonus!" Whether the public favored or opposed that bonus, the answer would be the same. In the public mind the Legion is identified almost wholly with the Bonus Bill. The Bonus Bill likewise means, in the public mind, large cash payments to able-bodied veterans. That the Bonus Bill is not better understood and that the Legion should be identified only with a garbled version of that bill is a matter to be regretted profoundly.

Back of the agitation for the real Bonus Bill lies a feeling among the veterans that the American people have forgotten them, and the basis for this feeling is to be found very largely in the neglect and mistreatment of our disabled soldiers.

Public opinion to the contrary, the Legion has devoted the greatest part of its effort, not to the bonus, but to the protection and care of these disabled men. Whether or not the Legion has been remiss in its failure to make this clearly understood is a subject which is not now under discussion.

The story of the Legion's fight for the disabled men has been told in recent numbers of the "American Legion Weekly" by Mr. Marquis James, a writer whom we know to be a careful and responsible correspondent. We shall endeavor to summarize some of the chief points in his articles as they have been running through the months of June and July.

THE LEGION'S FIGHT

In 1919 the Legion began its fight for adequate care of the disabled veterans. It found that the public had accepted promises from the Government as a substitute for the fulfillment of those promises. The problem of caring for the disabled veterans Mr. James succinctly puts in the following words:

In the rehabilitation of a disabled man there are three things to be done. He must have physical, financial, and industrial assistance. He must be placed in a hospital and given treatment until his health has been restored or improved as far as lies within the power of medical science. When physically able, he must begin his training for re-entry into self-supporting life. Usually this means the selection and mastery of a new calling which will be possible under the handicap of infirmity. During all this time and until he is vocationally rehabilitated he must receive financial aid to compensate for loss or diminution of earning power. In case of permanent disability, affecting earning power through life, this financial aid, or compensation, must be perpetual.

At the time when the Legion started its campaign there were three separate

agencies attempting to solve the problem. Says Mr. James:

Medical care was in the hands of the United States Public Health Service. Utterly unprepared, without adequate hospitals, facilities, or personnel, and no clear way by which to get them, it failed deplorably, and out of this failure grew up the vicious contract hospital system, the practice of farming out these precious wards of the Government to private, municipal, county, and State hospitals and institutions. The industrial end of the question fell to the Federal Board for Vocational Education, which was created for the purpose at the beginning of the war and which had months to prepare for its task before any of the wounded came home. Millions were appropriated for the use of the Board. It was this Federal Board which promised most and accomplished least of any of the three agencies. Here, with the least excuse, the failure was greatest. The Bureau of War Risk Insurance, another war-time creation, was charged with the compensation of all disabled not actually in training under the Board. The Board compensated the men in training.

THE VETERANS BUREAU ORGANIZED

At the end of a campaign which lasted for two years these three agencies were united in the Veterans Bureau as a result of the passage of the Sweet Bill, for which the late Commander Galbraith labored long and hard. On the face of it the Legion had received all that it had asked for, but, as often happens in Governmental affairs, a law on the books is not always a law in the hand. The new Bureau was assigned to Mr. Charles R. Forbes, its present head. Mr. James says:

The situation that Mr. Forbes took over was still shockingly bad in nearly all departments. Knowing this, the Legion did not expect instantaneous results. Mr. Forbes was assured of this. He was promised complete co-operation. The Legion pledged him every aid and undertook

to withhold public criticism and to suspend judgment until he had been given a thorough opportunity to demonstrate his ability to untangle the skein.

In fulfillment of this promise the Legion has placed a liaison officer in each of the fourteen regional districts into which the Bureau has divided the country and has kept the mechanism of its entire organization at the disposal of the Bureau. Mr. James says positively that the Legion supports the Veterans Bureau and its present administration. This fact, however, does not keep him from frank and constructive criticism of its activities:

Ten months have passed since Mr. Forbes took the reins. What the Legion has done in this time has been done without comment, except such as would tend to reassure the veterans and the public and avert too hasty judgment. Most of what the public and the veterans have been permitted to read of the Bureau has emanated from the Bureau's publicity office in Washington. It is to be regretted that these utterances have frequently been misleading. We have read repeatedly of the staggering sums the Government is spending on the disabled. Just now it is spending money at the rate of \$528,600,000 a year, and the President's signature to the new Langley Bill increases this total to \$545,600,000, or as much as it cost to run the whole United States Government twenty-five years ago. We hear that 30,000 men are in hospitals, that 109,000 are taking vocational training. The inference is that all is lovely.

This inference is false. It is not a question of how much is spent, but how wisely it is spent. Thirty thousand men in hospitals means little unless we know they are in fit hospitals and that there are no others not in hospitals who should be there. And we know the contrary of this to be true. One hundred and nine thousand men in vocational training is significant only if these men are getting training which will enable them to come back to your town and mine and earn a living. Such is not the case. So much for figures as instruments of propaganda.

Between the half-billion dollars which the Government is spending annually for the disabled veteran intervenes what Mr. James calls the "old familiar bucket brigade—the silhouettes of Incompetence, Jealousy, Mismanagement, Greed, Waste, Extravagance, and Shortsightedness." Politics has interested itself in the thousands of appointments to be made within the Bureau. People and communities have fought for and against the location of hospitals on grounds which had nothing to do with expected benefits for the disabled.

The Legion, as the United States should be, is dissatisfied with such a situation. Perhaps the most striking failure of the Government's agencies for the care of disabled soldiers is to be found in the lack of hospital facilities. The Surgeon-General of the Public Health Service in 1919 accurately fore-

told the number of beds needed for the care of our ex-soldiers. It was not until 1921 that Congress appropriated over \$18,000,000 to commence an adequate programme of construction. Fifteen months have passed, and the Veterans Bureau has available but one-seventh of the number of beds which the programme calls for at the present time. All these beds are in remodeled structures or additions to previously existing institutions.

WHERE THE BLAME LIES

The failure of this programme Mr. James lays to the office of the supervising architect in the Treasury and to Brigadier-General Charles E. Sawyer. The story of the interference with this programme is too long to be given here. It should be said, however, that the White Committee, charged with the selection of the sites for the new hospitals is exonerated by Mr. James from any share in the delay.

Apparently the delays caused by the supervising architect's office were delays of the ordinary bureaucratic variety. General Sawyer, chief co-ordinator of the Federal Board of Hospitalization, does not escape so easily. Mr. James quotes a letter from A. A. Sprague, Chairman of the Legion's National Rehabilitation Committee, which was written to Mr. Dawes, the former Director of the Budget. Mr. Sprague wrote:

I know of no one thing that has so constantly and consistently tended to upset and unsettle the general hospital situation as have the suggestions, attempted rulings, and changes of the chief co-ordinator. I feel very strongly that the ill-considered use of figures, and statements that are not capable of proof, in regard to adequate facilities and proper care of disabled ex-service men will do incalculable harm, at first to mislead the public and later when they have been disproved, as they must be by the Legion, if no one else, it will shake confidence in the Administration and the integrity of its assertions that it is doing everything in its power to give proper facilities, treatment, and care.

More than \$18,000,000 was made available for hospital construction by the recently passed Langley Bill. The Legion sees no hope of having this money promptly and efficiently spent unless the Director of the Veterans Bureau be permitted to use it without interference from the powers which hampered previous progress. Although the law specifically places responsibility upon the Veterans Bureau, there are signs that its provisions are being subverted.

The tragedy of men whose minds have been destroyed or unsettled in the war, the tragedy of tuberculous veterans housed in inadequate hospitals, the tragedy of wounded soldiers farmed out to contract hospitals—one of the great States of the Union has been discovered making a large profit from the sick soldiers intrusted to its care—is more vivid, perhaps, but hardly less injurious to the Nation than the tragedy of the

men whom the Government has promised to retrain for civilian life. These men number more than 100,000, and the estimate of the failure of the Government to fulfill its promises to these men runs from a minimum of twenty-five per cent to a maximum of seventy-five per cent. The Director of the Veterans Bureau himself estimates that the percentage of failures is at least thirty per cent. Mr. James says:

The principal factors responsible for this state of affairs are these: Men misplaced; . . . men who have been so improperly cared for that their interest has become dissipated; drones, "gold-brickers," and incorrigible students; incompetent and dishonest schools; the manifold deficiencies of "placement training;" the general failure of the administrative mechanism of the training project to function, with particular reference to the selection of vocational objectives and the supervision of men in training.

None of these shortcomings originated with the Veterans Bureau, though some have continued under it without abatement until very lately. But on the whole the Bureau has tackled these evils with energy and some effect. The Bureau inherited a shockingly bad condition. The old Federal Board for Vocational Education was supremely incapable. Its first policy was to make training as difficult to get as possible. Smoked out of that position by the Legion, it went to the other extreme and made training too easy to get. Thousands of men were pitched into training when they had no business there. Schools unfit, courses all wrong, vocational advice and supervision a joke—what did it matter? The cry was get the men in training and stop the criticism.

There was also another motive, and a worthy one. The Federal Board became decentralized and able to reach the men in their home communities before the War Risk Bureau did. Board agents found hundreds of men helplessly disabled and in pitiful need because the War Risk Bureau had not got around to them with compensation. The Board made a practice of placing such men in training—or, at any rate, on the training pay-roll—simply as a humanitarian measure of financial relief. In this manner the Board probably saved men's lives, even if it did further complicate the training question.

What the misplacing of men may mean is graphically illustrated by a story which Mr. James tells of a boy of Italian extraction in Massachusetts who was forced to peg shoes with a machine-gunned arm for a year when all the time he wanted to grow flowers. He escaped from training to a greenhouse, and a few months later won a sweepstakes ribbon for his chrysanthemums at the National Flower Show.

THE TRAGEDY OF THE MISPLACED

Of the present situation Mr. James, speaking for the "American Legion Weekly," says:

Mr. Forbes is doing some fore-

sighted things in the realm of vocational training. Mistakes have been made, but bad conditions are being corrected probably about as fast as is humanly possible, considering circumstances. The scandalous hospital situation of course has first call. But Mr. Forbes brings about, tolerates, or has thrust upon him some things which are not so easily understood. At a recent conference held in Washington to consider means of improving certain phases of vocational training a resolution was adopted and widely published. It begins:

"The work of the Veterans Bureau (with reference to vocational train-

ing) is being conducted with gratifying success."

The "Weekly" believes it is being "conducted toward success." But there is a long road to travel.

Mr. James's articles present as careful and as full a summary of the situation of the disabled veteran as we have seen anywhere. The Legion has the facts and the means of following developments which are possessed by no other organization. If these facts are properly presented to the Nation, the time will come when the reaction of public opinion to the test word:

"Legion?"

will be an instantaneous cry of: "Justice for the disabled!"

It will certainly be a fairer reaction than the present cry of "Bonus!" The Legion must give to the public constant and reiterated information concerning the status of our war-crippled men. It will find that the public has not forgotten its wounded soldiers; but it has been ignorant of the state in which they have been living. The widest publicity will be a powerful support to the Legion in its furtherance of a campaign deserving of the utmost success.

GERMAN DEMOCRACY IN DANGER

EDITORIAL CORRESPONDENCE FROM EUROPE

BY ELBERT FRANCIS BALDWIN

RECENT events in Germany mark the difference between an inveterately traditional form of government and a new and untried form.

Old ideas—political, economic, social—are being upset. Hence one cannot expect to find a republican Germany without monarchic reaction. Indeed, after a residence in Germany some sturdy republicans from other countries despair of ever seeing there any republic on sure foundations.

These critics point, first, to the ineradicable German instinct towards dependence on and passive obedience to some higher, by-God's-grace, power in the state, instead of on a state made by and representing themselves, the real rulers.

Second, in a land where force, as expressing law and order, is the language still most easily understood the army, these critics note, has always meant, not popular, but royal or imperial, rule.

Third, apart from the Socialists, so slight was the pre-war republican movement in Germany as to seem almost non-existent; practically all the powerful political forces have been monarchist.

To most Germans, therefore, a republican form of government seems unnatural—as it were, a very unnecessary copying of the Swiss and French governmental forms. To hold this opinion is to take a sober, mature, firm stand. But the old-line Teutons become angered and infuriated when they learn of any courteous, especially of any docile or submissive, word from the new German Government towards those of the Entente Powers in carrying out the terms of the Versailles Treaty. It would be bad enough if these words came from princes and aristocrats. But to have them come from the middle and lower middle classes—and in the name of the whole German realm!—this is too much for princes and aristocrats.

They have been impelled to counter-strokes. We saw the short-lived Kapp-Lüttwitz *coup d'état*. It only strength-

ened the Republic. Then, to gain time, instead of another frontal attack, the monarchists and militarists fell back on the temporary measure of individual attack. The Erzberger murder last August was an example of this.

But the idea of a possibly necessary wholesale massacre has not been absent from the extremist mind. Reactionary newspapers have been hinting at a new Saint Bartholomew's. Towards this recent events have tended. In them all has been increasingly evident the monarchist accent—in the teaching by left-over staffs at schools and universities; in army reviews, regimental feasts, celebrations of battle anniversaries; in Ludendorff's statement that Germany needed a dictator, a man on horseback; in the Prussian pilgrimage to the ex-Empress's tomb; in the Bavarian demonstration, led by ex-Premier Kahr, crying "Vivat Rupertus Rex!" finally, the day before Foreign Minister Rathenau's murder (the signal for a reactionary rising), in ex-Vice-Chancellor Helfferich's violent Reichstag speech. "A Government like ours," said Helfferich, "having abandoned to the enemy important parts of German sovereignty, ought to be summoned before a High Court of Justice. The continuation of our [Rathenau's] present foreign policy is leading to a catastrophe. We must show the enemy that there are still *men* in Germany. . . . Only the monarchy can again give to Germany the sentiment of her dignity and the consciousness of her possible force."

The old Junkerdom was thus raising its reactionary head against the new democracy.

Then came the Rathenau assassination, revealing anew the power of monarchist organizations, like the "Consul," for instance: a detachment of it had been, it is said, specially charged with the suppression of certain political personalities. It planned Erzberger's assassination, it is claimed, and is generally credited with the attempt to murder

Scheidemann. Created at Munich, it has extended itself all over Germany. Following the Rathenau murder, under the guise of a meeting of protest against the Versailles Treaty, a mobilization of forces was to have been attempted.

But the reactionaries, blinded by political passion, did not foresee the real effect of the Rathenau crime upon the people and the Government.

The people gathered by the thousand in Munich and Berlin. They condemned as masqueraders those who professed allegiance to law and order while they were supporting a policy of assassination. In Berlin the meetings were the more impressive, not only because the city is by far the largest in Germany (Greater Berlin actually containing more than 4,000,000 people), but also because it is the center of German political activity. The meetings, with their banners and cries of "Hang Helfferich," left no doubt that, whatever the provinces might think, the center of German life is republican in sentiment.

As to the Government, Chancellor Wirth at once proclaimed in Parliament: "*Es geht nicht weiter.*" or, as we might say, "This thing has got to stop." Here is the rejoinder of Dr. Wirth and his colleagues: By laws pressed through Parliament (already approved by the Council of the Realm), the Government plan to—

(1) Impose the death penalty on all members of secret societies concerned in planning the assassination of a Government official;

(2) Impose penal servitude on those who know of the existence of such societies and who do not inform the authorities, or who assist such societies, or who insult either a Government official, the Government flag, or the Constitution;

(3) Expel from Germany any person guilty of any offense should he be a member of a former reigning family;

(4) Establish a special tribunal to deal with revolutionary crimes;

(5) Invest the Government with special power over newspapers which encourage revolutionary agitation.

So much for legislation. As to administration, the promptness of the police in tracing the Rathenau assassins is silencing the Socialistic critics on the Government side who have been claiming that monarchist and militarist fugitives from justice can always count on police protection. The revelations now made of the connection between the Rathenau assassins and the monarchist organizations are not only compromising for the reactionaries but are proportionately strengthening the Republic.

All German monarchists are not militarists. All German monarchists are not reactionaries. Many monarchists are sincere upholders of law and order. Some of them even admire a republican form of government. But they are convinced that Germany is not yet ready for it, and perhaps never will be.

These particular monarchists, unfortunately, lack powerful leaders at present. The monarchist leaders who have the upper hand are those who have, in general, lost the world's confidence. Their present policy and methods only emphasize the world's judgment.

Keystone

GERMANS PARADING IN BERLIN CARRYING A PLACARD WHICH CALLS FOR IMMEDIATE IMPRISONMENT FOR LUDENDORFF, HELFFERICH, AND ESCHERICH

Such a method as political assassination has not killed the Republic. The murder of the Republic's Foreign Minister was indeed a body blow. It showed

that democratic Germany was in danger; but it awakened her energies. She is marching on.

Terriet, Switzerland, July 6, 1922.

FURTHER MARTIAL ADVENTURES OF HENRY AND ME

SPECIAL CORRESPONDENCE BY H. J. HASKELL, OF
THE KANSAS CITY "STAR"

THE Martial Adventures of Henry and Me" on the battle-front in France, which William Allen White described so entertainingly four years ago, is to have another chapter. In this one the old comrades of Armageddon, of the Red Cross, and of a score of hard-fought political fights appear no longer as allies, but as antagonists. To-day William Allen White is under bond awaiting trial on a charge ordered made by his old friend, Henry J. Allen, Governor of Kansas.

The clash came over the method of enforcement of the Kansas Industrial Court Law, which was enacted at the instance of Governor Allen, with the hearty support of Mr. White. Briefly, Mr. White believed the Governor was violating the fundamental right of free speech in enforcing the law. Governor Allen insisted that the question was not one of free speech, but of conspiracy to nullify the law. It was a conflict that grew rather naturally out of the editor's concern with fundamental principles of democracy and the executive's preoccupation with the duty of law enforcement.

The Industrial Court Act grew out of the coal strike of 1919. Under the leadership of Governor Allen, William Allen White ardently co-operating, the Kansas Legislature undertook to do away with strikes in essential indus-

tries. It provided an Industrial Court to pass on disputes in such industries, and made the strike unlawful. It not only provided for the punishment of strike leaders, but it guaranteed protection to all workers and prohibited strikers from using violence, intimidation, threats, or persuasion in order to deter men who wish to work in an industry from so doing. In short, it prohibited picketing.

When the strike of the railway shopmen began, the State issued warrants for about fifty of the leaders in the State and then devoted itself to protecting the men who were employed to replace the strikers in the shops. Various forms of picketing were tried and broken up by the State Government. Then the leaders in the shop centers visited hotels, restaurants, and grocery stores and induced the owners—frequently under compulsion—to refuse accommodations to any of the strike-breakers. The State interpreted this as picketing and forced its discontinuance. The leaders finally resorted to placards saying: "We are for the striking railway men 100 per cent. We are for a living wage and fair living conditions." These were put up in the windows of restaurants and stores. The Attorney-General held that they were simply another form of picketing, intended to break down the efforts of the railways

to maintain an essential industry, and Governor Allen ordered them removed.

Numerous placards had been put in store windows at Emporia, the home of William Allen White. When they were ordered out, he felt that the State's action was a blow at a right that was essential to democratic government. So he sent out for a placard and put it up in the office of his newspaper, the Emporia "Gazette."

He struck out the figures "100" and wrote in "50," explaining that he was 50 per cent for the strikers; he felt their demands were just, but he was opposed to the strike as the means of winning them. Then he gave out a statement in which he said: "The right of free utterance of honest opinions is a fundamental right. . . . To restrict any man from the calm expression of an honest opinion merely because there is a strike in Kansas is unwise. Industrial questions are not honestly settled by a suppression of free utterance, either by speech or by the press, . . . so long as the opinion is orderly and temperate and decent."

To this Governor Allen replied that free speech or liberty of the press was not involved. Mr. White, he said, was free to discuss the strike in his paper from any angle. But he held that the law was violated when the Emporia editor joined with the strike leaders "in an organized effort to build up in all shop

(C) Paul Thompson

HENRY

centers against those who were at work an atmosphere of hostility by hanging in the windows of the stores a card prepared by the strike leaders declaring that store was in favor of the strike and the strikers. This movement is interpreted to be a well-organized conspiracy for the purpose of aiding the strikers to stop transportation. It was their effort to line up the entire community in an expression which would increase the hostility toward the men who are at work and make more difficult the opera-

tion of the railway industry that constitutes the offense against the Industrial Court Act."

In other words, Mr. White was concerned with general principles; Governor Allen, with a definite situation considered in connection with what had gone before. Mr. White felt it was unwise to administer the law in such a way as to seem to suppress a fundamental American right. Governor Allen believed it was not free speech, but disguised coercion.

After a vain endeavor to persuade Mr. White to accept the State's interpretation of the law Governor Allen reluctantly ordered a complaint to be sworn out against his old friend. It charged him with entering into a conspiracy to picket the employees of the Santa Fé Railroad shops at Emporia and thus impede transportation, an essential industry. The case will be heard in the district court at Emporia in October. Meanwhile Mr. White has taken down his offending sign and has appealed to the strikers to discontinue the use of the placards until after the court decision. In his statement he says that he has always criticized corporations that persisted in defying the State's interpretation of the law while the matter was pending in court. At the same time he expresses his admiration for Governor Allen. "In administering the law as he sees it," Mr. White says, "he has been brave and patriotic. The 'Gazette' does not agree with him in the action which seems to suppress the fundamental right of free speech." In a statement Governor Allen outlines the differences between them, but adds: "The friendship

Paul Thompson

AND ME

of all these years cannot be broken by the differences in our opinion as to what constitutes a violation of the law."

There can be no question of the honesty and sincerity of both men, or of the essential identity of their aims. It is unfortunate that such an issue should have been permitted to develop to obscure the great experiment now being undertaken in Kansas to determine whether industrial warfare can be superseded by adjudication in court.

Kansas City, Missouri, July 23, 1922.

WILLIAM ALLEN WHITE STATES HIS OWN CASE

TO Mr. Haskell's clear summary of the Kansas situation which has resulted in the arrest of William Allen White we append two telegrams.

One is from Ernest H. Abbott, Secretary of the Outlook Company to Mr. White. The other is Mr. White's reply.

New York, July 24, 1922.

William Allen White,
Emporia, Kansas.

Are the men you sympathize with getting higher or lower than the average Kansas wage? Is Kansas law unjust or discriminatory? In our opinion, America has been sought by foreign workers because of better working and living conditions here. Do you agree in general, and is your antagonism to the present laws a protest against National or Kansas conditions? We recognize the occasional necessity of increasing wages, although the cost of living is thereby increased. Does such a necessity exist in Kansas at present? Have you a plan to solve railroad and coal strikes? Can you telegraph reply at our expense to reach us Tuesday morning, our press day?

ERNEST H. ABBOTT,
The Outlook.

Emporia, Kansas, July 24-25, 1922.

Ernest Abbott,
Care of Outlook,
381 Fourth Ave., New York, N. Y.

Your questions are all beside the point. I have no expert knowledge, and but passing interest in railroad wages in Kansas or elsewhere. I was arrested for exposing a poster on the "Gazette" bulletin board. The poster declared, "We are for the striking railroad men fifty per cent. We are for a living wage and fair working conditions." This was modified from a poster issued by the Strikers' Committee, declaring, "We are for the striking railroad men one hundred per cent." I did not go one hundred per cent because I honestly believe that the strikers have a good cause but a bad strike. But the Governor and the Attorney-General, however, felt that my poster was incendiary, and I felt that I should defy their order to take it down, in order to test the question whether or not in a State wherein no martial law has been declared, where not a gun has been fired, and wherein there has been no bloodshed, the utterance of any opinion about a strike temperately made and issued in an orderly manner is not a citizen's right. That is all there

is to my arrest. It is a question for the courts to decide. It has nothing to do with wages or with the Industrial Court Law. I am indicted with two men I never saw and never heard of, two strikers, and we are charged with a conspiracy to stop the Santa Fé trains. It's too much for me to understand if that is good law. And this is not an ex-parte statement, but the whole truth so far as my own connection with the case. The State Administration holds that this placard is picketing, and it is with violating the anti-picketing law that I am charged. You may make any use that you please to make of this information above.

Truly,
W. A. WHITE.

Mr. White is a good friend of ours, as he is of thousands of others. Our telegram was a friendly inquiry which, in spite of Mr. White's statement, we still think was pertinent. He says he is fifty per cent for the strikers. We wanted to know about that fifty per cent. He says that the strikers have a good cause, but a bad strike. We wanted to know why he thought their cause good. We wish he had told us.—THE EDITORS.

IRISH PORTRAITS

SPECIAL CORRESPONDENCE FROM IRELAND

BY NIALL RONAN

FOR the first time in many centuries there have been genuine rebels in Ireland. That is to say, a body of persons have revolted against the freely expressed will of the Irish people and against their own legally constituted Government. "Easter Week Repeats Itself," said a placard of the insurgents in Dublin on the day the Four Courts were retaken. Like many another propagandist assertion, that was untrue. The rising of Easter week, 1916, whatever may be thought of its wisdom, was the protest of a band of young idealists against a foreign domination, and one which they firmly believed was determined to embark on the hopeless enterprise of trying to convert a nation of natural soldiers into unwilling conscripts by force of arms.

CHILDERS RUNS THE GAMUT

In 1916 Erskine Childers, one of the chief insurgents to-day, was fighting in the British army. We do not call him a rebel now, nor then, as he is an Englishman. His cousin, Captain Robert Barton, was in charge of the Sinn Fein prisoners after the Easter rising, being then an Imperial officer. Soon afterwards he resigned his commission and was imprisoned for making a seditious speech. He escaped from Mountjoy Prison, Dublin, it is said, in the following fashion: A lady friend visited him. Concealed under her own clothing she smuggled to him his complete uniform as an officer in the crown forces. When she had gone, he changed into these garments and walked out through the main gate of the prison, and was saluted as he went by the guard. All this was done of course by bribing some prison official. Last week Mr. Barton was again arrested in the residence of Mr. Childers, on the outskirts of Dublin. A friend who lives a few doors from the place told me that the National troops tried to get in, but at first thought that the house was empty. They surrounded it, and found Mr. Barton hiding in the back garden, the frightened-looking little son of Mr. Childers peering out from a top window meantime. The prisoner was marched to an armored car at the end of the road. Mrs. Childers must have known of the arrest, as she can seldom leave the house, owing to lameness. She is an American, and before her marriage was Miss Mollie Osgood, of Boston.

Mr. Childers fought with the British also in the Boer War, when he was a trooper in the City Imperial Volunteers. He is the author of "The Riddle of the Sands," the story of a Secret Service agent in the North Sea, and of a treatise called "The Framework of Home Rule," which advocates a very restricted form of self-government. He is now inciting

the people of Ireland to fight against a treaty and Constitution which give them virtual independence. In the Great War Mr. Childers was a flying officer and did some brilliant work in photographing the German defenses at Zeebrugge from the air. During the Black and Tan régime a raid was made on Mr. Childers's house, and he publicly protested because a young subaltern in the British forces smoked in Mrs. Childers's presence (the wife of an officer of superior rank) without her permission. His full title is Major Erskine Childers, D.S.C., but for obvious reasons he now prefers the plain prefix of Mr.

DOLE FROM THE ENEMY

For several years the unemployed in Ireland, as in Britain, have been receiving a Government dole weekly. The Provisional Government have continued this. Despite the difficulties of distributing it during the trouble last week, they were very anxious that it should not be stopped, lest any excuse should be given for looting. One of the district offices was therefore opened—not more than twenty-five yards from Moran's Hotel, an Irregular stronghold, now destroyed. After several hundred men had quietly entered, undismayed by the rifle fire from the National and rebel forces outside, and signed for and received their money, seven Republicans came calmly across from the hotel, showed that they were entitled to payment, were paid, and returned to their duties as enemy soldiers of the Government whose money lay in their pockets!

AFTER O'CONNOR DIDN'T DIE

Rory O'Connor, the Republican commander of the Four Courts during the siege and since Good Friday, when he occupied it, is the son of a Dublin solicitor. He had a distinguished career in the Royal University of Ireland and obtained a degree in engineering. But when his course was over he was found to be tuberculous, and was told that he had only three months to live. As he had been offered a position on a Canadian railway, he thought that he might just as well live his three months with a salary as without one, so he left to take up work in that Dominion. He didn't die, and when the European War came he returned to Ireland to join up. He tried to obtain a commission, but failed, owing to the state of his lungs. In 1916 he fought with the Sinn Feiners and was wounded. Some time afterwards he started a bomb factory outside Dublin, which was discovered. He is a grave, taciturn man of thirty-six or thirty-seven years, with a deep voice and a determined way with him. He is not married, and his political activities are far from tasteful to his father, and brothers. Just after he first entered the

Four Courts with his garrison one of his brothers was asked by a friend what he thought of Rory's latest achievement. "Well," was the reply, "I never did take much stock in bishops, but I must say that I agree with them that little boys should not be allowed to go to the 'movies' alone!" Rory had an entertaining way of interviewing the press while he played with an automatic on his desk. Entertaining for him, I mean, of course.

MADAME DE MARCKIEVICZ'S EMOTIONS

The women members of the last Dail were nearly all the relatives of men who had suffered during the 1916-21 struggle in Ireland. Madame de Marckievicz was the one exception. She married a Pole, an artist, she herself being a member of the well-known west of Ireland "settler" family—the Gore-Booths. Prior to the Larkin strikes of 1913 she had been a familiar figure in Bohemian circles in Dublin, very charming, very irresponsible, and intellectually very woolly. Within five minutes I have heard her express her earnest belief in peasant proprietorship and a co-operative commonwealth for Ireland, little recking that there was anything inconsistent in the two economic theories. When it was pointed out to her that the two things could not logically exist at the same time and in the same place, she retorted, airily, that it "would all work out in practice." She was in command in one area in Dublin during Easter week, 1916. She says herself that she shot two policemen dead. Her brother, Sir Josslyn Gore-Booth, whose place at Lissadell, County Sligo, has lately been occupied by Regular troops, had the matter investigated and proved, to his own satisfaction at least, that she did nothing of the kind. And, as a friend of hers remarked to me: "I don't believe she did it intentionally, at any rate; because Connie Marckievicz could never hit anything she was aiming at." In short, she is sincere, but far too liable to be swayed by her emotions, and would give her last crust or her only pair of shoes to any beggar who needed them. She was sentenced to death after the 1916 affair, but this was commuted to penal servitude for life, and she was released under the amnesty in 1917.

"THAT MAUDE GONNE," SEZ SHE

Madam Gonne MacBride is a rebel of a different type. She is the gaunt remains of a once famous beauty. Her father was Colonel Gonne, of the British service, but, although English, she has been anti-English all her life. As far back as 1900, when Queen Victoria visited Dublin for the last time, Maude Gonne, as she then was, appeared on an Irish jaunting-car dressed in black, waving a black flag, in the streets thronged with people ready to welcome her whom

Maude had called "the Famine Queen." In his "Queen's After-Dinner Speech at the Vice-Regal Lodge" the late Percy French, the Irish Grossmith and comic poet, alluding to this incident makes the Queen say:

"An' that other wan," sez she,
 "That Maude Gonne," sez she,
 "Dressing in black," sez she,
 "For to welcome me back," sez she
 ("As if I care," sez she,
 "What they wear," sez she).
 "Now Maude will write," sez she,
 "That I brought the blight," sez she,
 "Or althered the saisons," sez she,
 "For some privit raisons," sez she.

In the late eighties Maude's beauty took Paris by storm, and when "Major" MacBride returned there, covered with the notoriety that he had gained in leading the Irish brigade against the British in the South African War, she married him, and they came back to Ireland as soon as the British Government would permit him to do so. Their life was not happy, and later she divorced him. He was executed after the rising of 1916, and their son, Sean MacBride, was taken prisoner at the Four Courts when the garrison surrendered. Madam MacBride approved of the Treaty, but she has apparently joined the Republicans now, probably out of sympathy for her son. Of late years she has done much good work in organizing free meals for the poor and in connection with the Irish White Cross.

TEMPERING WAR WITH WIT

Ireland is full of tragedy now, but the comic incidents of its daily life would fill several books. Chalked on one of the lorries engaged in trying to get the youthful garrison at the Gresham Hotel to surrender were the words: "Why

waste bombs? Try monkey nuts." Formerly the native wasted wit on a soldiery that did not understand the Irish sense of humor, but now the repartee bandied between the troops and the civilians would well pay a recorder of it. An agitated lady rushed up to a lorry-load of National soldiers: "And have you all come through that dreadful firing unscathed?" asked she. "Ah! begorra we have, ma'am," said one of the lads, as he jumped off the car. "Sure God's good, and he made their sight bad!"

A SHOW, WITH INCONVENIENCES

In one of the Dublin streets Irregular snipers were exchanging shots with Regulars in windows some twenty feet above the street level. A crowd of interested citizens remained below. Finally, four National soldiers came into the thoroughfare and knelt down to shoot, thereby drawing the fire of the snipers to the pathway. Slightly alarmed, one mother tried to drag her five-year-old daughter out of range. The child, however, was loth to miss the fun and pulled at her hand. Meantime two little newsboys stood behind the soldiers, waiting to pick up the empty cartridge cases. This to demonstrate that, while the outside world is humming with news of our war, we are more interested in it than frightened by its attendant risks. We go on much as usual. A woman of my acquaintance bought bacon on Saturday from a very mild-looking storekeeper. On Sunday she was astonished to see the same man being marched off among a lot of captured Irregulars. He evidently kept his business and the war in water-tight compartments.

A Southern Irish newspaper is in the hands of the Irregulars. Its news, as

usual, comes over its private wire from England and abroad. All this is censored by the Republican occupiers of the office. Anything which, by some lucky chance, gets through from Dublin is first censored by the Provisional Government. So there it is "between the devil and the deep sea." In Donegal the rebels were mobilizing in a stronghold on a height—once a castle with a moat. In another place in the same county is an island joined to the mainland by one bridge, over which runs the only railway connecting the district with the outer world. The insurgents announced their intention to destroy this bridge, if necessary, and hold the island. The inhabitants of the countryside viewed this prospect with anything but joy. "And," said one native, "the worst of it is that the fellows who are going to do all this are Cork men."

THE DUSK OF THE FALSE GODS

It is a wonderful country. Few have been better loved, for it pulls at the heartstrings of some of the least emotional of its sons and daughters. If, out of the welter of blood and the destruction of treasure of all kinds, peace should come at last, a place can be found here for all who wish to serve it. Full many Irishmen have done their share in building other states. Surely they can use their genius now in rebuilding their own. They have the advantage of a new and democratic Constitution and, better still, their race mind is cultured by centuries of tradition. But they must learn to distinguish the substance from the shadow; they must be strong enough and stern enough to put aside false gods and mistaken ideals. I believe they are already doing so.

Dublin, July 10, 1922.

UNCLE SAM AND HIS NORTHERN NEIGHBOR

SPECIAL CORRESPONDENCE FROM CANADA

BY P. W. WILSON

IN the evolution of the British Empire, now so rapidly proceeding, history will record no event fuller of meaning for the future than the conferences between the President of the United States, Secretary Hughes, and Mr. Mackenzie King, the Prime Minister of Canada. For a month I have been touring through Ontario, interviewing, among others, both Mr. King and the Premier of the province, Mr. Drury; and I may sum up the situation by saying that the Dominion of Canada, with a population of nine million, can no longer afford to be "off the map." She is not now a country that can be, as it were, taken for granted. Even if her feelings be ignored, her trade is substantial and, on the whole, increasing apace, which trade is to-day the chief factor in her foreign politics. Comparing Canada with Australia, we find that Australia

has but one simple international aim—to remain at once white and at peace with Japan. All that Australia has to do is to encourage settlers from the mother country and to send merchants through the open doors of India and China. With England it is not politics that the Australians play, but the more vital game of cricket.

But Canada is not an island, like Australia. Indeed, hers is the longest undivided land frontier in the world. Throughout that frontier there arise problems every day; not vague, grandiose, and remote, as are the projects of ambition or imperialism, but problems which affect the humdrum daily doings of ordinary and peaceful citizens. Four-fifths of the routine business transacted at Washington through the British Embassy is Canadian business. The arbiters who recently valued the Grand

Trunk Railway included William H. Taft. The further deepening of the St. Lawrence River would provide both the Dominion and the Republic with additional water power and facilities for transit. When the United States repudiates the treaty which opens the ports of both nations to the fishermen of both nations in Atlantic waters, the Maritime Provinces of Canada are deeply stirred. And wider issues are involved when scores of Japanese fishermen in Pacific waters are arrested by the authorities of the Dominion. The Rush-Bagot Agreement, which limits fortifications on the border and the use of warships on the Great Lakes, means more to Canada with every day that passes. Overloaded with war debt, the Dominion has still to balance her budget. For armaments, whether on land or sea, she has neither use nor money. Her controversies with

the British Admiralty over a navy are all solved by having no navy at all. Her army, reduced to thirty-five hundred men, is merely a side-show of civilian administration, and the officers trained in the military college at Kingston immediately enter civil life. All of which is understandable enough as long as the border represents no more than a line of distinction between separate but harmonious sovereignties. But is that the only significance of the Canadian frontier? What about the tariff, with its inevitable accompaniment of smuggling? What about prohibition, with its inevitable accompaniment of bootlegging? And, above all, what about immigration? In the admission or exclusion of aliens it is obvious that the policy pursued in any one country of North America will help to determine the resultant population throughout the entire continent.

I am writing in a small-town hotel the restaurant of which is decorated with twenty-nine Union Jacks. On July 12 fifty thousand Orangemen paraded through Toronto, and other tens of thousands through other districts, all swearing the sincerest loyalty to Great Britain. Every post office flies the British flag. Every coin displays a royal countenance. Every store advertises the perennial charm of Princess Patricia of Connaught. Every audience sings "God Save Our King." Even in Quebec the French-Canadians think that they have excellent reasons for avoiding absorption by the United States. Between Irish and French Catholicism there is, to begin with, a very human rivalry. And the British North America Act, which is the Constitution of Canada, guarantees to the people of Quebec their language and their separate schools, neither of which would be allowed in such unrestricted measure under the Stars and Stripes. If, then, Mr. Mackenzie King or his Finance Minister, Mr. Fielding, proceeds to Washington, it is not to discuss changes of sovereignty. No one on either side of the line wants any such question to be raised.

What confronts Canada is the inescapable fact that Great Britain knows nothing, and cannot be expected to know anything, about the North American affairs above enumerated. Good government must be, after all, government on the spot. Canada has no Ambassador at Washington. The British Ambassador is responsible, not to the Canadian Government as such, but to the British Foreign Office. At this moment, which happens to be a critical moment in Canadian politics, Sir Auckland Geddes is significantly absent in London. The Prime Minister of the Dominion therefore steps in, asserts once more a separate treaty-making power, and makes it quite clear to Secretary Hughes that he can negotiate with Canada direct, as with any other nation, irrespective of her imperial connection with Great Britain. The British Empire is, and ever has been, held together by anomalies. One more anomaly will be

henceforth the diplomatic relations established by short circuit between Washington and Ottawa.

To this situation Great Britain herself has contributed. If her Empire was conquered "in a fit of absence of mind," it cannot be held together unless presence of mind be at least attempted. I am not one who thinks that the system of Imperial preference, proposed by Joseph Chamberlain, would have added anything to the solidity of Greater Britain. But Joseph Chamberlain was right in rebuking an attitude in England of mere inattention to the needs of the Dominions. On one subject Canadians are deeply incensed, and with good reason. It is a subject that closely concerns the farmers, on whose good will the Dominion Government depends for office. Not only does the United Kingdom exclude Canadian cattle, but the reason for such exclusion adds insult to injury by declaring that the cattle are diseased. A Commission has found a verdict that there is no disease in Canadian cattle as alleged, yet the exclusion continues. It is not too much to say that here is a grievance as substantial as some at least of the grievances alleged by the American colonies in the eighteenth century; yet the subject is still under controversy in the mother country. In justice to the United Kingdom, it should be added that in all imports save cattle Canada enjoys there a free, though of course a competitive, market.

What has added to the perplexities of Canada is the American tariff, as proposed, and all that it represents. At the very moment when Britain excludes her cattle the United States—with a bark that may prove to be worse than the bite—talks about a virtual exclusion, not of cattle alone, but of everything else. Canada is a small population up against a big one. She feels as sore over the American tariff as Serbia used to feel when Austria-Hungary raised duties against her pigs or as Ireland felt when Britain thus treated her manufactures. To some extent it is Canada's own fault. Ten years ago her greatest statesman, Sir Wilfrid Laurier, proposed reciprocity with the United States and would have established this proposal had not Canada driven him into retirement by the slogan, "No truck nor trade with the Yankee." Even to-day the Conservative party, led by Mr. Meighen, now in Opposition, looks askance at more intimate trade relations which would tend to consolidate North America. But none the less the United States tariff, if applied in all the rigor suggested by some and abandoned by others in Congress, would be a blow to Canada delivered clean between the eyes.

For the Dominion absence of mind at Washington is thus a more serious matter than absence of mind in London. The one is an irritating inconvenience; but the other may result in an economic calamity. Against such a high tariff Canada must take measures. One of

these measures would be a retaliatory tariff, most repugnant to Mackenzie King as a Free-Trader and to the Progressives, with many Liberals, on whose support he depends. Another counter-stroke would be an adoption of virtual free trade with Great Britain and other British Dominions. To this one cannot imagine Mackenzie King raising any objection on fiscal grounds—quite the contrary; but politically his objective is not any such Imperial federation. His philosophy does not dwell on the word empire. What he wants is, rather, peace and, above all, peace in North America. If any choice had to be made in the future between the British connection and friendly relations between Canada and the United States, Mackenzie King would be among those who stress the vital importance to the Dominion of the latter. Hence his urgent desire to avoid a tariff war.

For one must realize that the future of trade is also deeply exercising the mind of Britain herself. Commerce with Germany, Russia, and Europe generally is still in large measure paralyzed. The able-bodied unemployed in Britain still number more than two million. To promote the emigration of this surplus a sum of \$75,000,000 has been set aside by Parliament. And there is to be in London a British Empire Exhibition, the object of which is to promote inter-Imperial trade. This means that once more Britain is seeking to call in the New World to balance the deficiencies of the Old. She is turning from the Europe which refuses to be "saved" and she is turning to continents beyond Europe which are still unexhausted. For Canada this attitude on the part of Britain affords an alternative, possibly, to the nearer market of the United States. But statesmen of the school of Mackenzie King would not regard the alternative as adequate. They wish to avoid even the appearance of a commercial rivalry within North America. But for this very reason the proposals of Britain might well afford Mr. Meighen, as a Conservative, a line on which to attack the present Canadian Government. It cannot be pretended that, as matters stand, the United States is popular to-day in any part of Canada. Her growing financial influence over the manufactures of the Dominion is watched with undisguised vigilance, and one of the greatest objections to developing the St. Lawrence arises from the fear lest the United States might thereby acquire control of a waterway which Canadians consider to be in a peculiar sense the glory of their country. If the fiscal policy of the United States makes impossible the reciprocal commerce desired by the Canadian Prime Minister, we must expect, then, a considerable spell of patriotic agitation north of the border and the possibility of the revulsion of sentiment which proved too much for Laurier, whose mantle has descended on his political pupil and successor at Ottawa.

THE MODERN LUMBERJACK

BY ROBERT H. MOULTON

THE twentieth-century lumberjack is pretty much the same kind of man that he was thirty or forty years ago, when logging was at its zenith. He is the same stalwart, powerful, masterful man of the woods as of old. There is this difference, however: he lives and works under infinitely better conditions than the old-timers. Thirty years ago the logging camps were built of logs—buildings which were not much better than barns. To-day there are some log camps built, but most of them are frame buildings sealed with tar paper. They are comfortable in summer and winter.

In the model camps of Michigan the buildings are lighted with electric light, there are bathrooms, and every man has a comfortable bed in which to sleep. It did not take any muck-raking to make the lumbermen give their employees beds in which to sleep instead of bunks filled with pine boughs or hay. In fact, the lumbermen had to fight to make their men sleep in comfortable beds. A few years ago the lumbermen applied efficiency methods to the science of lumbering, and they saw that their best men would not slow up if their bodies got the best possible rest and relaxation at night. Stiff muscles have no place in a Michigan lumber camp. The men are also furnished with books and current magazines; their meals are prepared by cooks who know their business, and there is always an abundance of good, wholesome food, of a sufficient variety to tempt even the discriminating appetite of the city dweller.

The jacks of Michigan are picked men. They form without a doubt the most efficient body of workers, man for man, to be found in the country, for no man gets a chance to become a woodsman

DERRICK USED FOR LOADING LOGS ON CARS

unless he has proved in the hardest possible school his ability to get sixty minutes of unrelenting toil into an hour, to stand untiringly great extremes of temperature, to master the science of "falling" trees so they will not damage other trees, block roads, crush bark, or shoot down mountain-sides. He must have good health, be able to live at peace with forty or more other huskies, and be able and willing to find his place in the woods on dark winter mornings when the thermometer is down to 30° below zero.

The man who bears the proud but ugly name of "hick" looks with scorn upon the clumsy foreign laborers who follow him in the woods and cut out the small "paper" wood left after the

"hicks" have carefully disposed of the hemlock, birch, maple, beech, and poplar trees. The woods "Hunky" has been "surveyed." The "hick" does not need a survey, because he gets the pay he demands, does the work expected of him, gets the best of food and all he can eat of it, wears high-priced woollens the year round, wears shoes which never cost less than \$10 a pair, and can get a job in any lumber camp in the United States for the asking.

The lumber camp is a busy and interesting place three times a day. Summer and winter the men are called at five in the morning. At 5:30 they have breakfast—a bumping meal prepared by the chief cook and assistants. At six the men start for their places in the woods, working like mad until the dinner gong sounds at 11:30. For dinner they get an elaborate meal, the lumberjacks then eating great quantities of meat. They are at work again at 12:30, quitting at 5:30.

The average camp is composed of forty men, no more men being taken in than the beds will accommodate. The supper is the most social meal of the day for the lumberjacks. During the afternoon the cooks usually prepare a bushel or more of doughnuts for the jacks. These disappear at this meal. After supper the lumberjacks have a jolly time telling stories of the chase, of the "high spots" they have hit when spending "road stakes," of movies they have seen in the cities, of fights they have waged, and of thrilling experiences they have undergone in their work. A lumber camp is no place for a troublesome man or for a man who is not on the square.

The jacks are great smokers, and they do not use tobacco which has had the bite removed by a patented process. The

HAULING A LOAD OF WHITE PINE LOGS ON A SLED

lumbermen get their supplies at the company store, practically at cost. Many of the lumberjacks read, for they are intelligent men from among whom the future jobbers and bosses must come. Cards are not played, for the bosses want as little fighting as possible. The dining-room is hallowed ground in a lumber camp, no jack being allowed to pass the threshold of the dining-room door until the cook gives the word. The large common room in front of the dining-room is the winter club of the men. This they occupy until nine o'clock, when they go to bed.

While cutting methods have changed in the woods in the past thirty or forty years, it is interesting to note that two of the oldest of hand tools, the wedge and the ax, are still leading devices in the lumberman's art. It is true that the cross-cut saw has taken over some of the duties of the ax, but nevertheless the latter tool is quite as necessary as it ever was. There are two methods of felling trees: with the ax alone, or with the ax and cross-cut saw. Power-driven machines for felling trees have been invented, but, while these are more or less successful in the actual cutting of trees, the trouble lies in transporting them to the spot where the work is to be done, which is often in the midst of heavy underbrush or for a long distance over uneven ground, making it difficult, if not impossible, of access for a power-driven device. On the other hand, the ax and cross-cut saw can go wherever the men go.

There is no more interesting operation in the woods than the felling of a tree by expert lumberjacks. If the tree is to be felled with the cross-cut saw, the first step is to cut a notch with the ax on that side of the tree looking in the direction in which it is desired to have it fall. This notch is wedge-shaped, the under surface being horizontal and the upper at an angle of forty-five degrees to the former. This notch serves two pur-

SPLITTING A BIG FIR LOG

poses: it directs the fall of the tree and also prevents bad splitting of the bole.

After the notch has been made the cutting with the saw is started on the opposite side of the tree and a few inches higher than the horizontal surface of the notch. As soon as the saw has buried itself in the tree the wedges come into use. They are driven into the cut, back of the saw, thus preventing the weight of the tree from falling on the saw, and also helping to direct the fall. Usually the tree begins to fall just before the cut from the saw has met the notch on the opposite side and while a part of the bole is still intact. When this point is reached, the jacks who are doing the felling are on the alert, since it is necessary for them to stay long enough to make certain that the tree will fall, and at the same time allow themselves a few seconds in which to make their getaway with the saw.

The hemlock cutters go in pairs. A

team is composed of a "spudder" and a "fitter," the latter notching the tree to be felled. When the tree is felled, the spudder peels the bark from the stump, while the fitter with his ax "rings" the tree, cutting clean grooves around the trunk every three feet or so in order that the spudder may peel off the bark with his spud—an instrument something like a Cuban *machete*. When the fitter gets toward the top of the tree, he trims off the branches and "smashes" the knots with the blunter side of his ax, so that the spudder may get the bark off easily. After the tree has been stripped, the two men cut it into 16-foot logs.

After the peeling comes the road cutting through the forest, and the teamsters, who are highly skilled men, "grab-drive" the logs out of the woods to the skidways, where two expert skidders, waiting on the specially built lumber railways, load the logs on the cars. The jacks take their hand at building railways through the forests as well as cutting roads for the teamsters. "Swampers" clear the roads and the way to the logs as they lie in the woods. The teamsters are judged by their skill in manipulating their teams over the rocky roads and in keeping their horses in good condition while working at top speed. Unskilled teamsters would kill a pair of horses in three months. Skilled men can keep their horses in good condition for years.

The Michigan woodsmen work practically all the year round. Few of the lumberjacks are married, but they usually marry when they become bosses. They are generous to a fault, and "blow" themselves when they get the *Wanderlust*. They flit from camp to camp, willy-nilly. They may be in Michigan to-day, and on the way to Wisconsin, Mississippi, Minnesota, or West Virginia to-morrow. They take particular pride in showing the mountaineers of Virginia, North Carolina, and Tennessee how to work—and how to fight.

STABLES OF A LUMBER OR LOGGING CAMP IN WINTER

THE GOD IN THE MACHINE

BY ELSIE SINGMASTER

MR. SPANGLER waited beside his huge motor omnibus in the Plympton Square. He was a short, heavily built man with a stubby beard and twinkling blue eyes. He wore two old sweaters and an old brown overcoat and wasted all the warmth they might have given him by pushing them back in order to thrust his hands deep into the pockets of his trousers. The November air was raw and the sky a uniform gray—winter, Mr. Spangler believed, would set in to-night. He did not mind winter after it had started, but the first days were like a plunge into a cold swimming-hole.

The omnibus looked as queer as Spangler himself. It had been built by an amateur over the body of a truck, and, as the driver's seat was very low and the other seats arranged in rising tiers, it had somewhat the look of an inclosed stairway. To-day it had an especially odd appearance on account of a washing-machine which was roped to the rear, its legs standing straight out. Sometimes the omnibus was thickly plastered with crates and boxes, so that it seemed to be a moving warehouse.

Spangler stamped his feet and beat his arms against his breast. He would leave Plympton at four, and reach Summit Hill at six. There he would hand over his passengers to the trolley car which ran down the other side of the mountain, taking in exchange the passengers which it had brought, and would be back in Plympton by eight. To-day it would be dark at five.

He looked at all the persons who came toward him, hoping for a passenger—not for the sake of personal gain, since he had a stated salary, but for the sake of companionship on the long ride. He liked both to talk and to listen. He liked also to have pleasant adventures to tell Mrs. Spangler about when he got home.

At 3:55 he blew his horn violently in order to summon from the hotel any traveling men who wished to go with him. No one, however, answered, and he climbed aboard, started his engine, and waited. He heard the court-house clock strike four, but still he lingered and blew his horn again. When no one appeared, he drove slowly across the square and toward the west. Near the edge of the town his hope was gratified. He saw waiting for him, bag in hand, the passenger whom he preferred above all others. This was his young pastor, Mr. Filene, whose increasingly frequent visits to the other side of the mountain made Spangler think that he was interested in some young lady. He stopped the car and opened the door, and Mr. Filene stepped in.

"It's getting colder," said he.

"There'll be snow on the mountain,"

prophesied Spangler. "I put chains on, and they laughed at me in the garage, but I haven't traveled this mountain ten years for nothing."

"People seem to be staying at home."

"Yes. I did their errands for them."

I bought a half-dozen spools of thread for Mrs. Graybill and I have a washing-machine for Mrs. Hedge. It won't suit Mrs. Hedge. I'll be exchanging it to-morrow. I told the man in the store. I said: 'Now don't look black at me when I bring this machine back. If you don't want to see it come back, then don't let it go out.' These are the things I've brought out and exchanged in the last six weeks: one rake, one shepherd pup, one lawn-mower, one shoat, ten packages from the dry-goods store, eight pair of shoes, and one ironing-board on a stand. Mind you, these things I not only brought out, but took back. My wife she kept account."

"Why do the stores send her things?"

"She has a hold on 'em in some way. She's the richest woman round here. She has three fine farms and three large apple orchards."

"I think you're very patient to carry all these things."

"I am that," agreed Mr. Spangler.

"My wife says I'm a regular Job. Mrs. Hedge had two husbands, and it's my belief she hounded both into their graves. She has a daughter, too; a nice woman, and she pretends that she didn't like the man the daughter married and she won't have anything to do with her. The truth was she didn't want to lose her daughter's services. You'll see her, she'll come out. Now I don't mind fetching anything for Mrs. Graybill. She's a lady. Her boy was killed in the war. He was married at a camp in York State, and his wife ain't never come to see her. Mrs. Graybill sews from morning till night; she has a hard time making strap and buckle meet. I don't know why either. She ought to have enough to live on, but it seems she don't."

The car had passed the last of the scattered houses at the edge of Plympton and was out on the smooth pike. Mr. Spangler quickened his speed. Night was falling rapidly and in a few moments they could see only the road and a narrow strip on each side which was illuminated by the lamps.

"Where do these ladies live?" asked the young preacher.

"They live close together about five miles out, just a little this side of Worleysburg. Mrs. Hedge lives in the finest house on the pike, the one with the tower—you must have noticed it many times—and Mrs. Graybill a little beyond up the hill in a tiny little gray house where the big silver maple is. You must have noticed that too."

"Yes," said the young preacher. "I remember that tree."

"I couldn't tell you in a year how mean Mrs. Hedge is," said Mr. Spangler, solemnly. "She could get blood from a stone. I watch her like a hawk, and every now and then she cheats me out of a few cents. She chooses a time when I'm in a great hurry with a car full of passengers, and she says, 'Spangler,' she says, 'I owe you seventy-four cents, and I have only seventy-three.' Now no one would make a fuss over one cent. Couple o' times I bought something for her which was two for a quarter. If I pay thirteen cents, she'll only give me twelve. I'm often ashamed of her before the passengers. We're passing the first of her orchards now, and the finest. Thirty thousand dollars was what she got last year for the crop—not barreled, mind you, and ready to ship, but on the trees."

"What does she do with her money?"

"Salts it down."

"Who will get it?"

"Land knows!"

"You know everybody along the road," said the preacher, encouragingly.

"Yes, sir. Now over there where that light is live the Clymer girls. They are what you call crowd-shy. They never go out. They are like rabbits when you go near them. They are getting very old. If you go there, they don't open the door for a long time, then they look out as though you had come to murder them."

"What will become of them?"

"Oh, what becomes of all of us?" said Spangler, philosophically. "Sometimes I'll look over and it'll be all dark, then I'll go in. Once they closed their shutters at sunset, so I went over and told 'em I couldn't guide my machine. Now they don't shut 'em till I'm past, so I know every day that they're still living."

The road dipped down into a hollow. At the bottom Spangler stopped the car.

"You might think she'd come with a lantern," said he as he stepped down.

From the darkness a shrill voice called, "Is that you, Spangler?"

"Yes, ma'am."

The voice came nearer. "Did you get my machine?"

"Yes, ma'am."

"Ten to one they didn't give you the right kind." The voice was now at hand.

"Yes, ma'am."

The omnibus heaved and shook as Spangler toiled at the ropes which fastened the washing-machine. The snow had begun to fall; the preacher saw the lazy flakes drift down into the shaft of light from the lamps. He saw also the face of Mrs. Hedge, long, swarthy, with gleaming black eyes. She

had a black shawl wrapped closely round her head and she looked not unlike a very savage monk glaring out from his cowl. She was evidently inquisitive as well as mean. Having stared at the preacher, whose polite bow she ignored, she walked along the side of the car. She was slightly deaf and she spoke shrilly.

"Only one passenger, Spangler?"

"Yes, ma'am."

"The trip won't pay you very well, will it? Carry the machine to the back porch, not the front porch."

The preacher got down and assisted with the machine. He was about half the size of Mrs. Hedge. She followed, giving directions about avoiding the gate, and when Spangler had put the machine on the porch she accompanied him back to the road.

"What did you fetch for Mrs. Graybill?" she inquired. "A needle this time, or perhaps it was a pin?"

Spangler was busy gathering up the rope which had fallen to the ground, and she repeated her question. But he did not answer.

"What did you say?" she shrieked as he got into the car.

The car started with a roar.

"You're leaving rather unceremoniously," said Mr. Filene.

"Oh, I ain't through with her," Spangler said, carelessly. "I'll have another chance to bid her a sweet good-night. Now she couldn't give me a lift with the machine, but she'll take it into the kitchen all by herself for fear I'd let a little cold in. What do you think of such a woman, Pastor?"

"What do you think of her?"

"I think she can't help herself. She is as she is. The Lord made her that way. Now up here's Mrs. Graybill; the Lord made her good-looking and kind-hearted. She's a noble woman. She's out with her old lantern, so as not to keep me waiting a minute."

But Spangler insisted upon waiting. He got down and took a basket from under the seat.

"Here's the thread," he said. "And here's the cloth and the pattern for the little boy's suit. Mrs. Graybill, this is my minister."

Mrs. Graybill reached her hand up to the omnibus. The preacher saw a soft, worn face with beautiful brown eyes.

"I'm glad to meet you." She weighed the basket in her hand. "Mr. Spangler, you speak the truth, but not the whole truth. There's something here besides thread and cloth and patterns."

"I have nothing to do with that," said Mr. Spangler as though he had been caught in some mischief. "I give it to you as Mrs. Spangler gave it to me. Good-night."

"Good-night," answered Mrs. Graybill. "You stop to-morrow evening for the little boy's suit."

In Worleysburg there were neither passengers nor commissions. Beyond the first slope of the mountain caused the old car to pant and groan. Here

the ground was white. Mr. Spangler gave himself to somewhat gloomy speculation; he contrasted the worldly estate of Mrs. Hedge with the worldly estate of Mrs. Graybill. Mrs. Hedge, he said, had everything and deserved nothing; Mrs. Graybill had nothing and deserved everything.

"Mrs. Hedge has a daughter and don't care for her; Mrs. Graybill had a son who was the light of her eyes, and he was taken away. Mrs. Hedge has thousands of dollars and don't use 'em or enjoy 'em. If Mrs. Graybill had money, she'd do good with it from morning till night."

"We can't understand," said Mr. Filene. "Which do you think is the happier?"

"Mrs. Graybill," answered Spangler, positively. "Even with all her troubles she's happier. But I can't understand why she has to work so hard."

The snow thickened both in the air and on the ground as the car climbed higher and higher. When they got up among the pine woods, Spangler pointed out the tracks of deer which must have crossed the road just before them. The lights of the car gleamed uncannily on the glassy eyes of an owl sitting on a low branch. They came at the end of an hour's hard running to Summit Hill and stopped by the side of a little platform. They could hear the trolley car lumbering through the woods and see its bright headlight. With regret Spangler saw his passenger step down. He hoped for at least one for the return journey.

Again his hope was gratified, but in the single moment when the newcomer stood illuminated by the glare of his headlights he looked at her askance. She wore high-heeled slippers and a very short skirt and a fur coat which seemed to Spangler to be made from the skin of a leopard, and she had a large hat on which a bunch of feathers rose and fell like a fountain. She spoke with an accent strange to Spangler, who had never heard the peculiar *patois* of New York.

"Say, do you go to Plympton?"

"Yes, ma'am."

"Do you pass Mrs. Graybill's?"

"Yes, ma'am," answered Spangler, stammering a little in his surprise and confusion. "Did you want to go there?"

"That's where I want to go. And I hope it's not such a God-forsaken spot as most I've seen to-day."

Spangler forgot even his customary "Yes, ma'am." A dreadful possibility came into his mind. He saw a sweet old face, a gray head bent eternally over unending sewing. He walked across the platform to exchange a few words with the crew of the car.

"A gay bird," said the conductor. "Mrs. Graybill's her name. Has a mother-in-law in your direction. Going to get some money out of her."

"Oh, my!" said Spangler, aghast.

"You needn't be afraid of her," said the conductor. "She has a gentleman friend in New York."

"I'm not afraid of her," said Spangler.

He stepped into the car and sat down by the young lady. Still he saw Mrs. Graybill, Senior, working by her little lamp. He saw her look up when he tooted his horn and wave her hand out into the darkness. He looked sidewise at his companion. Young Graybill had been a decent fellow—how had he happened to choose such a wife?

All Spangler's mental questions were answered by young Mrs. Graybill. She had no reserves. It did not occur to her that it was unwise to talk to a stranger, or that a stranger might not be interested in her affairs. First, however, she commented upon the landscape. She looked out at the white road and the dark, mysterious pines, already bending with a load of snow, and she shivered.

"I never knew there were such places. I've been traveling since morning, and I've seen nothing but woods and fields and a few hick towns. How far is it to Mrs. Graybill's?"

"Fifteen miles."

"You ought to make that pretty quick. I have a friend who drives a taxi. He'd make it in twenty minutes."

"Yes, ma'am," said Spangler. He was thankful that poor Mrs. Graybill, Senior, was to have more than twenty minutes' grace.

"Will I have to travel in this ark when I leave?" the young woman asked.

"Yes, ma'am."

The young woman crossed one knee over the other and Spangler saw her thin slippers and silk stockings which were just the color of the lightest shade in her barbaric coat.

"Mrs. Graybill's son was my husband," she explained. "And from his talk I gathered that it must be a very fine place where he lived. If that's so, I ought to have some benefit of it. He didn't will me his insurance outright; it goes into a fund and I get the interest unless I marry—then his mother gets it. I got almost nothing from the Government. I never saw anything like this Government for pure meanness. I wrote to his mother that I simply couldn't live, and she's like the Government; she sends me twenty dollars a month—about as good as nothing. So I thought I'd come to see how things were. She writes fine letters, but talk's cheap."

Spangler could hardly believe his ears.

"Does Mrs. Graybill send you twenty dollars a month?" he asked.

"Twenty dollars a month," said the young woman. "Fine income, isn't it?"

Spangler was more confused and distressed than ever. Twenty dollars a month without working for it seemed a great deal. It must seem a great deal to Mrs. Graybill. No wonder she sewed all day!

"She was going to make it only ten."

"Yes, ma'am," said Spangler. He drove slowly, to postpone a little Mrs. Graybill's evil hour.

"Do you know how much property she

has?" asked the young woman when the car had begun to glide down the steep hill.

"No, ma'am," answered Spangler.

"Does she live well?"

Spangler did not know whether to say yes or no. A faint uncertain "Yes, ma'am," came out involuntarily while he was debating. "Did you think of living with her?" he asked.

"No, siree," answered the young woman, emphatically. "The city for me and the first train back. What time do you pass to-morrow morning?"

"About 7:30."

The young woman groaned, then she laughed.

"Well, I guess that won't be too early. I'm sure I'll never sleep in this lonely spot."

Spangler passed slowly through Worleysburg. He rather prided himself on his ability to untangle human problems, but there was no way out of this. A half-mile ahead stood the little house of Mrs. Graybill; unless he stopped here by the wayside for the night he must go on and introduce to her this dreadful young woman. It would break her heart.

"Did you know John Graybill long?" he asked.

"No," laughed the young woman. "About two weeks. He fell in love with me at first sight. It was that way with lots of soldiers."

"Did you work before you were married?"

"Of course I did! I was a clerk and a cloak model. I could be one again any time."

Spangler felt that this statement offered somehow a vague clue to his problem, but he was too stupid and confused to follow it out, and, besides, he had too little time. He could see already the tiny gleam of Mrs. Graybill's lamp, and he gathered speed so as to make the hill on the top of which stood her little house. He surmounted the hill, and saw her fine profile between him and her lamp; he saw her lifted hand, and in an instant he was abreast of the house. Then, suddenly, he was still more confused by the sight of a moving lantern below him and a little distance ahead.

"Here you are," he said, miserably, but as he spoke he unintentionally let the car glide past Mrs. Graybill's house and down the hill. The lantern before him described a wide and angry arc; only Mrs. Hedge ever halted him so imperiously. He reached toward the door, not seeing that young Mrs. Graybill prepared to step out. But before he opened it the voice of Mrs. Hedge came in. She thrust her face toward him out of the darkness. In the wavering light of her lantern it had a baleful glare. Her voice had a hissing sound.

"Spangler, you take that wash-machine back," she screamed. "It ain't put together right. It'll leak. Take it back to-night."

Spangler pushed the door open a little

wider in order that he might tell Mrs. Hedge that carrying the machine out and roping it to his car was a work for daylight, not for darkness. As he did so he felt a clutch upon his arm. It was a clutch of terror. The young woman seemed to be appalled by the mere sight of Mrs. Hedge.

"Don't stop," she whispered, hurriedly. "Oh, please don't stop!"

"You do as I say!" screamed Mrs. Hedge. "You were a fool to bring such a thing." Mrs. Hedge seemed about to thrust her long face through the glass of the half-open door. "To-night, Spangler. At once!"

"I don't want to get out, do you hear me?" whispered the young woman, still more frantically. "I wouldn't stay for a minute. Oh, don't tell her it's me!"

This paroxysm of fright was incomprehensible to Spangler. He wondered whether the young woman was losing her mind.

"To-morrow," he shouted to Mrs. Hedge.

"I won't pay a penny charge for carriage!" called Mrs. Hedge above the sound of the starting engine. "Not a penny! Not a penny!"

"All right," he answered. "All right."

He was turning his steering wheel—he must of course go back to Mrs. Graybill's. But the young woman still clutched his arm.

"I don't want to see her!" she cried again. "I don't want anything to do with her!"

At last Spangler understood.

"But, you see," he began, honestly, "that wasn't—"

"I don't need to see her," she cried.

"I have a friend who wants to marry me. Let her have the insurance. I don't want anything to do with her."

For a long moment Spangler was silent.

"Is your friend able to support you?" he asked at last with a leaping heart.

"I should say he was! He has a fine position. He wanted me to get married this long time. I don't care if the Government does stop the compensation or if I lose the insurance. I don't want anything to do with her."

"Will the Government send her the insurance if you get married?" asked Spangler.

"Of course," said the young woman, ruefully. "They'll notify her quick enough. He must have been like her in nature or he wouldn't have fixed things that way."

Spangler had still not started the car. It seemed dreadful that Mrs. Graybill's daughter-in-law should identify her with Mrs. Hedge, but the alternative of Mrs. Graybill knowing her daughter-in-law was worse.

"You have no children?"

"No, indeed," said Mrs. Graybill, emphatically.

Spangler started the car slowly. Once or twice he turned and looked at his companion. He could not see how any one, even a young soldier about to leave

his native land to face enemy bullets, could think her attractive. Perhaps poor John had repented—at least the boy had thought of his mother. While he was meditating Spangler saw the lights of Plympton. The young woman saw them too.

"You take me to a hotel," she directed. "Unless there's some way out to-night. I didn't leave any word for my friend. I don't know what he'll think of me."

"There's no train," said Spangler. "But"—he hesitated. He was tired both mentally and physically and he saw Mrs. Spangler's hot supper waiting. The children were kept up to have a half-hour's play, and if he were late he would not see them until to-morrow.

But Spangler believed that Providence had appointed him to save Mrs. Graybill, Senior, and that his work was not yet over. He saw her daughter-in-law in the Plympton Hotel, telling her story to the clerk, the chambermaid, to any one who would listen. It would not take her long to learn the truth.

"I can take you on to Maytown," he offered. "It's only twelve miles. You can get a sleeper there at ten, and be back in New York in the morning."

"All right," said Mrs. Graybill. "He won't ever know I was away. You see, he was in love with me before I knew John. I'll bless you forever."

At Plympton Spangler went into the hotel to send a message to Mrs. Spangler. He promised her with vague hints a great treat. He said to himself with pride that one could safely tell Mrs. Spangler anything. When he came out, his passenger had one slipped foot out of the car.

"If it's only twelve miles and the train doesn't leave till ten, I'll have something to eat," she said. "I'm starved."

Spangler shook his head. He had the thoughtful and solemn air of an officer of the law sustained in his somewhat ungrateful task by an obligation to righteousness. His weak misgivings were negligible beside his conviction that he would not only be saving Mrs. Graybill, Senior, from heartbreak and releasing her from her incessant work, but in a sense giving her back her boy.

"I have to be back," he said, firmly. "Anybody else'll charge you double." He stepped into the car and laid a parcel on young Mrs. Graybill's lap and closed the door. He was a smart man when he had time to think. "There are some sandwiches for you," he said. "There's a restaurant in Maytown, where you can eat right."

"Thank you," said Mrs. Graybill, quickly opening the parcel. "It was crazy of me to come," she confessed with relief. "I couldn't make up my mind to give up my independence, especially if I could live a little better. But now I know my own mind. I don't think any young woman like me ought to live alone. His name is Jack Le Roy. That's a prettier name than Graybill."

"Yes, ma'am," assented Spangler, politely. He put on all the speed of which

the bus was capable, as though to equal that of the swiftly running Jack. So terrific was the roar that conversation was impossible until he slackened his pace as he approached Maytown.

"I'll send you an announcement," promised Mrs. Graybill, as she stepped down.

Spangler came out of a brown study. Alongside of a bright, attentive face

under the supper-table lamp he had been looking at another face, bent, by a smaller lamp, over eternal sewing.

"So do," he said, heartily. "I'll be glad to see it."

THE SEA AND ITS PREY

BY HELEN H. HOFFMAN

IN the early days of peace numerous companies were formed in England for the purpose, as their officers and stockholders then believed feasible, of floating and rescuing the great ships, like the Lusitania and others of valuable cargo, that went to the bottom of the sea under enemy fire.

Many of these companies represented large capital, and certainly they abounded in optimistic expectation of large profit to be gleaned from the proposed operations.

To-day the stockholders who cherished such rosy hopes in their investments are wiser than they were about the ways of the sea, and are quite content to confine their speculations hereafter to land affairs, with which they are more familiar.

Company after company organized for this purpose of raising "dead ships" has given up, and the vast sum of money spent on experiment in new inventions, machinery that did not work, and divers who proved beyond doubt that human existence even in twenty fathoms of water with a sixty-pound pressure to the square inch was a waste of time, is as much a loss as the ships at the bottom of the sea.

One jolly British seafaring man who merely laughed at these puny efforts of the many to do an impossible task is Commodore Sir Frederick Young, who was Chief of the Salvage Section of the British Admiralty during the war. After a record of having salvaged more than four hundred merchant ships and having saved the British Government a sum in the neighborhood of \$250,000,000 by this achievement, he is retiring from his war labors.

He only recently completed the last bit of work in connection with the clearing of the Zeebrugge and Ostend harbors, where the sunken British cruisers blocked the enemy way to the sea.

Commodore Young, who has had forty years of experience in rescuing stricken ships, is too wise in the ways of the sea to attempt the impracticable in any of his war-time or post-war salvage work.

To attempt to raise the Lusitania would be, in his opinion, a great waste of time and money.

"I do not say it would be a physical impossibility," this salvage expert pointed out, "but the cost of such an undertaking would far exceed the value of the ship and whatever may be left of its cargo or valuables.

COMMODORE SIR FREDERICK YOUNG, CHIEF OF SALVAGE SECTION, BRITISH ADMIRALTY, DURING THE WAR

Sir Frederick was instrumental in saving over four hundred merchant ships

"From a business standpoint, the salvaging of ships that lie in great depths of water is an impossible proposition. Men who know this business thoroughly would never resort to such attempts."

Then there is another point to consider in this fascinating rainbow adventure into the undersea life. Scores of people, scenting a quick fortune to be made in such salvage work since the war, have occupied themselves with all sorts of experiments made "on their own." Only recently an Englishwoman fitted out a sailing vessel, and, with some sort of paraphernalia by which she hoped to conduct salvage work around the English coast, sailed forth into the promised land of adventure. So far her efforts at accomplishing her purpose have been confined to a sort of joy ride at sea—nothing more.

In fact, she would have to do a good piece of work to make something above the expenses of the trip, for there are laws that apply to the life of the sea, particularly to its disasters, that must be taken into consideration. One may not pick up valuables which the sea has given up and retain them, any more than one may shoplift with impunity at a department store. For example, parts of lost cargo washed ashore may not be retained by the finder. He must turn

such stuff found into one of the receiver's offices, which are maintained at many ports along the British coast. After a certain time, fixed by law, the matter is adjusted, and the finder or salvager is allowed about thirty per cent of the value of the find. In the case of lost ships, the vessels and their cargoes continue to be the property of the owners, no matter how long they remain in the water. And, as has been proved by the efforts of many since the war, smuggling ships into harbor is not so easy as it seems on paper. The all-important fact, as many have learned, is that first one must land the ships. Appropriating even a sunken vessel is, under the law, termed piracy, and heavy punishment is attached. One or two instances of this happened during post-war salvage work. A tugboat captain, enterprising and alert to the opportunity of earning some salvage money, noticed a vessel beached at low tide. It was one the salvage corps had been working on for some time and was just about to raise, when the tugboat captain ran alongside one night and towed her into port. When the men came to work the next morning and found the ship gone, they sent out an alarm to the Coast Guard and made inquiries at the various ports, and when they discovered what had happened were about ready to prosecute the tugboat captain. However, a compromise was made, and the captain proved to their satisfaction that he had no intention of willfully nabbing the vessel. He merely thought, he said, the sea had, through some extraordinary current running, given up the ship, and he considered it his duty to get it ashore. Acts of proved piracy are punishable even by death, the old law of piracy holding good to the present day.

The popular method of raising ships in difficulty—the one which Commodore Young has resorted to in most of his work—is that of lifting them by huge steel wire hawsers placed under the ships, and then floating them at high tide by the aid of lifting craft arranged on either side of the stricken vessel.

For instance, the *Ranger*, a sort of "first aid" ship of this type, holds the record of rescue work at sea.

While in war service, the total distance steamed by the *Ranger* from casualty to casualty around the British Isles was nearly 17,000 miles.

The *Linton*, a sister ship of the same class, had almost as enviable a record, and both were used in the work com-

SALVING A SHIP THAT TURNED OVER AFTER AN ACCIDENT

pleted only recently at Zeebrugge. Both ships are now retired from the Admiralty service.

One of the quickest pieces of work accomplished by the Linton and her expert crew was in raising the steamer Devona, which was sunk after a collision. Her cargo consisted of about five thousand tons of grain in bulk and fifteen tons of flour. When overtaken by the Linton, she lay with decks submerged fore and aft. In three days' time she was floated and taken alongside the wharf at Southampton.

A rescue that won the Ranger and its crew great praise from the Admiralty was that of the steamer Westmoreland. She was carrying a general cargo from the colonies. The estimated value of her hull and cargo exceeded twelve million dollars. She was torpedoed and sunk off the Cumberland coast, in a very exposed position, and at high tide had sixteen feet of water over her upper deck. After three months' arduous work she was eventually salvaged by the Ranger and towed to Liverpool for repairs. In ordinary times her valuable cargo would have been considered a total loss. Divers were set to work. They crept through the shaft tunnel, and, making holes under the flooded holds, drained these into the stoke-hold and the engine-room. The holes were plugged and the holds filled with compressed air. This same operation was then applied to the stoke-hold and other compartments, and grad-

ually this large and valuable steamer was lifted up on the beach. The whole of the cargo was salvaged. The cargo, much of it being taken off onto other vessels, lightened the stricken vessel considerably, so she was more easily floated. In a few weeks' time she was back in the service again, and the cargo, so much needed for the armies, was completely saved.

In these days of standardization it is interesting to know that the first-aid repairs to damaged ships are effected with a standard patch. This patch is fixed and held in position by an extremely ingenious contrivance of wires and weights, and is applied as soon as the ragged edges left by the accident are removed. The process enables the work of repair to be carried on from the inside of the ship.

Such salvage work, however, is performed under the most hazardous conditions. Of course bad and stormy weather adds to the peril, and, as Commodore Young pointed out, it is clear sailing in fair weather, and only stormy weather brings wrecks at sea. Then, too, work which has taken days to perform is sometimes swept away by a single heavy sea.

Another very great difficulty with which salvage work is faced concerns the big accumulation of gases in the holds of sunken vessels. The gases caused by grain give the most trouble. Grain develops sulphureted hydrogen

(and this often causes semi-blindness and violent sickness to the men employed on this kind of work) as well as other dangerous gases which are fatal to human life. However, a chemist during the war discovered a preparation which meets this difficulty somewhat. This preparation is sprayed over the rotting cargoes and quite effectively kills the gases, or, after being sprayed in a compartment filled with deadly gases, quickly renders it safe to work in.

One of the most thrilling experiences of the salvage section was the rescue of one of the largest and most up-to-date British submarines during the war. She was undergoing her final official trial and was making one more dive, when she failed to reappear. The salvage ship Thrush, lying near by, was immediately despatched to the scene, and was soon joined by the Ranger. These two salvage craft, after considerable difficulty, succeeded in locating and lifting one end of the submarine sufficiently to effect the release of forty-seven of the officers and crew, after they had been imprisoned at a depth of eleven fathoms for fifty-eight hours. In this operation tremendous risk was taken, for, only a short while after the last survivor was extricated, the lifting wires carried away and the vessel sank again. Nevertheless operations were at once begun for refloating her, and by means of compressed air all water was expelled from her, and eventually she was brought to the surface

TWO LIFTING CRAFT WITH SUBMARINE BETWEEN (WIRES ATTACHED TO HOIST THE U-BOAT)

and some time after was put back into commission.

Perhaps few outside of those who actually were engaged in this dangerous business at sea during the war will ever appreciate what this work meant to the Allies, and what it would mean in case of another great war. Thrilling stories of burning ships at sea after an explosion had occurred in the hold, setting fire to dangerous explosives being carried to the seat of war, and how salvage crews working in the face of death succeeded in laying the fire and saving the ship, could be enumerated at length by these men.

Lifting huge ships weighing several thousand tons by means of steel wires and the aid of lifting craft appears an impracticable thing to the lay mind. However, hundreds of sailing vessels now in good condition can testify to this excellent method of saving a ship's life. Commodore Young worked out this plan to perfection in all his operations at sea. If a ship sinks in a reasonable depth of water, permitting the work of divers to be carried on, there is hope of saving her, even though the storms may hammer her severely and the tides harass her.

The divers are first set to work to locate the sunken vessel, and after this a number of steel lifting wires, each capable of bearing a strain of 250 tons, are placed under the ship, the number of wires varying according to the weight of the ship to be lifted. In the case of a small British cruiser thirty-two of these lifting wires had to be placed under the vessel, which had sunk eighteen feet into the clay. It will be seen that the operation of placing these

cables is a very difficult one and cannot be done by the divers' efforts alone, so compressed air and hydraulic appliances are used to cut passages under the ship. When this has been accomplished, lifting vessels of sufficient buoyancy to carry the sunken wreck are brought out and placed on each side of her. In order to prevent these lifting vessels capsizing or taking too great a list, an interesting method of making the cables fast is adopted; i. e., one cable is taken from the inside of the lifting vessel

under the sunken ship to the outside of the opposite lifting vessel and from the inside of the opposite lifting vessel to the outside of the other one, making a cross in the cable. The wires are then tightened by machinery and made fast across the decks of the lifting craft by heavy clamps. See the accompanying diagram. The lifting vessels are fitted with compartments which can be filled and emptied by pumps. At the commencement of the operations all the compartments are filled with water, and after the lifting cables are made fast they are pumped out, and the tide does the rest—that is to say, the ship is lifted the height of the rise of tide and taken towards the shore until the water is shoaled, when the operation is repeated until the vessel's decks are dry and she can be patched and pumped out in the ordinary manner.

Sometimes several efforts are necessary at high tide before the ship begins to crawl out of her mud-hole and dips her helm into the swiftly rising sea.

This operation is not carried out as easily as it sounds when telling about it, and to this fact may be attributed the failure of many who have attempted to wrench from the sea its secrets of hidden treasure.

The only big job on which work is now going on to a limited degree and on which some progress has been made concerns the salvaging of some part of the millions' worth of gold bullion which went down in the *Laurentia*. The ship lies in a great depth of water, which makes the work slow and hazardous, and only small success so far has been achieved by the occasional divers on the job.

LIFTING LIGHTERS IN POSITION (WIRES SECURED AND PINNED AT LOW TIDE)

TRUMPETS AT JERICHO

BY LESLIE NELSON JENNINGS

TRUMPETS at Jericho! The thunderous fall
Of masonry! Can you so soon forget
That silver music fingering the tall,
Doomed towers of eld to think them standing yet?
With bleeding hands laboriously you set
Stone upon stone, and built yourself a wall,
Strong to endure in scarp and parapet,
Above disaster, mightiest of them all.

There, in the lonely turret of your star,
Impregnable, sequestered, undismayed,
You watch while constellations flame and fade . . .
Have you not heard a whisper where you are?—
A burst of silver music sternly blown
Before the gates of kingdoms overthrown?

MEN WHO MAKE MONEY

BY WILLIAM P. HELM, JR.

SOMEWHAT more than seven years ago a group of twenty-three business men sat down to make out their Federal income-tax returns for the year 1914. All of them had experienced a disastrous year; some of them were virtual bankrupts.

As they lived in different sections of the country and were not personally acquainted, they could hardly be called a group except for the act of the Internal Revenue Bureau at Washington which, upon receiving the returns, classified them under one heading. In that manner these men became grouped. So far as the Government was concerned, they were rank failures. They not only reported no income whatever, but had lost money during the year to the extent of more than a million and a half dollars, an average of nearly seventy-five thousand dollars apiece.

Of course they paid no income tax. All they contributed toward the revenues of the Federal Government was the information contained in their returns. That was of no special value at the time; and, as it costs money to check and verify returns, these men, in fact, were a financial burden upon the community rather than an asset to it.

On the face of the returns, they had in common but one thing—failure. But something that did not show upon the face of the tax returns—something no tax return has ever shown or ever will show, because it is beyond human ingenuity to show it on paper—also was a common possession.

That something was the ability to come back.

In 1919, five years later, the Government's statistical experts at Washington

selected for purposes of comparison those twenty-three returns from the big sheaf where it keeps its record of men who have failed. There was a reason for this selection. The reason was that those men had all come back. At some time within the five-year period each one of those failures had lifted himself out of the failure class. Each one had made net \$300,000 or more in a single year.

One of them made in a single year \$548,000; another made \$980,000; a third passed the million-dollar mark by more than \$73,000; a fourth made \$1,373,000; and the fifth hung up a record of \$1,608,000. The fifth man, incidentally, accomplished the feat within twelve months, reporting his maximum earnings in 1915.

The story of those twenty-three men is not fiction. No facts are so cold as the facts of the income-tax return. In making them public the Government offers no analysis of the causes which contributed to success or failure. It simply gives the bare results in the cold, unemotional atmosphere which attaches to long tabulations of figures with the dollar mark before them.

Who were these men? Again the Government is silent, for the law forbids publication of anything which would establish the identity of a taxpayer. The Tax Bureau is long on figures, short on names. But if any one cares to check the information, it may be found on page 101 of the Treasury Department's recent bulletin, "Statistics of Income for 1919."

How these men accomplished their come-back, therefore, will never form text of preachment from platform or pulpit. It is a story lost to the world unless

they themselves come forward to tell it. We only know that they did come back. It used to be that such stories were found only in fiction, but that was before the Government of the United States began the publication of sworn and verified income-tax returns.

There are other stories in the small-typed figures that lie between the reddish-brown covers of the Government's bulletin; stories of success beyond the novelist's wildest dream; stories, too, of men who fail.

In 1919 there were eleven men in the United States who made more money than any one else. Their joint incomes for the year aggregated more than \$71,000,000. None of them earned less than \$3,000,000. The average was about \$6,500,000.

The earnings of those men have been traced back by the Government. Although the search extends back five years, it is necessary to follow it only one year, or to 1918, to find what is perhaps the most dazzling contrast that illumines the entire records of the Treasury Department.

The record discloses that in 1918 these eleven men enjoyed about the same total income. Five of them, however, had incomes averaging \$7,500,000; two had average incomes of about \$2,750,000; and three others had incomes varying from \$567,000 down to \$270,000.

The eleventh man's income in 1918 was exactly \$6,688.

How would it feel to jump from a \$6,700 income to a \$3,000,000 income within a year? That man knows. He knows what it is to increase his income by at least forty-four thousand per cent within twelve months. He probably is

the only \$6,700 man in the United States who has ever enjoyed the sensation.

Those who profess to believe that the United States no longer holds out possibilities for making money that it held out in the past would do well to ponder on what that man has done.

Obviously, from the Government's tabulation, that man was a millionaire even in 1918 and had millions to work with. In that year, apparently, his investments went wrong, for prior to 1918 he enjoyed an income of not less than \$287,000, that being the minimum income reported by any of the eleven men in his group for 1917. His case, therefore, is not that of a salaried man who made a financial killing.

But there are such cases apparently. Take the case of the fifty-nine men who earned \$10,000 a year or less in 1914.

That group of individuals earned an aggregate of \$380,000 in 1914. They therefore averaged slightly more than \$6,000 apiece.

In 1915 their earnings jumped to \$6,600,000, an increase of more than sixteen hundred per cent. One of the fifty-nine earning less than \$10,000 in 1914 earned more than \$2,480,000 in 1915. He boosted his income by nearly twenty-five thousand per cent within the year. It was his best year, too, for the highest single income reported thereafter by any individual of the group was \$40,000 less than that man's 1915 income. It may be that the same man reported both of these huge incomes. On that point the Government's statement, censored by the law's requirements, is silent.

There are many more such stories in the tax returns—hundreds of them. They are all true, for the Government's trained investigators have checked and verified the figures. They are stories of men who came back. There is such a sameness to them that one would tire of reading further instances. But they all illustrate, far better than water-colors or oils could possibly portray, that in this land of opportunity there is no such thing as failure for the man of energy and brains.

Turning the page, we find another story in the tax returns. It is not such pleasant reading as the one just told. It is the story of the millionaires of yesterday, the men who have made money and lost it. And again the Government is silent as to names or causes which brought about the losses.

Twenty-six men, for instance, each made from \$1,000,000 to \$1,500,000 in 1914. Since then, however, only ten have held their ground or prospered. Those ten lifted themselves up to an average of more than \$2,500,000 in 1919. Two of them averaged \$7,000,000 apiece. The other sixteen failed to maintain the pace they set five years before. Their incomes dropped from \$1,000,000 in 1914 to from \$600,000 apiece in the case of three men down to losses of more than \$250,000 apiece in the case of two men in 1919.

What caused these men to lose? Was it that their business judgment, so sound in 1914, waned within five years? Or was it that, having made their fortunes, they relaxed to lives of ease? Were they victims of their own misplaced confidence? Were they spend-thrifts? Couldn't they stand prosperity? The list of questions that comes to mind is curtailed only by the imagination of the individual asking them.

Those questions probably will never be answered. The record of failures is sealed in the Government archives as securely as the record of the men who have come back to prosperity from the land of adversity.

He who wants to read the future may learn the average of his prospects for success or failure by studying the tax returns.

They show, for instance, that coal mining, popularly regarded as a certain road to wealth, is one of the most hazardous ventures to which dollars can be put. More than 3,200 corporations were engaged in the industry in 1919. More than half lost money. Those that prospered made an average of fourteen cents a ton, net, on the annual output of these mines.

Those figures and the ones that follow apply only to corporations. The Government has classified their tax returns. It has not so classified the individual returns. Hence a comparison between corporation and individual endeavor in any branch of industry is unobtainable. The returns of corporations, however, are illuminating. What is more important, they are correct—to the dollar.

Of all corporation activities, the banking business is the safest. The Government's figures show that of the 28,000 and more State and National banks and trust companies more than 25,000 operated at a profit in 1919. Thus the chances of making money in that business, as measured by the tax returns, are nine out of ten.

Ten per cent of the banks lost money during the year, but not much, the average loss being about \$400. Doubtless every one of these was financially sound, even though it failed to make a profit. State and Federal governments safeguard these institutions so thoroughly that a bank failure these days is an extreme rarity.

The man who owns a gold mine, the tax returns show, has one chance in four to prosper—no more. Of more than 500 gold, silver, and precious metal mines operated by corporations in 1919, 122 made money. Their total profits were slightly more than \$5,000,000. Nearly 400 lost money, their losses being nearly \$11,000,000.

Even so, the average of success in gold mining was higher than in copper. One copper company in eight made money in 1919. True, the year was unusual, and the copper industry was hit harder, perhaps, than most others. Nevertheless the most unfortunate investor in the country, according to the

tax returns, was the man who owned a copper mine that year. Next to him among the unfortunates was the owner of a gold mine.

Chances of making money in oil are about one in three. Nearly 3,000 corporations engaged in the oil business filed returns for 1919. Nearly two-thirds reported losses. Next in hazard was cotton farming. Again it should be remembered that the figures apply only to corporations. Eleven cotton-farming corporations out of twenty-one made a profit. The corporation in that business had about a fifty-fifty chance to succeed.

In the field of manufactures the maker of textile fabrics took first place as a money-maker, with the boot-and-shoe manufacturer crowding him hard. The textile manufacturer had seven chances to win and one to lose, and the industry applied itself to its work with such excellent skill that its earnings totaled more than \$625,000,000 and its losses less than \$5,000,000. The boot-and-shoe manufacturer had a shade less than seven chances out of eight to succeed. In the aggregate his earnings totaled nearly \$110,000,000 and his losses but little more than \$750,000.

The clothing trade, the figures show, offers a reasonably safe field for activity, but conditions are spotty with respect to different branches of the industry. Makers of men's clothing, suits and overcoats, were more than ninety per cent successful, but the high average attained in that branch was lowered for the industry as a whole by losses in other branches. The man in the clothing business, the tax returns say, has slightly better than five chances to win against one to lose.

Among smaller corporations, chances for success were greatest in the saddlery and harness business. Of every twenty-four corporations in that line twenty-three prospered in 1919, although the average profit was slightly less than \$50,000 for each concern.

But nowhere in corporation activities is there recorded a parallel to the achievements of the individual. The man who comes back soars infinitely higher than the corporation. He may carry the standard of his success up to twenty-five thousand per cent increase in earnings within a single year. To such an individual success comes with the irresistible force of an avalanche, sweeping all obstacles before it, grinding them into the dust over which it advances.

Not so with the corporation. Its earnings rise and fall, but, like the tides, they observe well-marked and definite limitations. All the corporation-owned gold mines in the country won but a fraction of the success achieved by two unnamed individuals in 1919. No corporation may count among its assets the boundless measure of the individual's most valuable possession—that possession which is not reported on the tax return and never can be so reported—the ability to come back.

THE BOOK TABLE

IN TERMS OF AMERICAN LIFE

BY FREDERICK M. DAVENPORT

AS the aftermath of the war has settled upon the world, men have become less and less satisfied with a naïve and immediate explanation which involves only Germany and the unfortunate Archduke Ferdinand. Men's minds have become centered upon Western civilization itself—how thin the veneer of it, after all, how subtle and yet how vast the forces of disruption which lurk beneath the surface, what a battle it is to preserve the civilization which a few years ago we thought strong enough to endure the assaults of every foe! Lothrop Stoddard has shown in his most recent book¹ how the danger to what is best in modern civilization is deeper than the war. The war has hastened the oncoming of the danger, has shaken and strained civilization to the breaking-point, has hastened racial impoverishment; but the real causes of what the world is now experiencing lie deeper than the war.

The first fact we have to face is a fact of biology—that some racial stocks are permanently weak and some are strong; but the strongest peoples, the strongest stocks, of to-day have no greater physical or intellectual capacity than the strongest stocks of civilization long buried in the past. The germ-plasm of capacity flows at approximately the same level through the centuries. The acquired characteristics of individuals of one generation are not transmitted to the individuals of the next. Each generation may develop a more complicated social environment and pass it on; but each new generation takes over the more difficult and complex environment at the cost of distinct and increased effort on the part of the individuals of the new generation, who have no greater inherited capacity to bear the burden than those who have gone before, and who, in the experience of all civilizations hitherto, have shown a progressively weakening capacity to bear the burden.

The tendency of civilization is to rear a greater and greater structural load upon its human foundations. That is peculiarly true of our own civilization. Power, organization, wealth, luxury, leisure, art, science, learning, government, a vast complex of values good and bad, now engage the energies of man. And a brain famine has set in. Neither in government nor economics, the two fields in which extraordinarily wise leadership is indispensable to civilization, do we find in the world to-day the intellectual capacity or the character to bear the increasing burden. Misgovernment among the nations and a world-

wide economic and industrial warfare are the ripe fruits of this incapacity.

There have been many civilizations in the past, great civilizations, and they are all gone. Modern biology makes it clear to us that there is no law of the decay of civilizations, but there are reasons for it. In the period of barbarism and savagery the weak, the stupid, and the degenerate were ruthlessly eliminated in the struggle for life and livelihood. In civilization the delinquents and defectives, the unadaptable and the incapable, have not only been supported by the superior stocks, but have bred to their desire's content. It is humane to care for the insane, the habitual pauper, or the instinctive criminal; but is it in the interest of civilization to allow him to reproduce his kind?

But that is not all of it nor the worst of it. When a race enters into civilization, it enters "in the pink of condition." In the earlier stages of its history it has eliminated its weaklings. The superior individuals have the choicest mates and the largest families. These are the simple values of the time. But we know that the expanding desires and demands of civilization alter that. A distinguished biologist of New England reckons that at the present rate of reproduction a thousand Harvard graduates of to-day will have only fifty descendants two centuries hence, whereas a thousand Rumanians in Boston, at their present rate of breeding, will have one hundred thousand descendants in the same space of time. Biological regression, the scientists call it. Not complete, because there may be many individuals in the Rumanian stock capable of climbing the social ladder and becoming superior; but the best-trying stock, the stock we know about as fit to organize and apply sound social control to civilization, is passing in many important parts of America.

But that is not all. There is a large element of primitive traits in most populations—people unadapted to progress, of wild nature, who have no desire nor capacity to keep pace with civilization. They are continually on the border-line of unrest and revolt. In ordinary times social control represses them. But in time of war, in time of vast dissension, of profound political or industrial or social injustice, "they gather themselves for the spring." They feel themselves to be permanent under-men. They know that civilization is not, can never be, for them. They are always ready, with reasons good or bad, for a revolt against orderly progress, against civilization.

In time of grave economic and social injustice in the latter part of the eighteenth century this human element

showed its teeth in France, and frequently and yet more frequently in various corners of Europe during the nineteenth century. This was the time of the triumph of machine industry and capitalism, when abuses were rife, when a great number of people were precipitated into the depths who did not belong there. Mere evolution towards political liberalism became too slow. Karl Marx and evolutionary Socialism raised its head. Then at the close of the nineteenth century appeared Georges Sorel and revolutionary Syndicalism—the state to be abolished, but a federation of trade unions to take its place; the class struggle, direct action, the general strike, sabotage, frightfulness, chaos, the dictatorship of the proletariat, "the war of the hand against the brain."

The most startling phenomenon of the aftermath of the Great War exhibits this reversion to the primitive in Russia, a country which occupies one-sixth of the earth's surface and embraces a population of 150,000,000. Russia, a land of wild, barbaric racial strains, having yet hardly learned the alphabet of social order, is the natural home of this fierce outburst of rebellion against the good and evil of civilization. Cold and nakedness, plague and famine, arrogance and terrorism, the tragic destruction of the middle class—these be the early fruits of the revolt against civilization. But the clearest revelation of the primitive sub-consciousness which now rules Russia, whatever Tchitcherin and Lenin may say, is the attitude of the proletarian Government towards the intellectuals of Russia, who, as Stoddard writes, "have long stood bravely between the despotism of the Czar and the benighted masses, striving to liberalize the one and enlighten the other, accepting persecution and misunderstanding as part of their noble task." These have been killed and starved and driven into exile by the new radicalism of Russia—the revolt of the new radicalism against superior intelligence. It is the same hatred of genius and learning which Robespierre showed by sending the great chemist Lavoisier to the guillotine with the remark: "Science is aristocratic; the Republic has no need of savants."

All this mainly, though not entirely, according to Stoddard. And now, speaking mainly, though not entirely, personally, I know it is part of the question which split the Genoa Conference, and I know it has distinctly two sides; but I yet hold that the policy which was back of the refusal of Secretary Hughes, of our Government, to recognize or treat with the emotional sub-conscious class mind of the Russian Soviet in its arrogant revolt against civilization is the surest statesmanship to follow. If America is to err at all, America errs safest on that side.

I am not one of those who believe that

¹The Revolt Against Civilization. By Lothrop Stoddard. Charles Scribner's Sons, New York. \$2.50.

America has no concern with the affairs of Europe. I am no apostle of perpetual aloofness from the remainder of mankind. But I hold that America, as well as Europe, must first become a better master of herself. There is more promise in American life than in the life of any other land, but there is many a threat of peril in American life as well. The laxness in economic and social and vital morale has a foothold in America—had it long before the war. It is a part of the deterioration of character wherever the prosperity of the industrial revolution in the last hundred years has carried greatly and suddenly increased welfare to large numbers of the population who had formerly struggled in hardship and straitened circumstances. Steam and electricity and gasoline, "rays and waves and powers" of which man had never before dreamed, have produced a volume of comforts, commodities, opportunities for ease and luxury, for large numbers of people in America never enjoyed before in the history of the world.

The war taught us something. The intelligence tests which we administered to more than 1,700,000 American officers and men demonstrated two things—first, that the average intelligence of the rising generation in America is not high, and that that precious factor itself is being steadily bred out of the American population by the rapid influx of certain inferior racial stocks, or at least of a multitude of inferior representatives of certain racial stocks. Where are your great thoughtful Americans, without whose vision the country perishes and of whose genius America never stood so much in need? Marshall could think; Lincoln could think, no man of his day more clearly, more deeply, than he. Where, in the world of industry and politics in the more democratic America of our time, are the superior men of vision who can think—men of character, sympathetic with popular freedom and capable of leading the people to act upon their thinking? Governmentally we have not been left entirely desolate. From Hamilton and Jefferson to Root and Roosevelt and Wilson and Hughes the American democracy has been helped by availing itself of the disciplined thinking and guidance of men of great intelligence, who have usually acquitted themselves with distinction and discretion. But the tide of democracy, bearing fears as well as hopes, sweeps resistlessly on, with disquieting symptoms of industrial immorality, of social inefficiency, of governmental feebleness, of public inertia upon affairs National and international. All the more need is there that the brains and conscience of the leadership of democracy should keep pace with the march of democracy.

Whether we advance or retreat in America depends, in the last analysis, upon whether we are led by a dynamic minority of brains and sympathy or by a dynamic minority of mattoids and morons. That means of course, in terms of biology, that we must breed from the right stock. And that means that

America must pick the representatives of her immigrant racial strains with a good deal more care than she has since the Civil War.

And it is not all in heredity. If the structural load of civilization weighs too heavily upon American human kind, we can lessen the load. We can alter our values. It is time we did it. It is time we thought far less of commercial values, of speeding up for riches, of luxury and materialism. It is time as a nation that we paid more attention to a life that is simple, to the things of the mind, of taste, and of culture—far less costly, but also in the best sense far richer. We thus follow the social philosophy of our distinguished American sociologist, Giddings. As he urges, we can employ the simpler and more spontaneous, more co-operative ways of getting things done as against the method of getting them done by Governmental agencies with enormous overhead, waste, inefficiency, armies of civil servants. The evolutionary and cultural ways rather than the revolutionary and coercive ways are much less costly and would enormously diminish the operating expenses of civilization.

The concentration of superiority in the higher levels, where it can be most effective in leadership, depends upon how well the channels of opportunity are kept open in America, so that the best in the lower levels may be drained into the higher levels. This we call in America equality of opportunity—the only kind of equality which nature or a sound philosophy believes in. Of later years we have not been so true to this American philosophy. We have adopted "leveling" practices. In American public education we have developed a tendency to run every boy or girl, bright pupil or dullard, through the same mold. The intellectual work of the student bodies in our colleges as a whole we have leveled down to the average or below the average; precisely as some of the labor unions do which debase and discourage bright workingmen by the "go-slow" rules of the union. There are large numbers of students in every college—the best of them from the standpoint of future leadership—whose powers find insufficient outlet and interest in the mass-curriculum constructed for the mass-average. There is an increasing multitude of workingmen who under a false doctrine of equality are having their capacities leveled to the mediocre.

Revolutions never happen. They are caused. They are precipitated mainly by inefficient government, burdensome taxation, by arrogant and greedy industrialism. They follow the previous undermining and discrediting of the existing social order. The wild race for armament, the resulting intolerable weight of taxes, the economic materialism of the ruling classes of Europe, precipitated the war and the revolutionary aftermath of the war.

Bourbonism prepares the ground for revolution. Bourbonism promotes material progress, but chokes human progress. Bourbonism blocks reform, breeds

discontent, thickens the crust of reaction, brings on the earthquake and the cataclysm.

I do not find myself able to follow Mr. Bryan before Southern Legislatures, Southern churches, and Southern college commencements in his flaming opposition to the theory of evolution. In the field in which Mr. Bryan is more at home, the field of ethics, I frequently find little difficulty in following him. I hold with him that civilization is expanding morality. I distrust, with Stoddard, those who all over the world are in violent revolt against civilization, because they make their appeal to envy, hatred, and malice instead of seeking to attain peace on earth, good will among men. They have chosen direct action, sabotage, the general strike; proletarian violence, the ruin of transportation, the paralyzing of economic life, the path of chaos, and not the path of righteousness and peace.

By right of her vast economic and moral reserve, America is fitted for the leadership of civilization. She is not yet ready to lead. She does not yet feel herself experienced enough to lead broadly in the great advance. But the period of caution and aloofness cannot last forever. More and more her wisdom will be sought in the councils of civilization. But her safety and honor at home and abroad can be preserved only by a superior human stock that will choose the right values, simplify its life, perpetuate its breed, and learn increasingly to think.

In little more than a Century

He has advanced

Civilization by

Ten Centuries!

IT is as difficult for you to realize how much the Chemical Engineer has contributed to your daily life as it is for your little son to realize the wonder of the motor cars that glide up the Avenue: you are so used to it all.

But, turn the pages of history a century . . . and then, a few more centuries, and the infinite changes in life, the abundance of comforts and conveniences, and the luxuries that the Chemical Engineer has brought into today's civilization, are written in letters of fire.

LIFE has changed more in its essentials since the time of Thomas Jefferson . . . and remember, that was in your great-grandfather's day, than Jefferson's life had changed since William the Conqueror's days. In little more than one century Civilization's frontiers have advanced farther than they had advanced in eight centuries before!

Journeys in 1806 were matters of horses' endurance just as they were in 1066; Jefferson's coach may have been easier to ride in than the Norman duke's slower vehicle . . . but what is that to the smooth-riding motor that whirls you along at a mile a minute?

Rushlights are not so far from tallow-dips as tallow-dips are from electric lamps. Jefferson's buildings rose little higher than William's . . . but what of the structural steels that make it possible for today's Woolworth Towers to pierce the skies? The doctors of 1806 took nearly as many chances as those of William's reign . . . but the Chemical Engineer has placed in your doctor's hands specifics that silence forever the threats of many of man's dreaded scourges.

So you may run the gamut of life's needs and comforts, and you will find that, although life did change in the passing centuries from the autocratic Norman to the democratic Jefferson, the changes were mostly refinements . . . seldom radical additions to man's possessions.

Yet the few years from Jefferson's day to yours are marked by startling, by radical changes in the way of living, changes possible only through the Chemical Engineer's slowly-won mastery over nature's elemental substances and forces . . . by his miracles in metals, in petroleum, in textiles, in rubber, in explosives, and in dyes and drugs and chemicals.

* * *

IT is the growth of industrial chemistry that has made the past century the most wonderful period in man's history . . . for the Chemical Engineer's province is the mastery of matter, the transformation of matter from useless to useful forms. He has in a few years changed the entire face of industry, and it is to him that the world's industries look in the future.

We, of the du Pont organization, which for 120 years has been building on this foundation of applied chemistry, take no little pride in the contributions that du Pont Chemical Engineers have made to the development of industry in the United States.

This is one of a series of advertisements published that the public may have a clearer understanding of E. I. du Pont de Nemours & Co., and its products.

AMERICANS IN GERMANY

IF the people of Germany as a whole hate America with the fervor indicated by Mr. Danziger in "See Germany Last," I am sure that they should be extremely grateful to him for his zeal in discouraging an influx of American visitors to that country. His elucidation of the present situation and of the attitude of the German people interested me exceedingly, largely because his impressions were so far different from my own. I have not visited Bremen or Hamburg since the war, but, having been called upon to travel through southern Germany last autumn in a semi-official capacity, I returned with a very definite impression that an American was far from the least welcome of foreigners there. In the Black Forest region of Baden, Württemberg, and Bavaria there was little or no over-charging, little or no promiscuous robbery; a marked absence of any hostile feeling. I understand that at least up to a month ago the same conditions of friendliness were generally maintained. I did, indeed, visit Germany with many misgivings, with a considerable store of bitterness engendered by service in the A. E. F., and with a very fresh mental photograph of the "Zone Rouge" of France. I brought back with me no amended conception of the German character, no desire to extoll the collective humanity of the people, and no wish to struggle for the mitigation of the rightful penalty which Germany must suffer. The Englishman and the American, however, are fundamentally fair-minded, and not vindictive. As Mr. Danziger points out, Germany is suffering for her wrong-doing. Is it not, perhaps, time to stop agitating an old feud, time to smooth over the extreme bitterness of an "eye for an eye" policy?

A year ago much was being said by the American newspapers in Paris in regard to the manner in which French shopkeepers were robbing Americans, in which French hotel-keepers were over-charging, and French minor officials were grasping for a hundred and fifty per cent "backsheesh." "See Germany Last" might almost be a transcription of an editorial from an American newspaper edited in Paris last summer. Its slogan was "See Paris last." We all decried the grasping attitude on the part of the French, but France was and is our ally, and most of us tried our best to prevent any bitter feeling arising from existing economic conditions. Had any American magazine attempted to publish "See France Last," there would have been cause for just condemnation. Should we judge all France through the attitude of the Parisian shopkeepers and hotel-keepers? Should we judge all Germany through the bitterness and disorganization of a few great northern cities?

By all the signs, Germany as a whole has not reformed; it is clear that we can-

not yet trust her in the circles of international economic conference. Nevertheless the economic adjustment of Europe, and in a measure of the United States also, depends upon a mutual willingness and desire to get back to the old basis of commercial interchange. A bankrupt and Bolshevist Germany is only so much the greater menace. A solvent Germany with the careful supervision of Allied statesmen and financiers means a prosperous Europe, and indirectly a prosperous America. Vituperative criticism is a step in the wrong direction. "See Germany Last" is not inclusive of the whole country. The impression it gives the reader is fundamentally dangerous and uneconomic.

ARTHUR NEWTON PACK.

AN IMPROPER OUTLOOK?

I HAVE in my family a spinster of fifty years, very proud of her New England ancestry. She was sweeping and putting the piazza in order this morning when I was at breakfast. She came in and said: "Do you want I should pick up them books and papers out there?" I replied that she might leave them on the table. She hesitated, and then said: "Well, there's one of 'em that ain't got a very nice picture on the cover, and I thought mebbey you wouldn't want it layin' 'round."

"Is that so? What is it?" I asked. She disappeared, and in a moment returned, holding at arm's length The Outlook of June 28 with its dainty, dancing little figure.

"There 'tis," she said. "Look at that girl showin' her legs up to her knees! I think it's shameful!"

Oh, Outlook! that you should come to this!

Needless to say that when she walks abroad her skirts are of the decorous length of ten or fifteen years ago, about two inches above the sidewalk.

X. Y. Z.

THE DOWN HILL PATH

MR. JESSUP's article in a recent Outlook on "Getting Lost in the Woods" was very interesting, and was carefully read by the writer to see if the author had given the best advice to one who might be really lost.

His rule, "Keep your head and save your energy," is a most excellent one, and should be followed; but there is another rule, which was given to me by an old prospector in the mountains in Wyoming many years ago. If this be added to Mr. Jessup's rule, the combination will be pretty sure to get a lost person out of the woods.

This rule is, "Always go down hill." If you follow this rule, you are sure to strike a stream, and if you follow down the stream, you are sure to come to a habitation, and quite sure to find it sooner than if you wandered up hill and down.

Some years ago the writer was on a fishing trip in the Rocky Mountains with

Mullen Bldg., Cedar Rapids, Iowa. Heated from Central Station.

Residence of D. A. Phillippe, Champaign, Ill. Heated by steam from power plant 4,308 feet away.

AdSCO Graduated Radiator Valve. Gives positive control of radiation.

**No Coal Goes In—
No Ashes Go Out!**

No basement fires. Steam from a Central Heating Plant—piped through underground mains and sold by meter the same as water or gas—heats these buildings.

Heat available day and night—controlled by an AdSCO Valve on each radiator as positively as water at a faucet.

For 40 years we have been installing AdSCO Community Heating; now used in more than 400 towns, industrial plants, institutions, groups of residences, and office buildings.

Cost data and information about profits from Community Heating sent on request.

Some steam plant in your neighborhood may be wasting enough steam to heat a group of buildings:

Ask for Bulletin No. 20-O on "AdSCO Community Heating;" Bulletin No. 138-O describes AdSCO Heating for individual buildings. Name of your architect appreciated. Architects, engineers and heating dealers should write also for Bulletin 139-O.

a friend, who was lost for three days and three nights.

If he had followed the rule of going down hill, he would have reached a ranch within six miles, or, in his case, if he had simply gone back to the river and sat down in the sun, the searching party would have found him after the first night. He became bewildered, however, and must have wandered aimlessly over the hills and valleys, as he certainly eluded about forty men who were scouring the country for him.

My friend was over seventy years old. Although it froze hard each of the three nights and he had fallen in the river and wet his matches so that he could not light a fire, and he had noth-

ing to eat except service berries, which were plentiful, he suffered no ill effects from the exposure after a few days' rest.

"ONE OF THE OUTLOOK FAMILY."

A WORD ON UNDER-WEIGHT

A review in a recent issue of "Mind and Body" of your article in The Outlook on "The Great Under-Weight Delusion" makes me feel glad that at last somebody has up and said what I know personally some men of recognized importance in public health work, as well as my humble self, have been thinking.

To serve as a help to those who are struggling for a career

FROM IMMIGRANT TO INVENTOR

A SERIES OF THREE INSPIRING NARRATIVES

by MICHAEL PUPIN

(C) Underwood & Underwood

- | |
|---------------------------------|
| 1. WHAT I BROUGHT TO AMERICA |
| 2. THE HARDSHIPS OF A GREENHORN |
| 3. FROM GREENHORN TO CITIZEN |

Others in preparation

RARELY has there been the equal of this true story of Americanization. Professor Pupin, a Serb by race, ran away from school at fifteen. Lured to America by what he had read of the Land of Freedom, particularly attracted by the characters of Benjamin Franklin and Abraham Lincoln, he landed at Castle Garden with nothing but the clothes he wore—a red fez on his head and five cents in his pocket. Now, he would not be allowed to land, but more than forty years ago he got in. This is the marvelous tale of the poor boy, educating himself by the labor of his hands and then taking high honors, becoming a professor at Columbia, and the famous inventor of the Pupin coil and system of electrical conductors used in all long-distance telephone wires. The story is human in every page, from the lonely boy acting as herdsman on the pasture lands at home, guarding the cattle from Roumanian neighbors, and signalling through the ground, to his contact with the great scientists abroad when he achieved a position among scholars and investigators. The author believes that the narrative will serve as a help to those who "are struggling to build up for themselves an independent career, and also to people who are interested in our new national problem, the problem of Americanization." The three chapters mentioned above will be published in *Scribner's Magazine* this fall, and others will follow in 1923. To begin

BY THE WAY

A LOCOMOTIVE engineer asks in the "Railway Age" how we are to get reliable engineers in the years to come. Engineers, it will be noted, are usually raised from the rank of firemen. "The rising generation is getting a better education," he says, "and an educated young man absolutely will not take a job firing the present-day hogs with a scoop. I don't blame him—I wouldn't do it for a dollar a mile. Therefore we are already commencing to get, as firemen, men who a few years ago would not have been considered as anything but common labor for such jobs as track repair work. We have some now who cannot speak clear English and have to ask the engineer to write their names on the time slip. Can you imagine the type of engineers they are going to make?" This is a problem which the railway unions as well as the employers must look into.

The Society of Automotive Engineers, at a recent meeting, decided upon a standardization of body nomenclature for automobiles, and chose fourteen definite body names. The most significant of the changes recommended is that the word "phaeton" should replace the familiar "touring car," which term seems to have lost its significance, as all types of cars are used for touring. The names suggested are as follows: Roadster, coupé, phaeton, sedan, berline, limousine, brougham, landaulet, sedan-landaulet, brougham-landaulet, berline-landaulet, coupé-landaulet, limousine-landaulet, cabriolet.

A correspondent writes: "In a recent number of The Outlook I noticed a brief article about General Sheridan's war horse, in which the horse's name is given as Winchester. The correct name of the horse was Rienzi, which you may verify by consulting 'Personal Memoirs of P. H. Sheridan,' Volume I, pages 177-180."

Stemming a tide of "dehydrated" alcoholic beverages of reminiscent names is a steady job of the fraud department of the Post Office Department. Using the reputation of the German chemists, certain German concerns have distributed hundreds of thousands of circulars in the United States offering, for "one dollar only, Rhine wine, Moselle, sherry, Port, Bordeaux, Burgundy, Tokay, Malaga, beer of Munich, Pilsen, porter, ale, etc.," in a dried form. From the powders a gallon or two of the beverage indicated on the package can be made, the spurious circulars state. Despite the issuance of fraud orders, many people are still sending money to these German concerns, only to have the money returned to them by the Post Office Department. A significant requirement on every circular insists on payment in American currency.

If these powders contained alcohol, their importation would be prohibited, and since they do not have the latent possibilities advertised they violate the mail fraud statutes.

CONTRIBUTORS'
GALLERY

JAMES J. DAVIS, United States Secretary of Labor, knows by reason of his own boyhood the value of a practical education. He was born in South Wales, but came to America when he was very young and started in at the Pennsylvania steel mills at the age of eleven. Mr. Davis is a founder of the Mooseheart Home-School, of which he speaks in his article, and Chairman of the Mooseheart Governors.

LEWIS EDWIN THEISS is both farmer and newspaper writer. His name has frequently appeared in The Outlook over articles on many subjects, including farm and country life, practical philosophy, and industrial questions.

THREE different points of view in regard to the coal strike come to the Outlook office from three very dissimilar sources. One is from a coal miner who signs Francis Pridemore as a pen-name because, he says, "If I signed my own, I should never be able to get another job in the coal fields." The second is from a Presbyterian minister living in the mining district. And the third is from William P. Helm, Jr., with whose former correspondence on the coal crisis readers of The Outlook are familiar. Mr. Helm was for four years assistant to the vice-president of the National Coal Association and is an authority on the subject on which he writes.

MARION COUTHOUY SMITH has frequently contributed verse to The Outlook. The quotations in the poem in this issue are from her poem "The Interpreter," published in The Outlook of December 9, 1914. Miss Smith is the author of "Dr. Marks," "The Road of Life, and Other Poems," "The Final Star," and other volumes.

WILLIAM R. SCOTT contributes an article which is quite in line with his efforts to promote higher standards in commercial practices. Toward this end Mr. Scott established in 1920 a monthly periodical called "The Commercial Bribery and Tipping Review," which he edited and financed for twelve consecutive months. He has also written "The Itching Palm," the only book published so far dealing exclusively with the tipping custom. Mr. Scott is a Washington newspaper man with a background of several years' training in Louisville, Chicago, and New York.

RADIO QUESTIONS

Is an aerial on the house dangerous? Can you receive as well on a single wire as on a multiple wire antenna? Where is a thermo-couple used? How would you hook up a regenerative set.

You can answer these and many other radio questions from the Standard Radio Encyclopedia by A. Howland Wood, Ex-Navy Instructor and Radio Engineer. Boston Transcript says: "The beginner will want this volume for study and the expert will use it for reference." It clearly explains, by text, picture and diagram, modern radio instruments, their purchase, installation and operation and makes it easy to understand the technical articles in radio magazines and text books.

You cannot afford to be without this clear knowledge of radio, for the Standard Radio Encyclopedia costs but \$2.00, postpaid. Your money gladly returned if you are not satisfied. Order today from Perry & Elliott Co., 146X Summer St., Boston, Mass.

The Outlook

AUGUST 9, 1922

ENTR'ACTE

AT the breakfast table the Average Citizen looks at the front page of his newspaper. Obviously there is important news. There are headlines that run across three columns. He learns that the newspaper's correspondent in Washington believes that President Harding hopes that the railway executives and the railway labor leaders are expecting a settlement of the strike.

Next morning the Average Citizen turns again to his newspaper; again there is news. This time he learns that the Irish have every reason to believe that they will capture Ireland.

Another morning comes, and once more the Average Citizen finds news. This time it is to the effect that several Senators unnamed and several Representatives unnamed agree that there is every reason to expect that Congress will pass or will not pass the Tariff Bill by October 1.

So it goes. Is it an item about Russia and Germany? Then the eager reader of the newspaper learns that, although nothing has yet been accomplished as a result of the Conference at Genoa or at The Hague, there is every reason to believe that when next Mr. Lloyd George, Prime Minister of Great Britain, meets M. Poincaré, Prime Minister of France, there will come an understanding concerning the German and the Russian problems which will be more amicable than understandings between these two have proved to be in the past.

Or is it the Near East? The newspaper reader again learns that something is about to happen—either that the Greeks are about to take Constantinople or that the Allies are about to prevent the Greeks from taking it.

Or is it the theater? Then the newspaper reader learns that Mr. Augustus Thomas is about to undertake the task of hopefully exerting some kind of influence that will hereafter make the theater a better medium of entertainment and of art.

Thus we have daily presented to us, as we read the press, proof that we are living in an era of hope. All good things are in the future, where they ought to be. And most of the evil things are there, too, where they certainly belong. The good things being in the future, we can press eagerly forward to them. The evil things being in the future, we can always live in hope that they will never happen. Even Mr. Lloyd George when he talks about war does not dwell upon

the experience of mankind in the past, but paints a picture of what may happen and what he hopes never will.

Just now, therefore, we seem to be living in a blessed state of transition. What is past belongs to history, and the only news seems to be a record of expectation. A good argument may be framed to show that the *entr'acte* is the best part of the play.

THE PRESIDENT'S LETTER ON THE STRIKES

J. CLEVE DEAN is one of those upon whom greatness has been thrust. Unknown to Mr. Gompers, the unquestioned leader of organized labor in this country, not even appearing in the records which Mr. Gompers found available in Washington, in such Eastern cities as he could reach, and even in the rail headquarters at Chicago, his name, however, is now known to many who would not recognize one out of a hundred names in "Who's Who." Mr. Dean's

fame has been bestowed upon him by a letter to him from the President of the United States.

Signing his telegram as Chairman of the Railway Employees' Publicity Association, Mr. Dean warned the President that any attempt by him, or any Governor, "to operate the mines or railroads by military forces" or "to draft men into mining or railroad service would be an attempt to establish involuntary servitude." He informed the President that "the American farmer and laborer have come to realize the hostile attitude of the G. O. P. toward them;" and he supplemented this political warning by a warning of a threatened revolution.

Taking this telegram as a text, President Harding wrote a letter in the nature of an address to the country which was made public on July 26. Treating Mr. Dean's "politically partisan references with that contempt which is felt by every good citizen in the hour of deep public concern," the President proceeded to state effectively the fundamental principles on which the Government must stand whatever action it may take in this emergency.

He acknowledged the loyalty of the strikers as American citizens and their right under existing statutes "in declining to work under the terms decided by the Railroad Labor Board or tendered to the workmen by the mine operators of the country."

He denied that any one had "proposed to draft free men into either the railway or mining service, or suggested coercion under military force." The military forces of free America, he said, are used only for preventing lawlessness and violence.

The same freedom, however, which permits men to strike also gives other men the right to accept employment under the terms proposed.

The railway men are striking notwithstanding the legal provision for the consideration of their just grievances; the miners are striking notwithstanding the offer of an agency to make an impartial settlement.

The Administration in standing behind the Railroad Labor Board and in proposing the coal mine tribunal is, so far from resorting to force, resorting to the very opposite. Since the men have exercised their right to refuse the Government's remedy, the President has asked the Governors of coal-mining States to invite the mine operators to

resume mining, and to promise the protection which all men have a right to expect in their lawful pursuits. "This protection," said the President, "applies alike to the men on strike who observe en masse with men at work and to the men the law and make no lawless interference who are lawfully at work and entitled to protection by every agency of Government in that work."

"The Government . . . is opposed to all conflict among classes," added the President, and "speaks only for the American people as a whole and the common good of all its citizens."

In closing, President Harding invited Mr. Dean, and presumably every one else, to pass judgment on the refusal of the miners to accept the awards of an able and impartial commission, and invited him to urge the striking railway men to return to work under the decision of the Railway Labor Board and await the action of that Board in giving a free hearing on any question concerning which there is a reasonable doubt.

"These," said the President, "are the ways of peace."

This letter of President Harding's deserves a high place in the history of the progress which America has made and will continue to make in applying the principles of democracy to modern industry.

THE IRISH CIVIL WAR

So far as conditions in Ireland can be pictured from the despatches, the fighting in that distressed country has been changing in form. At first it seemed more like organized riots in city streets and sieges of city buildings. It now appears to have assumed the form of battles, characterized by the advance of one side and the retreat of the other, in the more open country. As July drew to its close the so-called Republican forces under the discreet De Valera, whose theory seems to be that "he who fights and runs away will live to fight another day," were retreating from Limerick and Waterford, and the Free State forces were in control of Limerick. One of the old buildings, King John's Castle, is said to have been destroyed when the Republicans set fire to it.

In one case a battle is said to have lasted three days. This was in County Tipperary.

Everywhere the Free State forces seem to have been gaining ground.

Among the casualties in the fighting is the reported mortal wounding of Harry Boland, who was one of the followers of De Valera, and who carried on for a time De Valera's propaganda in the United States on behalf of the so-called "Irish Republic." He became a public nuisance here by his fanatical

appeal to the hatred of Irish-Americans for the British. Now if he dies, he dies wounded, not by an English soldier, but by some Irishman whose patriotism is as unquestioned as his own, and is, besides, mingled with common sense.

It is perhaps fortunate for Ireland that this civil war has occurred. When Ireland settles down to order and progress, if she ever does, it may be just as well that the people of southern Ireland should remember, not merely the contests which they have had with the English and with the people of Ulster, but also the contests that they have had among themselves. The memory of the fighting that is going on now may enable them to think of London and Belfast with less prejudice and animosity and to make them realize that for their unhappy condition the English are not the only ones to blame. This civil war, too, may enable them to understand the price of liberty. Every generation has to learn the lesson over again, and apparently repeatedly, and then does not learn it very well, that liberty is not obtained merely by lifting the hand of the oppressor.

EXPLAINING THE HAGUE

THE Conference at The Hague concerning Russian affairs having proved as futile as it promised to be, the British Government has been explaining the failure.

At Genoa, as well as at The Hague, Lloyd George advocated a policy which seemed to condone bad faith with the hope of getting trade. In his words there seemed to be a lack of keen realization of the fact that not even business can be carried on with people whose word is worthless. So Great Britain's attitude could be summed up in a phrase—Let's forgive, forget, and do business. The French, having other ideas on the subject, were treated as obstructionists. Now it turns out that the French were right. Sir Philip Lloyd-Greame, head of the British delegation at The Hague, has in a speech in the House of Commons interpreted the result of these conferences as progress in the education of Russia. He said that the Hague Conference had "brought Russia face to face with actualities as never before." Mr. Lloyd George indorsed Sir Philip Lloyd-Greame's words and said that the greatest advantage from Genoa and The Hague had been the education of Russia in actualities. Some of the delegates to The Hague and to Genoa may find it amusing to note Lloyd George as a teacher on a subject of which he so lately was a pupil.

Every development in this politico-economic game in Europe helps to show how wise our Government was in not becoming a party to the Conference at Genoa.

THE STATUS OF THE SHIP SUBSIDY BILL

ARE the majority of the people of the United States in favor of an American merchant marine? That is the question to which the members of the House of Representatives are supposed to have discovered the answer before they returned to Washington on August 15. When they left on their recess in the early part of July, it was with the understanding that they would sound out the sentiments of their constituents on this subject, while at the same time they were urged by President Harding to direct attention to the importance of passing promptly the Ship Subsidy Bill, so that this country might be in position to compete commercially with the rest of the world.

While proponents of the Ship Subsidy Bill are desirous of seeing the measure which has been introduced in both houses taken up and acted on at the present session, there is much doubt in many quarters as to whether it will be possible, with the other legislation Congress is expected to dispose of before it adjourns, to secure the passage of what is rightly known as the Merchant Marine Bill.

In addition to the numerous political elements which are involved in this question, a new factor has been injected which has added seriously to the complications and which cannot avoid being given consideration. This is the problem as to whether the sale of liquor is to be permitted beyond the three-mile limit on vessels flying the American flag and enjoying the benefits which they will derive from Government aid. While it is declared that the prohibition matter is only a side issue as compared with the broad general aspects of the merchant marine question, it is admitted even by those who are most strongly in favor of prompt action that there will inevitably be much debate on this point when the proposed bill comes up for consideration. Many members who have declared themselves in favor of legislation which will permit the upbuilding of an American merchant marine worthy of the commercial prowess of the United States, and at the same time lift the incubus of a \$50,000,000 annual expense of Government Shipping Board operation from the shoulders of the country, will find themselves embarrassed—in fact, unable consistently to vote for a measure which will sanction the sale of intoxicants on property over which the Government maintains even partial control.

While the prohibition feature of the Ship Subsidy Bill, therefore, is only one small portion of a big measure, it looms large as one of vital importance because of its great political significance. There

is a growing sentiment, therefore, that it will be extremely difficult to push the bill through to a vote, even if it should be taken up for debate by the House, before the fall elections. Members who voted for prohibition recognize that there is only one thing they can do—namely, vote for prohibition at sea as they voted for it ashore.

If the Merchant Marine or Subsidy Bill goes over to the short session which opens in December, it looks as if it would be necessary for President Harding to call a special session after March 4 next if he wishes to push through the merchant marine legislation to which he is so strongly committed.

PUBLIC OFFICE AND PRIVATE SACRIFICE

WHEN a governor is indicted or a scandal develops in a political organization, it is always regarded as front-page news. It attracts a hundred times the attention of such an act as that of Governor Miller, of New York State. He was recently attacked by the Secretary of the New York State Association, Mr. Robert Moses, because, he alleged, the executive department at Albany did not live up to the requirements of law in the matter of expenses. Governor Miller, who has made a very successful effort to cut down the expenses of the State Government, in reply to these criticisms, disclosed a situation which has proved a boomerang to the critics of the Government:

It is true that my former secretary did incur bills for certain purposes in excess of the appropriations for those purposes. Some of them he had paid himself, and when it was brought to my attention I refunded to him what he had paid and paid the balance myself. It is true that at that time the appropriations for these particular purposes were exhausted, and there was no appropriation for similar expenses for the balance of the fiscal year. The Legislature was then in session. I could have asked for a deficiency appropriation. . . . Now I didn't ask for a deficiency appropriation. I did pay the balance of the bills for the balance of the fiscal year myself rather than to do so. I did that because I had set my face against deficiency appropriations, and I had to observe the rule that I had established if I expected others to do so.

The Governor, rather than stretch the rule which he has laid down for other departments of the State Government, paid into the treasury of the State \$8,000. The Governor's salary is \$10,000. For Governor Miller, who has devoted a large part of his life to public service, such a financial sacrifice is indeed large.

We do not believe that many people realize how frequently public officials do sacrifice their own interests for the good of the Government. We suspect that the

list of Washington officials who make heavy financial sacrifices to further the Government's interests is longer than any one would suppose.

The Outlook is no Pollyanna, but it wishes that the day would come when newspapers would see the news value of work well done. If virtue were only as interesting to the average reporter as vice, we might not worry so much about the growth of crime waves and the prevalence of official corruption.

A LIGHT-BEARING MEMORIAL

MR. WILLIAM PULLIAM has already contributed much to building up friendly relations between the countries of Pan-America. His service as Receiver of Dominican Customs under both Presidents Roosevelt and Harding affords an example of effective international trusteeship of the most valuable character. International faith can only be built up by such faithful acts. Without them words of friendship are vapor.

Now Mr. Pulliam has put forward a plan for Pan-American co-operation in a project of more than sentimental interest to all the inhabitants of both South and North America. He has proposed that a lighthouse built from funds collected from our two continents shall be erected as a memorial to Columbus at Santo Domingo.

There has never been a Pan-American

memorial to Columbus in which the various peoples of the Pan-American Union have participated.

Santo Domingo is the oldest permanent Christian settlement in the New World; it is the only place in America where Columbus maintained a residence. It was the scene of his brief power and control, and also the place of his deepest humiliation—where he was stripped of that power, put in chains, and sent back to Spain. It is the place where he himself requested that his remains lie. The Spaniards appropriately and very affectionately referred to Santo Domingo as the "cradle of America;" hence it would seem to be the logical place for such a memorial, particularly if it takes a practical form.

Italy, the birthplace of Columbus, has practically recognized the authenticity of the remains unearthed in the Santo Domingo Cathedral on September 10, 1877, for in the Town Hall at Genoa, in a crystal urn, is exhibited a portion of the remains obtained in Santo Domingo at the time mentioned.

This project for a memorial lighthouse to the great Genoese navigator seems to combine sentiment and utility in a degree seldom found. It deserves a most general support.

CUTTING DOWN ARMY OFFICERS

THE task of reducing the commissioned personnel of the United States Army is now under way. A large cut, approximately one-sixth of the present list of officers affected, must be made before the end of the present calendar year, in accordance with an act of Congress—the Regular Army Appropriation Bill—approved June 30 last.

A board of army officers, headed by Major-General Joseph T. Dickman, retired, who rendered distinguished service in France during the war in command of the Third Division, has been appointed to perform the weeding-out process. The Board held its initial meeting on July 24, and is expected to complete its task by December 15, two weeks before the time within which the work of elimination must be completed.

As of June 30, the excess in the number of officers in various grades from first lieutenant to colonel totaled 2,149, while in the medical department and chaplains there were 367. While it is not possible now to state the exact number of officers who will actually be eliminated as a result of final selection by the Board, because of the fact that during the interim a number of officers will retire or be discharged voluntarily, nevertheless the Elimination Board will be compelled to recommend the dropping

(C) Paul Thompson

Who has been forced to reveal the use of his private funds for public purposes

(C) Harris & Ewing

THE PLUCKING BOARD

This is the name given to the board of general officers appointed to carry out the law for reducing the number of officers in the Regular Army. Members of the Board around the table are, from left to right: Brigadier-General A. W. Brewster; Major-General M. W. Ireland, surgeon-general; Major-General Joseph T. Dickman, retired, chairman; Major-General Henry P. McCain, former adjutant; Brigadier-General Ernest Hinds; and Major R. A. Jones, secretary

of considerably more than one thousand officers. Their task is lightened to some extent by the fact that the law allows eight hundred promotion-list officers in grades from colonel to first lieutenant, inclusive, to be held for absorption or recommissioned in the next lower grade. No such allowance, however, is made for the medical department and chaplains, and all of the excess there must be removed by separation from the active list, including that due to normal losses.

In connection with this drastic cut which has been ordered by Congress there is much discussion in army circles as to the effect it will have on the morale of the force and on its general efficiency and preparedness in case it is called on again to render active war service. Promotions, it is pointed out, will be much slower, officers being retained in the lower grades many more years than at present, so that if suddenly called on to assume greater duties they will be lacking in the required experience. This situation in the Army, it is claimed, cost many extra millions of money and months of time in preparedness of the American Army for the World War.

The selections for retirement and discharge will be based on the official records of officers, supplemented by such additional recommendations and reports as may be received. In the process of making the large reduction required, "officers must necessarily be retired or discharged whose active service would otherwise be continued," says a War Department circular giving the regulations; and so, under the circumstances, these separations from the service will be "regarded as honorable in every way and will not be regarded as stigmatizing an officer or his record."

As there are more than 12,000 officers in the Army and the time within which

the Elimination Board must perform its labors is limited, it is assumed that it will have to depend to a considerable extent upon the recommendations from chiefs of the several army branches. The War Department recommends that officers who leave the active list of the Regular Army continue available for military service in emergency, and urges such officers to affiliate with the National Guard or to apply for appointment in the Officers' Reserve Corps.

A SUCCESSFUL MASSACRE

HERRIN, until lately obscure, has achieved infamy. That southern Illinois mining town has become known as the place where murder pays. Turks or Kurds who torture to death defenseless Armenians in order to rule the surviving population with a rod of terror can now enjoy the flattery of successful imitation in America. Perhaps Illinois will have added a word to the language. Nobody hereafter need mistake the meaning of the verb "to herrin."

It was on June 22 that a mob of strikers at Herrin murdered in cold blood a score or so of non-union miners. For fiendish cruelty that mob has had, according to unrefuted reports, few equals. The strikers in that mob were determined that nobody in that region should exercise the liberty of working while they exercised the liberty of refusing to work. So they proceeded to prove that any one who tried to work would be in peril of suffering, not merely death, but also agony. A strike is a form of war; but this was worse than war. The men whom the strikers killed with torture had surrendered. They were not the vanquished in an open

though unjustifiable fight; they were the victims of a worse than brutish crime.

And that crime, after more than six weeks, appears now to have been a complete success.

The issue raised at Herrin has nothing whatever to do with the merits of the strike. No matter what any American may think of the strikers' cause, he cannot, if he is an intelligent and decent citizen, be (to use William Allen White's phrase) "fifty per cent" for these strikers of Herrin; he must be a hundred per cent against them. There are means so evil that they can render any cause on behalf of which they are used wholly negligible, for they constitute in themselves an utterly evil cause.

Such a cause is that of deliberate, terrorizing, murderous torture of the defenseless. And it is that evil cause that has apparently triumphed at Herrin.

If free government is to endure, it must provide means, not merely of punishing those who commit such a massacre, but of preventing, by constituted authority, such a massacre from taking place.

Do the people of Illinois propose to do anything about it? If not, do the people of the United States?

This case is a test of the American system of government.

Ordinarily a crime of violence, according to the American theory, is the concern of the community in which it occurs. But when the whole community is so tainted with the crime that the individuals in the community by shielding the criminals—whether through sympathy or through fear—become accomplices shall justice go by default? If so, government itself to that degree abdicates and in its place arises anarchy.

The failure of the county authorities at Herrin, the failure of the State authorities in Illinois, to establish the reign of law is not merely the failure of a county or a State; it is the failure of the Nation. Where men can rule by massacre there is the end, not only of liberty, but of all that is worthy to be called government.

AN URBAN VIEW OF RURAL IDEALS

IT was a maxim of Joseph Pulitzer that no editorial writer was worth his salt who did not find something every morning in the newspapers that made him angry. If the editorial writers for any agricultural paper happened to let their eyes fall upon a recent editorial in the New York "Mail," we suspect that each and every one of them promptly qualified for their daily ration of sodium chloride.

As an example of urban misunder-

standing of rural problems we reprint this editorial here in full:

IS A FARM A FACTORY OR A HOME?

At Mr. Morgenthau's picnic former Secretary of Agriculture Houston denounced a "silly notion that we have not enough farmers." He said that "the Nation needs just as many farmers as can produce crops which they can sell to the Nation at a profit."

According to this theory a farmer is a manufacturer and a farm is a factory. Its object is to produce food and sell it at a profit. It would follow that the fewer farmers there are and the fewer crops they raise the higher the price and the more profitable the farm-factory to its owner.

This theory has been recently taught to the farmers. If it is accepted by the farmers, it is well now to consider what the results would be to the farmers themselves and to everybody else.

It would follow that when prices are low farmers would not produce. The next step would be for the farmers to organize and strike. Suppose that any year the farmers would decide that they would not produce more food than enough for themselves and their families to eat. What would become of the rest of us?

The traditionary American idea is that a farm is not a factory, but a home. The distinction between a farm and a factory should be clear. A factory is a place where a man goes to work. A farm is where he and his family go to live. A factory is where he spends a fixed number of hours every day. A farm is where he eats and sleeps as well as works.

From a factory a man gets the means to buy food and shelter and fuel. A farm should supply the farmer with all his shelter, the greater part of his food, and his fuel from the wood lot. It is possible for

a farm to supply practically all a man's material wants—shelter, an abundant diet, fuel, ice, and it is not so long since the farm supplied wool, spinning wheels and cloth, and hides for shoes.

Considered solely as a factory, a farmer is at a great disadvantage. He must pay the retail prices for everything that he buys, and he gets only the wholesale price for what he has to sell. If he is a milk farmer and does not raise his cow feed, he pays the retail price for feed and receives about a third of the retail price for the milk. If he is a fruit farmer, he pays the retail price for his fertilizers, his packages, his spraying machinery, and gets only a fraction of the price the consumer pays for his fruit.

If a farm is a factory, the next step will be to consolidate hundreds of farms and have them run like factories, with the farmers as the hired workmen.

We remember reading with silent applause ex-Senator Houston's statement when it was originally reported in the daily press. We see no reason to withdraw that applause because of the arguments of the New York "Mail." An overcrowded profession is not an efficient profession. A large class of hand-to-mouth farmers is no more to be regarded as desirable than a large class of hand-to-mouth lawyers, doctors, or editors.

It seems to us entirely unobjectionable to regard a farm as a food factory. We can see no danger in this to any of the rural ideals which should properly be associated with the farm as a home. We see nothing desirable in the state of affairs in which a man purchasing a farm buys himself only a permanent job.

In addition to a wage income the farmer certainly deserves an income on his investment. If the editor of the "Mail" would apply the same argument to his own business, he would possibly see its weakness at once. There is no reason why the farmer should forego a profit on his investment for the benefit of the newspaper man than that the newspaper man should forego the profit on his investment for the benefit of the farmer. The editor of the "Mail" wonders "what would become of us" if our farms should be turned into factories. Possibly if the consequences imagined by the editor of the "Mail" actually occurred the city man might begin to take a real interest in the problem of marketing farm products. The suburbanite might be willing to take a few days off to study the problem of getting in direct touch with the farmer, thereby avoiding the shipments of farm products from rural communities to big cities, and then back again to the same rural communities.

We shall not attempt to answer fully the apparent theory of the "Mail" that the farmer should be given food, drink, clothing, and shelter, and then that the income of his labor should apparently accrue to the benefit of the city dweller. Nor shall we attempt to unravel the system of economics in which it is apparently claimed that the food which the farmer raises for his cattle costs him little or nothing. We shall merely speculate as to the length of time the theories of the "Mail" would endure if their creator could be put in the midst of a July hay field or set to milk a score of cows.

EMERGENCY CONTROL OF COAL

SPECIAL CORRESPONDENCE FROM WASHINGTON

BY WILLIAM P. HELM, JR.

COAL cannot be mined by proclamation; nor can miners and operators, it seems, be coaxed or shamed into performing their duty to the public, even by the President of the United States. Under existing laws, the Government is powerless to force unwilling workmen to work or unwilling employers to negotiate. For all its sovereign authority, it cannot compel a free man to place a pound of coal upon a railway car. As the laws of the country stand to-day, the miner is within his legal rights in refusing to work and the operator is within his legal rights in refusing to negotiate.

The rest of us may be forced into idleness, or close down our mills and factories, or see our personal hopes and savings curl up to the sky in smoke, or face the suffering of a coalless winter.

It is all perfectly regular and legal. If we freeze or starve, we may have the dying satisfaction of knowing that, like hanging, our death is brought about in a manner so entirely justified by present laws that no possible objection can lie against it. The miner is within his rights, the operator is within his, and we are within ours; and the Government can search through all the law libraries in the land without finding anything whatever to the contrary.

The Government cannot compel coal production, but there are some things it can do with respect to such coal as is now being produced, and those things are second in importance only to the actual mining of coal.

It can stay the hand of the profiteer from the insufficient production now being brought up from the mines.

It can check the cunning of the coal hoarder.

It can place at the disposal of producing mines the full measure of facility for accomplishing their maximum effort.

It can take the coal, when mined, and distribute it equitably in the public service, so that all may share, in proportion to their needs, in the available supply.

Those things the Government can do. Fortunately, there is a single agency, which the Government may control, capable of being used to work the Government's will. That is the agency of transportation, or, in other words, the railways, for the coal mines are utterly dependent upon cars to haul away coal as it is mined. The Government, by taking over all coal at the mouth of the mine, may send that coal where it wishes; and by supplying producing

mines with a full supply of empty cars may increase output to the highest possible amount.

It would seem that, with adequate transportation facilities, the non-union soft-coal mines might be placed on a double-shift basis of operation; but this plan either has not been considered or presents such physical difficulties as to make its adoption impracticable. Could it be done, however, and the present output doubled, the strike would end within fewer weeks than there are fingers on one hand, for the non-union mines have been producing until quite recently more than half of the Nation's requirements. If, by a makeshift, they could produce the entire requirements for a limited period, recalcitrant soft-coal operators and miners alike in other fields would quickly sue for peace.

That, however, is a digression. To revert to what the Government can do is another way of saying what the Government is doing.

Service Orders No. 22 and 23, issued by the Inter-State Commerce Commission July 25, are designed to accomplish all the Government can accomplish, through control of transportation, in softening the deadly blow of the strike and in sending available supplies of coal where they are most urgently needed and will perform the greatest service to the greatest number.

The first of those orders suspends for an indefinite period the right of the shipper to route his shipments, of whatever commodity, over favored roads or carriers, and directs that every pound of freight, from small package to complete car-load, be sent to its destination by the shortest and most expeditious route.

The second order establishes preferred lists of firms and individuals to whose consignments the railways are required to attend before handling shipments to any other firms or individuals. In the order named below these firms and individuals are the consignees of:

- Food for human consumption.
- Feed for live stock.
- Live stock.
- Perishable products.
- Coal, coke, and fuel oil.

Precedent for the establishment of such an order was created by the Railroads War Board in the closing months of 1917, just before the Government took over the carriers. Priority shipments did not work out well in those days of blizzards and congestion; but the principle was sound, and when Congress came to enact the Transportation Law it placed the power to declare priorities in the hands of the Inter-State Commerce Commission. It was a wise foresight that impelled inclusion of that provision, though it is doubtful if the framers of the law anticipated the industrial crisis of 1922 or anything approximating it.

These great powers, including power to suspend ordinary rulings and practices, were granted to the Commission for use only in emergency. In exercising

ing them, the Commission states in its formal order, "an emergency which requires immediate action exists upon the lines of each and all the common carriers by railroad . . . east of the Mississippi River." After prescribing the five priorities named above, the Commission orders all roads within that territory to give their next best effort to the return of empty cars for reloading the commodities named.

Every coal-carrying railway is ordered "to furnish coal mines with open-top cars suitable for the transportation of coal in preference to any other use . . . of such cars." Connecting railways upon whose lines there are no coal mines are required to furnish the coal carriers with empty coal cars to "the maximum ability to make such deliveries." The coal carriers are further and specifically authorized and directed to throw the entire amount of their open-top equipment into the coal trade, to the exclusion of all other classes of freight, if necessary.

Coming to consignees, the Commission directs the railways to refuse to accept coal for any firm or individual who during the emergency fails to unload such shipments within twenty-four hours after receiving them. That is to insure a quick return of empty cars to the mines. And then the Commission names five classes of coal consumers who shall be preferred above all others.

The first class on the list is left open, subject to direct order of the Commission. Apparently this highest of priority orders is to be held in reserve to meet individual cases of railways and public utility plants in such desperate straits that only immediate help can avert a shut-down.

The second class is divided into three sections:

First is fuel for railways. At the present time the railways are consuming from 2,500,000 to 3,000,000 tons of coal a week. If they get their full requirements, at the present rate of activity (which, of course will lessen with curtailment of industry), the railways alone

would take from five-eighths to three-fourths of all the non-union coal mined.

Next (after a relatively small amount of coal for bunkering vessels) is placed the public utility group, consisting of power companies, electric railway and light companies, gas companies, water and sewer works, ice plants, and hospitals. This group alone, at normal rates of consumption, would take virtually all the non-union coal mined after the railways had been supplied.

Third come the Federal, State, and municipal governments and their institutions—the Army, Navy, public buildings, schools, hospitals, etc. There won't be enough coal to supply the needs of this group in full.

In Class No. 3 the Commission placed the Northwest alone. That section is short now about 10,000,000 tons. In other words, it is that much short of its last year's loadings up to this time. There will not be much coal for this classification if all the other classifications exercise their rights to the full. However, some of the railways and some of the public utilities already have fair-sized individual stocks, so there probably will be some coal left for the Northwest. Not much, however.

The fourth class contains the average man who puts his soft coal in his cellar in normal times and uses it for the furnace. It is not hard to calculate where he stands. He gets no coal—or virtually none. The order undoubtedly will be changed to help the householder if the strike continues. At the present time, however, the householder is busy handling ice and doesn't need coal for immediate use. Besides, about ninety per cent of the householders, it is estimated, have a little coal in the cellar and could get along for a week or two after cold weather comes.

And, as it is obviously unwise in this emergency to have consumers stocking coal now three or four months in advance of its use, the Government is not trying at present to put coal into private cellars. There is time enough for that, and that will certainly be taken care of in time.

Class Five, last of the lot, takes care of all other consumers. That is where the factory or mill owner comes in. He will go out as he comes in, too, during the remainder of the strike—without coal. Not that the Government does not want him to have coal, but that there is not enough for everybody, and the Government figures that the railways, the public utilities, and so on, have the more urgent need and should be supplied first.

In addition to the Commission orders, a Presidential Committee is functioning. That Committee, through control of cars, can absolutely throttle profiteering and prevent hoarding.

Thus comes a coal rationing programme in midsummer. It is with us now, and will be for a time. The snow will lie deep upon the ground before

those orders are lifted. Winter will come and pass and spring will come again, and probably find us still upon a ration of coal. The months will surely

lengthen to a year before we know the end of the coal calamity of 1922; and unless mining is speedily renewed New Year's Day of 1924 will find us still

reaping our sorry harvest from the seeds of indifference we have been sowing in the spring and early summer of the present year.

FROM A MINER'S POINT OF VIEW

BY FRANCIS PRIDEMORE

A LARGE number of kind and worthy people who are obliged to form their opinions about the rights and wrongs of this strike from the newspapers are inclined to think that the miners' attitude towards the operators is the attitude of spoiled children towards their parents. They regard our refusal to go back to work as ungrateful. In this article I want, if I can, to make people understand why we miners cannot help feeling strongly, even bitterly, against the operators; and why, even although we individually may by no means uphold all the union does nor whole-heartedly indorse its methods, yet in such crises as this we are almost universally loyal.

I was thirteen years old when I first started to work in the coal mines. The mere fact that I was allowed to work without being asked any questions about my age shows that the field was non-union. I started in as a trapper. My job consisted in sitting on a stool behind the trap-door between the track and the coal. Here I sat until I heard the cars coming, when I got up and opened the door to let the driver through and shut it behind him. Then I sat down again until I heard him whistle as he returned with the empties, when I repeated the performance. The length of my day was eight hours, and I received \$2.25. The work, though very monotonous, was not too difficult for a boy, nor were the hours too long, though they seemed to drag out endlessly as I sat in the dim flare of an oil light. The chief trouble was the danger. One day in March, after I had been working there for some months, three three-ton cars ran through the trap-door, knocked me across the track and broke my leg. It was seven months before I was able to work again.

When I recovered, I did not go back to trapping. I was given a job driving a mule for \$4.25 a day. This work was easier and more interesting than trapping, nor was it so dangerous. I worked at this for six months, and then I started in as a full-fledged loader with my elder brother. Thus began my mining career. This was in West Virginia, near Logan, which has recently been so prominent for trouble over organization. Since then I have mined in union and non-union fields in Virginia, West Virginia, and Kentucky, and in union fields in Ohio and in the anthracite regions in Pennsylvania.

In all my thirteen years' experience in the various districts I have worked in only two fields where I felt that the operators were giving their men a

square deal—where they seemed to regard us as human beings, and not as rather cheap machinery. Both of these are union fields. The first is near Russell Creek, in Virginia, and the sec-

would have brought about the existing improvement in wages, working conditions, and hours.

But the question of wages is far too involved to be discussed in an article as

P & A Photos

PENNSYLVANIA TROOPS MOVING INTO THE ANTHRACITE MINE AREA

"I asked," says President Harding in his letter on the strikes, "the Governors of the coal-mining States to invite mine operators and mine workers to resume their activities, and to promise that to which every man is entitled, namely, protection in his lawful pursuits"

ond is in the hard-coal district near Wilkes-Barre. In these two fields there is excellent co-operation between the operators and the union, which goes to prove that organization does not mean increased friction between men and company unless the company is deliberately exploiting the men.

The first cause of bitterness is of course the question of wages. I am aware that few people will believe me when I assert that we would be willing to work for smaller wages if we did not feel that the operators' one aim is to pay as little as possible while getting as much work out of us as possible, but such is the case. Against this attitude on the part of the operators the union is our only defense. I hold no brief for the union. It is far from perfect and it has numerous traitors and fools among its ranks, but, faulty as it is, it has been a power for good. I am perfectly willing to admit that there are good operators as well as bad, but not even the most sanguine of their upholders will maintain that they, of their own free will,

short as this, so I will pass on to the next source of bitterness on our side—the company store. This exists in union and non-union fields alike. In theory the company store is an excellent thing, and occasionally, where practice does not depart too widely from theory, it may not be bad in the working out, but as a general thing the company store is an unmitigated curse. I have never been in a company store which did not charge very high prices for a very poor quality of goods. When you pay \$3.50 for a twenty-four-pound sack of flour which you afterwards discover was billed to the store at \$1.50, you naturally feel that the company is trimming you at both ends. In some fields you are almost compelled to trade at the company store, and in others it is merely urged upon you by various means. The general idea is to get you into the company debt and then see that you stay there. Receipts are not given in company stores, and unless you are very careful you will be charged twice for the same thing; sometimes even for

a bill you have already paid. Inasmuch as many of us are extremely ignorant, it is exceedingly difficult for us to avoid getting cheated. The result is a sort of slavery.

The company always likes to hire men with families, since it is easier both to get them in debt and to keep them when they are there. A man with a family cannot skip out as can a man whose home is wherever he happens to hang his hat. I cannot describe the heart-breaking discouragement of the lives of those who are once fairly in the clutches of the company-store system. What wonder that they lose interest in their

it means, for I have been there. Is it any wonder that we are bitter against the representatives of a system that permits such a thing?

But far, far worse than the company stores in the non-union fields is the mine guard system. A good deal has been written about this system, but more has been suppressed, and the public does not know how bad it is. The most flagrant example of this abuse that has come within my own personal experience is in West Virginia. To begin with, county officials are greatly influenced by the coal companies. To those of us who really know the facts

and order. The same holds true of so-called detectives who are hired as mine guards and sworn in as deputy sheriffs. Many of these men are nothing more or less than professional gunmen of exactly the same type as those who were recently discovered to make a practice of killing men at \$100 the murder.

It is of course to the interest of these men to prolong any trouble to the utmost extent, for the longer the trouble lasts, the longer their jobs last. They are too skillful to be open aggressors, but in nine cases out of ten where trouble has arisen between strikers and guards the strikers have been harassed almost beyond the point of endurance. The guards act more like soldiers in a conquered country than upholders of freedom. They turn the coal towns into armed camps. The men cannot go in or out without passes. Even the women are not allowed to enter or leave the camps. As for the unfortunate strike-breakers, who are too often enticed into the camps under false pretenses, from the moment they enter the town they are no longer free agents. The guards, ostensibly protecting them, do not permit them to hold any converse with any outsider, nor are they allowed to leave the barracks or whatever company shelter they may have. Nor is it safe for them to refuse to work when they find that they have been deceived. If they do, they are forced to work by curses and threats that worse things will befall them. If they still prove obdurate, they learn that the threats were not empty.

I wonder how many people will believe that what I have written above is the exact truth? I am afraid not many of those who have never lived in a coal region. But there is no miner in West Virginia who does not know these things to be absolutely true. How, then, shall we not feel bitterness towards the operators who have made such things possible? How shall we not be loyal to the union which, though far from perfect, is our only defender?

"No one," says President Harding in his letter on the strikes, "has suggested coercion under military force. The military forces of free America are never used for such a purpose. Their service is only that of preventing lawlessness and violence"

work! Every penny that their hard work brings them must go to paying off the debt which, in spite of their effort, seems merely to increase. I know what

in the case and are acquainted with some of the officials and their record it is enough to make one turn Bolshevik to read of them as the defenders of law

ANOTHER POINT OF VIEW IN THE MINING REGION

BY A. S. RACHAL

I NOTE in a recent issue of your magazine an article setting forth that the union miners are striking simply to secure a living wage. May I present an incident that occurred here under my personal supervision, so to speak?

Recently we saw a handsome Victrola being hauled up the hill beyond our house. My wife asked the young colored woman who was cleaning for us about this, and received the answer that it was hers. A Negro neighbor, a miner, had bought a Victrola and one hundred records for \$175 a few weeks before, soon tired of it, concluded to buy a piano, and sold the Victrola to another

miner (the husband of the young colored woman just mentioned) for \$125, and bought the piano.

These are non-union miners. They get the same wages the union miners do, subject to the advantage of no dues to pay. They are busy at work, contented, able to buy pianos and Victrolas, and records by the hundred. Their wages allow them to live in complete comfort. This is no isolated instance. Perhaps the majority of the miners own either a Victrola, a piano, or a player-piano. Certainly a large percentage.

I am a Presbyterian minister. I own not one dollar of coal stock. I number among my clientele operators in one

place, miners in another. My salary is less than expert miners receive. I live on it, and make no offer to strike.

The sole cause of the wholesale disturbance, in this State at least, lies in the effort to unionize the non-union fields—to enforce the closed shop. The non-union miners are working in peace. Only the union miners are discontented. The same wages are offered to them that the others receive. They demand something else than a certain wage.

The question of the closed shop I shall not attempt to adjudicate. But that is the trouble, and the whole trouble in southern West Virginia.

Bramwell, West Virginia.

CANVAS AND CULTURE

WHEN CHAUTAUQUA COMES TO TOWN

BY EDNA ERLE WILSON

EVERY year some time during the summer months a train unloads a big roll of canvas and a group of strangers in the busy town of Harrodsburg, Kentucky. The next day the horses that pull the delivery wagons are arrayed in chorus-girl skirts placarded with startling signs. Automobiles gliding up and down Main Street trail pennants in the sunshine like gaudy fluttering butterflies. The Zinzendorf, the city's biggest hotel, is crowded from garret to cellar with visitors wearing their holiday clothes and an expectant expression. And overnight a brown tent rises on a vacant lot like a gigantic rounded caramel. The annual Chautauqua has come to town.

For months the whole population has been looking forward to music, lectures, and the neighborliness that it offers. Twice daily in the coming week the big tent will be filled to bench-creaking capacity with an audience eager to be amused, informed, and roused out of the apathy of a humdrum workaday world. For this is what Chautauqua does for the ten thousand towns that mark its ever-widening course over the country's map. This tent-and-talent small-town combination is as successful an answer to the need for amusement as the famed Great White Way.

In fact, the Chautauqua of Harrodsburg supplies a very much more convincing answer to the question of what the average citizen likes in the way of amusement than Broadway's most successful musical comedy. To the pessimist who gloomily proclaims that the American public spends its leisure time

in breaking the Eighteenth Amendment, listening to the caterwaulings of the jazzists, and pursuing a giddy whirl of pleasures the lengthening trail of the Chautauqua brings a message of cheer.

Mr. George M. Cohan knows what a New York audience likes in its hours off. So does the manager of Steeplechase Park. But the crowds that fill the theaters around Forty-second Street or that flock to Coney Island on a sultry July Sunday are not typical American audiences. And Mr. Moreland Brown, of the White and Myers Chautauquas, with circuits visiting four hundred towns in fourteen States, has a clearer insight into the amusement tastes of the American citizen as he exists in his native habitat than any Broadway manager alive.

When Chautauqua comes to town, it means entertainment for the whole family and the entire community. The audiences run the scale from youth to old age, from the poor to the wealthy, from the cultivated to those of scanty schooling. There are men bearing the mark of the farm, and beside them women holding babies in their arms. There are visitors from the nearest city, with automobiles waiting outside.

To meet the need of just this type of audience, the plain people whom Abraham Lincoln loved, the Chautauqua, a word, and idea of purely American origin, was born. It grew up in the West, away from the bustle and roar of the city, and is just as typical of our country as apple pie or baseball, and, although the enterprise has expanded from a small beginning to flourishing

proportions, it has never departed from the ideal of its conception. Chautauqua means music and laughter, relaxation and stimulation. It is fun for the whole community, but the fun is sketched in against a cultural background.

That is the type of amusement that the real American audience demands, and that is why Chautauqua has become a household word and a National institution. That is why a small town of five hundred inhabitants will gather together as many as five thousand people for the event. And that is why the town of Picture Rocks, Pennsylvania, with a population of seven hundred, spends two thousand dollars for Chautauqua. When it comes to town, the manufacturing plants close for the week, paying their employees full wages. It is estimated that ninety per cent of the people of this community hold season tickets.

In providing the best type of entertainment Chautauqua has discouraged lower forms of amusement. Discussing this holiday week as one of the most vigorous forces for the advancement of recreational ideals, Mr. Keith Vawter, of the Redpath Bureau in Cedar Rapids, Iowa, said: "The old-time medicine show is gone and the worst of the street carnivals are nearly gone, not because of any tirade or campaign against them, but because the Chautauqua has led the people away from such coarse horse-play."

Not only has the Chautauqua led the people away from the old-time rough-and-tumble carnival, but it has led them to an appreciation of the finest things in the great world of art, science, politics, and letters. For two dollars invested in a ticket Harrodsburg citizens may hear an eminent orator or statesman, a clever impersonator, or a musician of real artistic merit. The programmes under the brown tents are a quaint mixture of canvas and culture.

Next to the phonograph the Chautauqua is the greatest distributor of music in the land. The numbers that win applause from the audiences at these gatherings are not of the vulgar, insinuating type labeled as "popular." The people who have responded to the harmony of Rossini's "William Tell," Tschalkowsky's "Sleeping Beauty Waltz," or the aria from Puccini's "Butterfly" no longer accept the cheap music styles set them by theaters and cabarets. They have acquired a standard of their own and a measure of comparison.

One of the strongest points in the junior programme of the White and Myers Chautauquas, according to its president, Mr. J. Shannon White, is the teaching of an appreciation of music.

"We try to lay the foundation of real musical appreciation in the minds of our

STORY-TELLING HOUR DRAWS YOUTHFUL CHAUTAUQUANS INTO A CIRCLE OF CHARMED LISTENERS

Community Service

A COMMUNITY SING AT TWILIGHT IS AN IMPORTANT AND IMPRESSIVE ITEM UPON MANY CHAUTAUQUA PROGRAMMES

young patrons," he said. "Every morning they gather together and listen to various selections, which they are asked to explain in their own words. Folk songs are often given. Once the children have perceived the quality of the music of the various nationalities, the next step is to translate this sense of rhythm into the graceful measures of folk dances."

Young America likes this part of the programme, and carries home its new accomplishment for the benefit of the older generation. The Chautauqua audience is composed of stay-at-home people, and the entertainment that they enjoy during the gay week when the brown tent is planted in town furnishes them with food for thought and conversation and recreation during the other fifty-one weeks of the year. That music exists in most of these homes was revealed by a survey recently made by the University of Wisconsin, showing that it is a common recreation in fifty-one per cent of country homes and forty-three per cent of village homes. So the Chautauqua by familiarizing its patrons with the non-jazz variety is doing much to lift the standard of this form of entertainment in American households.

But, while music is a very necessary and vital part of a Chautauqua programme, the lecturer has always been the real meat. Not only will the audience stand for a lecture, figuratively speaking, but also literally—two hours in the rain! The forerunner of the present-day headliners was no less a per-

son than Ralph Waldo Emerson, who in 1868 mounted to the lecture platform and exchanged his fame for the currency of the realm. Since that time prominent statesmen, noted men of affairs, ministers, authors, and university presidents have furnished constructive entertainment at Chautauquas, being classified as "talent" along with the Swiss bell-ringers and the opera singers. That they share places on the programme alongside professional entertainers is a demonstration of the real democracy of the occasion. President Warren G. Harding is Honorary President of the International Lyceum and Chautauqua Association. He was a former lecturer and was secretary of the Marion, Ohio, Chautauqua for many years. William Jennings Bryan has long been a scintillating star in the Chautauqua sky. Ex-President William Howard Taft, ex-Vice-President Thomas R. Marshall, Bishop Mitchell, and Frank Mulholland are also well-known names.

Some of the more popular lecturers upon Chautauqua circuits give the same talk as often as five thousand times, a run which a Broadway manager might envy. Talks on civic beauty or sanitation often bring these matters to local attention for the first time. The community expert wakes up many sleepy towns. Long after the Chautauqua tent has been taken down the newly awakened community spirit remains. All up and down Main Street there is an added warmth in the greetings exchanged between the passers-by, in the chatter

across the counter in the stores and shops, and in the stimulated civic pride that expresses itself in a cleaner thoroughfare than of old or a new playground for its future citizens.

Perhaps this last innovation may be traced directly to the success of the junior programme, for the children of the community are not forgotten in this week of entertainment. A miniature tent serves to dramatize to the childish imagination that they are really having a Chautauqua of their own. Boy Scouts are on hand to help put it up and distribute the printed programmes. Folk games, special parties, play days, storytelling hours, and walks in the woods for nature study bring magic to the hours. Every evening the youthful Chautauquans give a play stunt in front of the big tent, with interested fathers and mothers for spectators. And on the last night there is either a colorful pageant or a juvenile interpretation of "A Midsummer-Night's Dream" as a grand finale.

That this gala week of entertainment exerts a marked and beneficial effect upon the children of a community, not only in their recreation but in their studies as well, was demonstrated by an incident which occurred in a small town below the Mason and Dixon Line which failed to raise its Chautauqua collection along with its cotton crop. When it seemed probable that Chautauqua wouldn't come to town as a result, a teacher in the public schools got the people together and told them in vigor-

ous phrases that Chautauqua meant as much to her pupils as a year in school.

"It has made geography a living thing," she said, "put flesh and blood on the dry bones of literature, instilled the breath of life into the waning spirit of good English, and originated a loyalty hitherto unknown."

The Chautauqua is one of the most potent single forces now at work for the advancement of National thought, National entertainment, and National ideals. The statistics compiled by Mr. C. F. Horner, of the Redpath-Horner Bureau in Kansas City, at the request of the International Lyceum and Chautauqua Association, tell a striking story. In 1921 almost ten thousand towns were visited by Chautauquas, with an attendance of over thirty-five million. The ninety-five programmes provided one hundred thousand hours of entertainment and music to a multitude which is

in reality about one-third of the population of the United States.

At its best, Chautauqua is a community, and not a commercial undertaking. The Ellison-White Lyceum and Chautauqua Bureau of Portland, Oregon, one of the largest single organizations of its kind in the United States, has placed its business upon a non-profit basis, so that the towns that support it share in the profits.

When this step was taken, Mr. Roy E. Ellison expressed himself as feeling that the Chautauqua was too big an institution to be operated for private profit.

"It has long been my dream to place it on a bigger, broader basis—one purely of service," he said. "I believe our organization has effected this. Now the Lyceum and the Chautauqua can take its place with the school, the college, and the church—an institution of the common people."

Viscount James Bryce, former Ambassador of Great Britain to the United States and author of "The American Commonwealth," once said, "I do not think any country in the world but America could produce such gatherings as Chautauquas."

Probably not. And yet other countries are rapidly falling into line and eagerly adopting this made-in-America product. It is being exported all over the globe. Our next-door neighbor Canada has taken them to her heart. Alaska is as numerically dotted with them as the trail of the Yukon was with gold-diggers' camps in '98. New Zealand patronizes them. England has established a circuit. And that progressive bit of the Orient, Japan, is carrying on a lively flirtation with the idea.

No enterprise ever reaches such gigantic proportions unless it fills an urgent human need.

CLOSING IN ON COMMERCIAL BRIBERY

BY WILLIAM R. SCOTT

BUSINESS ethics is on the up-grade in America despite the innumerable "investigations," as shown by the passage on June 1 by the House of Representatives of the Volstead bill against commercial bribery, by far the most drastic anti-bribery bill ever passed by any legislative assembly in the world.

If the Senate acts favorably upon the bill and it receives Executive approval, the use of money, gifts, and other considerations to influence the buying trade will be made punishable by a fine of \$3,000, or by two years in prison, or both, if the bribe is offered or accepted in inter-State commerce. Salesmanship will thereafter have to depend upon straight argument under keen competition, unless subterranean methods of circumventing the law should be devised.

The passage of the bill by the House represents the fruits of a campaign of many years, but intensively prosecuted only within the last four or five years. During the war the attention of the Federal Trade Commission was directed to the practice of bribery in business, and upon inquiry the practice was found to be distressingly widespread. Purchasing agents, or buyers, in many industries considered it a normal part of their incomes to receive secret commissions of five per cent or more upon all orders they placed, or to accept expensive gifts of jewelry, furniture, automobiles, or other things from salesmen eager to dispose of merchandise.

One concern was found by the Commission to have given \$1,400,000 in two years in what was classified by the Commission as bribes to buyers of its commodities. Foremen in paint and varnish shops were found whose incomes from secret commissions on paints and var-

nishes they recommended to their employers were doubled or trebled. In the shipping industry virtually every captain or other officer of the vessel who did the buying expected five per cent of the amount of the order to be paid to himself. That is to say, bribery was almost as commonplace in several industries as is tipping in hotels, and it was found to some extent in all industries investigated.

The Commission also found that the industries most honeycombed with the practice were most anxious to get it outlawed. Thus the paint and varnish industry was so much in earnest that it established an Unfair Competition Bureau in Washington, the business of which was to prevent bribery within the industry. Later on the shipping industry or the supply houses along the Gulf and South Atlantic seaboard opened a similar bureau. Former attorneys or investigators of the Federal Trade Commission were placed in charge.

By this time the movement against bribery was gaining momentum, which resulted in several bills being introduced in both houses of Congress, but they were crowded aside. By the spring of 1922, however, nearly forty trade associations had lined up against the practice, including the National Association of Purchasing Agents and the American Society of Sales Executives (or the buyer and seller), and when the bill finally reached the floor of the House the opposition had been so completely met that no vote was recorded against the proposed legislation.

Exemplifying the new ethical outlook in business is the organization early this year of the Commercial Standards Council, with headquarters at 19 Park Place, New York City. Among the or-

ganizations represented in this Council are the Associated Advertising Clubs of the World, the two associations of buyers and salesmen already mentioned, the paint and varnish Unfair Competition Bureau, the American Ship Service Corporation, the National Association of Credit Men, and other associations of equal weight. The object of the Council is "to develop the highest commercial standards and to eliminate harmful business practices." Its full support was given to the Anti-Bribery Bill.

One feature of the bill as passed by the House is believed by its proponents to insure the end of bribery, namely, a provision that the first party to a bribe who confesses may obtain immunity. As no grafter could be sure that the other party would "stand hitched," it is thought that the risk will automatically stop the practice. Other sections of the bill make the use of fraudulent documents to conceal a bribe illegal; deny the right to plead custom in defense of bribery; require a party to a bribe to testify about the transaction even if such testimony incriminates the witness, but the witness so testifying shall not be prosecuted on account of any transaction about which he may testify; declare that the finding of any section of the act is unconstitutional shall not invalidate the remainder of the act; prescribe the practice as an unfair method of competition, and so within the power of the Federal Trade Commission, as well as of the Department of Justice, to prosecute; and that nothing in the act shall repeal existing laws against corrupt practices.

Twenty-one of the States have specific statutes against bribery of one kind or another, while England, Germany, Sweden, Canada, Australia, New Zealand,

the Union of South Africa, and several smaller dependencies of the British Empire have laws restraining the practice. In England the Bribery and Secret

Commissions Prevention League has been in existence and actively aiding the enforcement of the Prevention of Corruption Act since 1908. The American

organization, the Commercial Standards Council, fully appreciates the fact that its chief work will come after a law is passed in seeing that it is enforced.

TEACH YOUR CHILD A TRADE

BY JAMES J. DAVIS

SECRETARY OF LABOR

IN the first book of the Bible is the law laid down, "I have learned by experience," and since that day mankind has acquired wisdom by daily toil. Not all the lore of libraries has contributed to mankind's advancement as much as has the instruction of experience. From the days when the Carpenter of Nazareth wrought with adze and hammer in the house of his foster-father man has been blessed in the work of his hands. Through the twenty centuries since that time the craftsman has fought his way steadily forward with the advance of civilization until to-day he may well be reckoned among the most powerful forces at work for human progress. Up through the ages, dark with a world's woe or bright with the rising sun of human betterment, he has struggled on his way to a place in the forefront of the onward-pressing army of humankind. The dignity of labor, for so long a mere empty phrase, has come to have real meaning. More and more we in America are coming to realize that we must change our attitude toward the occupation of the man who works with his hands.

Man must learn by doing fully as much as he must learn by thinking. Education to-day is a matter of the heart and the hand fully as much as it is a matter of the mind. For the whole purpose of education, in all the broadness of the term, is the making of the man or woman more useful to himself and to the world. Its aim and object is to make the individual better able to care for himself and provide for his own happiness, and to benefit society generally by enhancing the value of the individual as a social asset.

The last few generations have seen education taking vast strides forward in America. Within the memory of some of us still living education, outside of a few great scholastic centers in the eastern part of our country, was a matter of the three R's—Reading, 'Riting, and 'Rithmetic. A working acquaintance with these three, or even with the first two of them, entitled a man or woman to be called "educated" among a vast proportion of our population. The man who in those days, under the flickering light of a candle, could laboriously study out word after word or tediously scratch a few lines of more or less legible writing was looked upon as schooled. His acquaintance with literature, of the past or of his own time, was slight indeed. Sciences and the languages were to him a closed book.

To-day all this is changed. There are comparatively few of our vast millions who cannot read and write fluently, who cannot acquire the thoughts of others and present their own thoughts by means of the written or printed word. In nearly every American home the standard classic authors, particularly Shakespeare, are read and understood. Even the classics of other languages are known to and enjoyed by many.

But in accomplishing this tremendous stride forward in the education of our people we have fostered an educational fallacy—a fallacy as far-reaching in its evil consequences as any that ever took root in the minds of a whole people. We have allowed our people to look upon education as an end rather than as a means. We have allowed the conviction to grow among many of our younger citizens that education is a substitute for work, that education by and of itself should provide the means of life and happiness. We have permitted the growth of the conviction that an education unfits a man for work that must be done with his hands.

The advance of our educational system has been rapid, but it has been all in one direction. Our educators, striving after the literary ideal, have been imbued with the classical almost to the exclusion of the practical. We have designed a magnificently decorated set of educational harness, all a-jingle with silver bells, and have clamped it upon all and sundry, insisting that all follow the same road.

We have yoked together the boy whose sole ambition is to follow the footsteps of his father, who is a lawyer, and the girl whose only aspiration is to become as good a wife and home-maker as her mother. We prescribe the same educational burden for the youth who seeks to be a good steam-fitter and the boy who glimpses a vision of future success as an educator.

More than ninety per cent of our population is made up of the industrial worker and the farmer. Less than ten per cent of our people are in professional life. Yet practically our whole educational system is directed toward turning out boys and girls equipped to enter the professions, to undertake what is known as brain-work, or, more aptly, to occupy "white collar" jobs. Educating one hundred per cent of our school-children along lines that fit them for the professions is plainly unjustified when we know that less than ten per cent of them will be able to make a living in profes-

sional life. To-day, while our "white collar" occupations are crowded to overflowing, we are actually lacking in the skilled workmen and artisans necessary to keep up production in shop and factory and to do our structural work. Our educational system is out of balance.

We have gathered the fruits of this system, and they have turned to ashes on the lips. We see our future generations growing up with a profound distaste for manual labor. We see our young men and young women insisting that their education fits them only for so-called "mental" or brain effort. We find them seeking unremunerative employment in crowded offices, jeopardizing the Nation's health and building up an economic problem of serious proportions.

We have learned that, properly trained, the American as an artisan exceeds in efficiency the natives of all other nations. We must attract young America to the crafts where men work with their hands—the crafts upon which ultimately rest responsibility for the Nation's prosperity, economic and political. To that end we must see to it that educational conditions which induce the belief that work with the hands is irksome and menial are corrected.

We are spending in public funds about a billion dollars a year in education. Practically all of this is expended by our towns, counties, States, and the Nation in fostering institutions which give to the student academic or classical training. Very little, if any, is used to provide means of teaching the youth of the land to use their hands in useful endeavor. The time has come to put education on a sound basis, to end the monopoly which has been given to the instruction in theory alone in our schools. The term education is one of the broadest in our language; it covers a scope that is almost without limitation, but we have narrowed it to the point where its real meaning is often lost.

There is no straight and narrow path to education. There is no single road which can be marked, "This way, and this way alone, leads to learning." True education can be acquired in many ways, and the choice of these ways should lie with the individual and should be made to fit the individual. I remember as clearly as if it were yesterday the beginning of my real education. I had left school at the age of eleven, and I believed my opportunity for education was lost when I went to work in the mills, later to become a helper to my

father, who was a puddler of iron. As a puddler's helper the pig metal that came to the puddling furnace aroused my interest, and I asked where it came from. My father took me to the blast furnace and showed me the stocks of ore, and limestone, coal, and coke. Right there I learned a lesson in geology, geography, physics, and chemistry that started me on the right road. In the work that lay before me I had found the means to gain knowledge. Not knowledge of the work alone, but solid, practical knowledge of the great world that stretched out all around that work.

My father showed me how the raw material in the blast furnace was purged of dross and slag, and explained the casting of the iron. He explained the puddle furnace, where further impurities are removed from the metal. He pointed out the work of the finishing mills, the eight and twelve inch mills, the bar mill, the nail-plate mill, and the tank-plate and sheet mills. He pointed out the finished product and said:

"When you have learned exactly where ore comes from and why, and where it goes and why, you will have a real education."

So, in the words of the Scripture, I have learned by experience. I have found that the opportunities for education lie all around us in our daily life and our daily work. The girl in the country who must arise early in the morning to kindle the kitchen fire can acquire knowledge by studying the materials she uses. The study of the sources and uses of the wood and coal and oil that she puts into her stove will give her a start in geography, geology, mineralogy, and several other subjects. The

kindling of a breakfast fire may kindle a real desire for real knowledge.

This practical plan of education, under direction, offers a real solution of our educational problems. It will broaden the field of our schools to the limits of the wide meaning of the term education, and at the same time it will preserve the individuality of our students. It will take our educational system out of its strait-jacket and give it freedom to live and breathe and grow. I am no revolutionist in the field of education. I would not at once and without consideration abandon all that has been accomplished in the building up of our academic system. Rather I would preserve all that is good in our system, and link with the instruction in theory which we now offer instruction in actual practice. We have in America to-day the best educational system that has been evolved, but not the best that can be evolved. I would improve it, not destroy it. Our duty is to develop the best and most effective system for the instruction of our youth that American genius can devise. To do this we must realize the vital importance of offering to our rising generations the opportunity to learn with hand and heart as well as with brain. America must teach the trades—true craftsmanship—by practical instruction linked with instruction in theory. The youth who yearns to become a true artisan must not be yoked for years with the youth who is driving with might and main to become a physician. Our educational system must be balanced.

It was this thought that I had in mind when I joined a fraternal order, the Loyal Order of Moose. I was the 247th member, and I then visioned a great

service to the Nation which the order could render. The order now has 600,000 members, each of whom pays \$2 a year for the support of the home-school at Mooseheart for dependent orphans of the order, where 1,023 acres of land are dotted with buildings and equipment which represent \$5,000,000 in replacement value. Recently a woman's auxiliary has been organized, and 50,000 women are contributing \$1 a year to support the home-school. The organization is growing by leaps and bounds, and every member has a deep appreciation of the service he is rendering, not alone to the children themselves, but to society as a whole. It is a work that deserves the interest and support of all good men and women,—this task of equipping our rising generation to face the world unafraid and able to care for itself. I believe we have found the way to do it, and I am more than willing to help any who want to forward the enterprise. They need only apply to me.

At Mooseheart every facility is provided for observing and developing the natural bent of the child. The purpose of the order has been to take care of its orphans in the most scientific and practical manner. The child is not given an education as a matter of charity. It is given an education because the order recognizes the right of every child to the best possible preparation for its life-work. Mooseheart succeeds because its slogan is, "Every child is entitled to at least a high school education and a trade." But the trade is the thing that is stressed. The joy of working with the hands, the high satisfaction of physical effort directed toward constructive accomplishment—these are the things we

strive for. For the learning of a trade makes efficient and self-reliant men and women, a class that is sadly needed in the world to-day.

From the start each child is given every opportunity to develop his own individual aptitude and his own special qualifications. When he shows a tendency toward a special work, he is given an opportunity to try his hand at it. If he demonstrates that this is the vocation for which he is best fitted, then the theoretical side of his education is so directed as to assist him in making his way through the world by means of that vocation. The child is encouraged in his study of his chosen trade. Side by side with actual practice he learns the theory of his chosen vocation, and he develops an enthusiasm for learning that is impossible in the abstract, theoretical instruction with which we are familiar.

But the so-called classical education is not neglected at Mooseheart. As the child learns his trade he receives day by day the equivalent of a good high school education along the lines of modern

pedagogic practice. His education is balanced. He receives the mental discipline of the high school course and the physical discipline of his work at his trade. When his course is completed, he is ready to face the world, useful to himself and useful to society. His future is certain. He cannot fail. Whatever happens, he has an efficient means of caring for himself, and society will never be called upon to care for him. He is ready to take his place in the fight to make America the greatest nation in the world in industry and in commerce.

In the trade school, where youth can learn a means of livelihood while it is acquiring academic learning, lies the hope of the future. Craftsmen are to-day a vital need of the Nation. We face a world war in foreign trade. Wages in foreign countries are much lower than they are here. If we are to compete successfully, we must have skilled workmen in industry. To-day the natural desire of many of our young men to enter the trades is thwarted. A mistaken impression that work with the hands is

to be despised and a constant educational drift toward the office occupations drive many young men into uncongenial life-work, where they develop into mere mediocre characters or positive failures.

The classical fetish in our schools has led us to the point where we are woefully behind in providing the Nation with the skilled craftsmen who are the foundation of National prosperity. We must revise our educational ideals and our educational practice. We must lay before every American child his or her opportunity to choose a place in the whole wide range of vocations which make up our National life. We must give to every American child the training that will enable him to find out just where he will best fit into the American scheme of things. We must provide every child with the mental and physical equipment necessary to fill his or her place in the world with the best results to the individual and the Nation. We must educate, not alone the mentality of the rising generation, but its hand and its heart as well.

AUGUST IN THE GARDEN

BY E. K. PARKINSON

"Not only the days, but life itself lengthens in summer. I would spread abroad my arms and gather more of it to me if I could do so."

HAD Richard Jefferies experienced the tidal wave of rain from which the East has suffered so far this summer, it is doubtful whether he would have wished to spread abroad his arms and gather more of it to him. We have often heard the more poetic than practical gardener aver that there is always a charm for him in the "elusive," the "untamed in nature;" this year, then, must have been high carnival time for him, with every conceivable variety of untamed weed jostling and striving for supremacy in the vegetable and flower beds. None the less, in spite of cloudbursts, the roars of thunder, and the lightning pageants, there is plenty to do in one's garden between showers if the fruits and flowers are not to be exterminated by the weeds.

August is a busy month. In the flower garden the gladioli should be staked; the roses sprayed every week with sulphide of potassium to prevent mildew and black spot; the flowers should be picked daily to keep them from going to seed, and where they are not wanted for the house it is a good plan to cut them off as they wither; if by any chance there is a spot where the ground is not saturated with moisture, it may be well to mulch the perennial border and shrubs with lawn clippings where they happen to stand as single specimens. It will not be found too late in many parts of the country to sow beets and carrots for the winter; corn and

spinach may be planted; cucumbers, squash, and melon vines should be sprayed the first bright day to keep off the beetles, and a sharp outlook should be kept for borers.

Have pity on the lawn-mower, the most neglected tool on the place. Wipe it off after mowing the wet grass, keep it well oiled, and sharpen it occasionally. The last task is very simple; a few minutes with a sharp, flat file will do wonders.

August is also one of the best months for budding, and there is no better way of perpetuating a favorite rose. And if peach seeds have been sown in the spring, then the plants will be ready for budding in the August of the same year. Of course budding is practiced largely by commercial nurserymen, but the operation is a simple one, and will often prove of great value to the amateur.

The work is done while the bark is still loose or in condition to peel. Twigs are cut from the tree or bush which one wishes to propagate, and the buds on them are cut off with a sharp knife, a shield-shaped bit of bark with a little wood being left with them. The buds are then pushed into T-shaped slits made in the stock on which they are to grow. To hold the buds in place they are bound with a soft bit of rag or raffia. In about three weeks they will have grown fast to the stock, and the binder should be removed. The spring following the operation the stock is cut off just above the bud, which, by the way, must be inserted near the ground, and from then on the bush or tree will make a steady growth.

One should not confuse the operation of grafting with that of budding, for the former is done in the early spring before the buds swell. For example, if one wishes to change the top of an old apple tree or pear tree, the branches are all sawed off flat and by means of cleft-grafts scions are inserted, and in three or four years the tree will begin to bear again.

The gardener should bear in mind that August is the month of all months in which to set out coniferous evergreens, because they differ in their character and growth from deciduous trees and shrubs. The latter are usually moved when dormant, while the evergreens are never without foliage; therefore it is an excellent plan to move them while the soil and weather are warm and the roots active and growing. Again, by planting in August a very important point is gained, because in so doing one can actually see just how the tree will fit into the desired scheme of things before it is too late to move it. But in transplanting evergreens a few precautions are necessary. The trees should be planted about the same depth as they stood in their native haunt or in the nursery row; the soil should never be broken away from about the roots, which may be prevented by slipping a burlap bag, cut open, under the roots before lifting them; when setting them in their new position, leave the burlap about the roots, cutting off all the binding cord, and after the tree is set, well tramped down, and the hole filled, apply a good mulch, to be kept on until the following spring.

OYSTER FLEET AT BALTIMORE

FARMING, THREE FATHOMS DEEP

BY LEWIS EDWIN THEISS

DOUBTLESS it will astonish the uninitiated to learn that there is a close connection between the high cost of oysters and infant mortality. In this case of course the infant mortality is wholly ostracean. A layman with any regard for his reputation for veracity would hardly dare to give the actual figures. Yet the scientists tell us solemnly that hardly more than one oyster out of eight to thirty million born reaches maturity. For it is estimated that annually a single oyster spawns between 16,000,000 and 60,000,000 oyster larvæ, and that out of this enormous number not more than two reach full maturity.

Although these figures are no doubt approximately true, the real facts in the case are that our oysters have gone the way of our forests, our bison, our wild animals, our coal, our soil fertility, and most other natural resources. They have been ruthlessly wasted instead of being conserved. When Columbus

stepped ashore on the New World, the Atlantic coast from end to end was literally covered with oysters. To-day we have a few beds remaining.

It is doubtless true that even economic history repeats itself. Our forefathers found a virgin soil so rich it was considered inexhaustible. We have farmed it for a few generations, and to-day we have millions of acres that are considered to be worn out and worthless. With regard to farming, we have learned, in the words of a pat little jingle, that "if you put nothing in, you get nothing out." But we learned it too late, and we are paying the price to-day in the increased cost of farm products. We have another lesson in the oyster industry, for where agriculture was fifty years ago the oyster industry is to-day. We have not even begun the practice of scientific oystering.

But we have done this—at least in some States. We have put an end to oyster mining and have gone to oyster

farming. To-day we raise what oysters we eat. We sow and cultivate and harvest our oyster-beds, and allow the natural oyster reefs, or what is left of them, to remain intact by taking from them only oyster seed.

The State of New Jersey possesses in the Delaware Bay one of the most valuable oyster-beds now existing in the United States. But it would not long exist were it not protected by the State from spoliation. Only during the months of May and June, between sunrise and sunset, and with vessels operated entirely by sail power, may oysters be dredged on these natural grounds. Here at sunrise on the first of May a great fleet of hundreds of vessels is in motion. The instant the sun's red disk appears above the eastern horizon hundreds of dredges plunge overboard and thousands of oystermen toil like Trojans to gather the seed that is to produce a harvest three years later. All day long the white-winged ships beat back and

forth over these natural grounds, until their decks are piled mountain high with tiny seed oysters no bigger than one's thumb. When the ships can carry no more, off they dart to the oyster farms of their owners.

For in the Maurice River Cove alone the oyster farms total 30,000 acres, with other beds in other parts of the bay. By applying to the State, any one can secure an oyster-farm site at a rental of 75 cents an acre per annum. And a bed so secured becomes in effect the property of the lessee. Long saplings, driven deep into the muddy bottom and thrusting their bushy tops four or five feet above the tide, mark off the different oyster-beds, much as one land farm is separated from another by fence posts, though these marine division markers carry no wires. Broadcast over the acreage so secured and marked the oysterman scatters his seed, then races back to the natural beds for more, like the minute-men at Lexington, "only pausing to fire and load."

So goes the race for two months, until sunset of the last day of June puts an end to seed gathering. There are other spring activities on the oyster grounds, however, for, in addition to the seed he plants, the oyster farmer hopes to harvest an additional crop from the seed he catches. So he must put out his traps. And these are nothing but old oyster shells. All season long at the shipping point "shellmen" daily gather the old shells and "rattlers," or injured oysters that the oystermen discard when they cull their oysters. All season long the shellmen's piles of shells mount higher and higher. When the planting season rolls round, they have reached mountainous proportions. And these old shells the planters now buy back at five cents a bushel or so. Loaded to the gunwales with old shells, the oyster ships go day after day to their owners' oysterlands, where the shells are broadcasted, much as a farmer broadcasts lime upon his acres in the hope of getting a good clover "catch."

The little oysters these old shells are intended to catch are so tiny one cannot

see them with the naked eye. In view of the incredible ostracean birth rate, that would necessarily be so. For perhaps two weeks following their birth these tiny fry move about in the water, mostly moved about by the water, seeking a place of attachment. For unless they can find some hard substance to fasten to they are doomed to destruction. They cannot live in the mud, like clams. They soon smother to death. So they hunt and hunt until they find safe anchorages—in the Delaware Bay old oyster shells—and then they make fast for life. At once and with incredible speed they begin to form and deposit calcareous matter, which both forms their own shells and sticks them fast to their anchorages. In ten hours they have grown so much they are as large as grains of pepper! After that, if they escape being covered with mud in a storm and smothered, or being eaten by turtles or starfish or king-crabs, or killed by drills or sponges, and if they get by a host of other enemies and dangers, they come, at the end of several years, to the oysterman's dredge, and thence to your table and mine. And we may buy them for Lynn Haven Bays, or Blue Points, or Saddle Rocks, or any other brand you ever heard of, and yet they may have come from the Maurice River Cove. Truly there are tricks in all trades.

I found this out the first day I was ever at the great shipping port at Bivalve. An old man in oilskins was whacking away at some small oysters with a tack-hammer—at least that is the way I would then have described the operation. I found he was culling oysters with a culling hammer. He tapped each oyster to make sure it was sound. If it gave forth a hollow noise, it was a "rattler" and went into the discard, to be hauled away later by some shellman. But if it was a good oyster, he knocked it loose from any other oyster or old shell it happened to be attached to, scraped off the mud and moss, and tossed it in a wire basket. When the basket was full, he rinsed its contents in a tub of water, drained them, and put them

into a barrel for shipment. When I asked him what he was doing, he said he was "making" Blue Points.

To-day there is more romance in the oyster than in the oysterman. Time was when the oysterman was a sailor, when he went to sea, or at least to the oyster grounds, and stayed there a week at a time or until he caught a boat-load of oysters. Those days are gone. To-day the oysterman is a landsman who spends his working hours on a boat. He lives at home and goes to and from his work like the merest factory hand. But what he has lost in picturesqueness he has gained in efficiency. He catches two oysters as a landsman where as a sailor he got but one. The difference is due to that miracle worker we call gasoline.

In the old days an oyster-boat was necessarily a sailing boat. To-day it is the same craft, but it operates by gasoline, even though it still carries sails. Were it not that the State law absolutely forbids the catching of seed oysters with power boats of any description, the Delaware Bay fleet would doubtless long ago have abandoned its sails entirely. So now the sails are retained for use on the natural beds. And sometimes they help in dredging by steadying a craft, and again they are always helpful in the daily run to and from the oyster grounds when there is a favorable wind. And in some cases they are absolutely essential in rough weather. For some ship-owners have never installed gasoline engines for propelling their boats, but push their oyster ships instead with small power boats. Curious, indeed, is the spectacle of a goodly schooner, sails set perhaps, but being propelled by a chugging motor boat triced up snug against the stern. In still water, or when it is not too windy, that makeshift answers very well; but let the wind kick up a sea and the motor boat must cut loose. So the canvas sail is still the oysterman's trump card.

While yet the stars are shining the oysterman begins his day, for he aims to be at the oyster grounds by sunrise. Seemingly all the fleet wakes up at once. In the darkness scores of boats lie still

OYSTER BOATS ENGAGED IN THE CHESAPEAKE BAY FISHERIES

as painted ships at their moorings at the oyster wharves. Almost can one hear a pin drop in the silence. Fifteen minutes later the place is a-buzz with activity. Lights appear in ships' cabins and on shore. Smoke issues from scores of boats. The cooks have come aboard. Those hands who sleep on board are dressing. Others are coming from shore. Lanterns bob in the dark. Buckets drop into the tide for water. The heavy tramp of boots is heard on wooden decks. Voices sound through the darkness.

"Cast off!" comes an order from the captain of the outer boat of a half-dozen trussed up side by side to a pier end. A rope thumps on a deck. Slowly, almost imperceptibly, the shapely schooner begins to swing with wind and tide. The sails catch the breeze and belly out. The little craft describes a graceful arc, then heads down the river, her white sailing light flashing aloft, her red and green lanterns aglow in the rigging. Or, if she be propelled by a motor boat astern, a white light sparkles at her taffrail. Singly, in pairs, and sometimes even three or four abreast, the white boats head out to sea like a straggling line of sheep making for the pasture. For presently the line of sails stretches for miles along the tide and scores of oyster schooners trail each other down the peaceful Maurice River.

Within the snug, warm cabins hungry deck-hands are stowing away meals fit for kings; for the oysterman must have the best of everything, and plenty of it.

Then the bar is reached and crossed, generally, though the first day I went to the oyster grounds the entire fleet hung up on it for half an hour. And now the boats are near the oyster farms. Thirty thousand acres is a wide expanse, and for eight miles we chugged straight through oyster-beds before we came to

the grounds we were to dredge, and the end of the oyster farms was still far distant.

"There's our corner stake," said a deck-hand to me, indicating a bunch of saplings that thrust up dead ahead. A moment later we passed the stakes. "Let go your dredges!" came the command from the wheel-house. Overboard plunged the iron dredges, one on either side, while the crews stood by, ready to handle the catch. Baskets, culling hammers, and oyster shovels were within easy reach.

On we went for some space. Suddenly a noisy clanking arose in the hold. The winding drums began to revolve. One of the dredge chains became taut, then was rolled in by the revolving winder. Then the dredge itself shot out of the water, like some huge monster of the sea, slid up over the roller in the ship's rail, and was seized by sturdy hands and hauled inboard. The catch was emptied on the deck, the dredge dumped back into the brine, and, dropping to one knee, each man in the dredge crew seized a culling hammer and began to separate the ostracean sheep from the goats. The good oysters went into baskets—primes by themselves—and old shells and "rattlers" into the discard heap. Fast and nimble were the workers, yet before they could completely cull the pile the chain began to rattle once more and the dredge to come in. Seizing shovels, the cullers flung the discarded shells back into the deep, the while a new dredgeful was coming over the side. So from sunrise to ten o'clock the dredges came up, one after the other, culling hammers went tap, tap, tap, incessantly, shovels flashed in the sun, old shells went plunging back into the sea, and the pile of good oysters grew amidships by the hundreds of baskets. Then a whistle blew. The engine stopped.

The deck-hands dropped their implements and trooped to the cabin. Dinner was served.

The meal eaten, work was resumed. Until two o'clock dredging continued. Then the dredges came up for the last time and were stowed aboard. The ship picked up her heels as well as a ship could that carried four hundred bushels of oysters on her deck, and by four o'clock had covered the sixteen miles that separated her from her pier. Then the oysters were shoveled to a float, where they were to lie in the brackish water to clean and fatten, the deck was rinsed, and everything made shipshape. By five we were tied up for the night at our pier, where other workers had fetched the fattened bivalves in scows from other floats, and were busy reculling, counting, sacking, and stowing oysters aboard the waiting trains that daily carry eighty to one hundred solid cars of oysters from this great American oyster port.

One cannot see this enormous traffic in oysters without being reminded of those that accompanied the walrus and the carpenter on that fatal walk along the shore. For,

Four other Oysters followed them,
And yet another four;
And thick and fast they came at last,
And more, and more, and more.

And doubtless all of us have played the parts of the walrus and the carpenter. But, fortunately, there is little danger of all our oysters going the way of those that followed the walrus and the carpenter. For in time our oystermen have learned that if you put nothing in you get nothing out. And so, though the incredible ostracean mortality rate for infants may help to keep up the price, artificial cultivation will doubtless insure a continuation of the species.

TONGING FOR OYSTERS IN CHESAPEAKE BAY

A RETROSPECT

BY MARION COUTHOUY SMITH

"You being gone, how should I find your mate
For gentle thought and brave imaginings?"—
So once I sang; but soon those vivid wings
Were spread in flight beyond my little gate.

"How should the forest set its music free
Lacking the wood-thrush, with his silver call?"—
I asked: but now on eager ears may fall
No single note of that spent melody.

For you are gone; and neither prayer nor art
The laughter of your presence may restore.
But yet your spell is with me as before;
Your music conquers silence in my heart.

MORE ABOUT THE MORON

BY BARRON C. WATSON

IN a magazine of recent date I read a terrifying article about the number of morons in the United States. The writer adduced from statistics relating to our drafted army and from other sources the conclusion that a majority of all our citizens were morons, and then reasoned that, since the majority rules, we must be governed by a class of men with the mentality of twelve-year-old children.

With my National egotism much chastened by this startling revelation, I spent some time in reflection. Some questions occurred to me: What do these morons look like? Who is this twelve-year-old by whom they are measured? How much does a child of twelve know? Is there a race of super-morons, who attain, say, to a mentality of sixteen years, and form possibly another thirty-three per cent of our population? By what instrument is a mind measured, and who are the official measurers?

I have had a very illuminating opportunity to witness some official measuring, and can perhaps relieve the anxiety of readers who are concerned about this new peril.

Some months ago I was a civilian instructor in general education at a coast-defense fort in New England. During the previous summer a million dollars had been spent on a school for instructors at Fort Grant, near Chicago, and at this school, which I did not attend, a system of text-books and psychological tests for mental measurements had been devised. Then when the soldiers' schools like mine were in session experts came periodically to measure the capacity and growth of the students' minds and to determine who the morons were.

At that time, the fall and winter of 1920-1, the Army was recruiting as rapidly as possible, and candidates for

enlistment were not required to pass a literacy test. I had men who could not read or write in any language, foreigners who could not write the English language, and men who had been through the first few grades of grammar school. There were a few soldiers in the school who were more advanced, but most of the pupils were classed as illiterates. Of the whole number I tried to instruct during the year about seven per cent were either very stupid or half-witted; the others were fairly bright boys and men who had had very little or no schooling.

The expert appeared, provided with blanks to be filled out by the boys according to directions which he read aloud. These tests were divided into grades named after the letters of the Greek alphabet, and some of them would have been difficult for a well-educated man to have passed, as they were full of mental twisters and had to be done rapidly—the expert used a stop-watch.

The tests were almost impossible for my men. Some of them quit after the first question because they didn't know what the examiner was talking about. For instance, if the examination sheet had pictures of a half-dozen geometrical figures on it and the expert read rapidly, "If water is the liquid form of ice, put a cross in the semicircle; if not, put a triangle in the oval," and the man didn't know what a semicircle or oval was, he would give up the question. If he failed on all the others for similar reasons, he would be listed in some records at Washington as a mental deficient, and go to swell the total to show some startling and false National average, when in truth he was only an ordinarily intelligent man with a small vocabulary.

The psychologists who have made most of the tests to determine mental capacity, native intelligence, powers of observation, etc., have overlooked some factors that affect their results. One is that the tests may be couched in language that is unfamiliar to men who are intelligent but uneducated; another is that pencils and pens and paper are strange and awkward tools to a man who has spent little time in school and has not worked in a clerical trade. Some college professors would pass a poor examination with pick and shovel under the direction of a gang boss speaking the jargon of his class and trade.

During the war, officer material was selected and men were graded by tests similar to those, and to-day corporations are using the same method to determine who shall be promoted to executive positions. I think that in the war the method was efficient, since it mainly selected educated men, and for quick training they are better material because they can make better use of technical text-books. Opinions as to the value of such tests in business vary. As a basis for forming statistics to show the percentage of morons in the United States I consider most of the tests which have been used worthless.

I do not believe that half the men in this country are morons, and I do not think that tests that show such a condition are based on common sense. It is probably true that half of our citizens are very poorly educated, and that is bad enough. After going through college and working since at several different things and with all sorts of men, I am convinced that the proportion of the simple ones of the earth is not much greater on farm or ship or in mine and factory than it is in classic halls.

THE BOOK TABLE

GEORGE KENNAN'S BIOGRAPHY OF E. H. HARRIMAN¹

BY FREDERICK M. DAVENPORT

GEORGE KENNAN has done an able piece of work in memory of Edward H. Harriman—a piece of work that will enlarge the reputation of Harriman among Americans as one of the most vigorous and useful public personalities of his period. His daring, his courage, his tremendously constructive vision; his will to do, not so much for the sake of power, although he loved power, as for the sake of making his railways serve his country and the world. This picture from out the pages of Kennan's volumes makes an ineffaceable impression on the mind.

Harriman loved power and used ruthlessly every bit of it that he possessed when it was necessary so to use it. The ruthless side of Harriman, which was distinctly in the America of his period and showed itself both in American finance and in American politics, is too lightly touched by Kennan. Thus his biography becomes on this side an apology, when it should have been a human interpretation. There is a vast deal of paper wasted in justifying the Chicago and Alton activities of Harriman, which were the subject of comparatively unsuccessful attack by the Inter-State Commerce Commission and the Federal Government. Kennan pleads that everything was legal, within the rules of the time, and that the Government could not find otherwise. While this is measurably true, it is also true that the Chicago and Alton activities of Harriman are those, in particular of all his doings, which display from the beginning a dominant interest in profit rather than in railway soundness and service. In this respect the Chicago and Alton matter is very difficult to explain, because it seems unlike Harriman in any other of his great railway dealings.

Kennan has been very successful in his chapters on "The Break with Roosevelt" in establishing in the reader's good will the position of Harriman. This is all the more surprising because in its day the Roosevelt point of view swept all before it and public opinion in the country at large was heavily anti-Harriman. During the Roosevelt Administrations Harriman was the great railway figure of the country. He had combined the Union Pacific and Southern Pacific and Central Pacific and Oregon Short Line into a great system which dominated the economic and often the political western part of the United States. After the vigorous struggle against them, he had joined with Hill and Morgan in the formation of the

Northern Securities Company, to establish forever railway unity in the western and northwestern sections of the United States. Unfortunately for him, because nothing came of it but trouble, Harriman had dipped into New York State and National politics, in a field in which he had not a clever hand. He had become, as so many wealthy men have been beguiled by politicians into becoming, a collector of campaign funds in emergencies for the party, and the results to Harriman were not satisfactory. He thought that he had not obtained that peculiarly square deal out of it, that reasonable *quid pro quo* which many a business man has expected under the same circumstances! Congressman James S. Sherman had come to Harriman for financial help in the Congressional elections of 1906, had been sadly rebuffed, and had reported to President Roosevelt some very unwise alleged remarks of Harriman about an easier and more direct way of reaching Legislatures, Congress, and even the judiciary.

It was on the basis of the report of Sherman and on the basis of the general psychology of the period against railway arrogance and combination, of which Roosevelt was the National spokesman, that the President attacked Harriman as a typical malefactor of great wealth and a general all-around undesirable citizen. Harriman was caught in a very unequal political struggle, and was much disturbed. It so happened that Maxwell Evarts, a son of Justice Evarts, had been present with Sherman at the campaign conference with Harriman. Harriman took Evarts to the White House, where Evarts declared that no such language as Sherman had reported had been used by Harriman on that occasion. Although this should perhaps have been sufficient to have caused at least a shadow of reasonable doubt upon the Sherman-Harriman controversy, it never altered Roosevelt's policy towards Harriman in the slightest.

In fact, other Harriman-Roosevelt episodes in Kennan's volumes go far to convince the reader that Roosevelt, though he meant to be, was, in fact, not entirely just to Harriman. Harriman, with all his faults, appears to have been an intensely patriotic American. One of his most dynamic acts of patriotic service was his saving of the great Imperial Valley in southern California from the overflow of the runaway Colorado River, following a series of gigantic floods in the year 1906. Nothing but the dogged persistence and overwhelming efficiency of Harriman saved the homes and the lives of many thousands

of people and many millions of Government property. The whole Southern Pacific Railway organization was thrown into the breach, although the Southern Pacific had far less to lose than any other party in interest. The Government at Washington was helpless, but at Roosevelt's urging Harriman stuck to the task in the face of vast obstacles. He finally won, closed the breach and saved the wonderful Imperial Valley. It was at the very time when the Federal Government was hot on the trail of Harriman, and Roosevelt did him scant justice for his great service.

It is an interesting problem in human psychology, but I think understandable. As a matter of fact, each in his own field, Harriman and Roosevelt had notable characteristics in common. Harriman had the same daring, the same courage, the same constructive vision in business and finance that Roosevelt had in politics. And I have never known two men so much alike to understand each other, anyway. Besides, they had something of the same ruthlessness when it came to putting across what each thought should be put across. The true friends of Roosevelt always recognized both his great unselfishness and his terrific ruthlessness when once his mind was fixed upon a goal and those whom he thought he had reason to regard as enemies of his country were in his way. At times like that a passionate sense of getting a thing done right took possession of him, to the exclusion of all thought about personalities, friendships, or too close and enfeebling an analysis of facts. It was a terribly effective quality for the good of his country, but it sometimes led him into injustice to persons.

In the Harriman case, Roosevelt was the fighting leader of righteousness against some of the iniquities of the railways in his time. Harriman was a type. Harriman personified the iniquity. In his passionate eagerness to win the battle, as he conceived it, for his country Roosevelt instinctively preferred the testimony of Sherman to the testimony of Evarts and paid no attention to which of them might be mistaken, paid no regard to reasonable doubt. The testimony of Sherman nailed the malefactor of great wealth to the cross and did more than anything else to weaken Harriman in the battle before the public opinion of the country.

Both Harriman and Roosevelt were great. Each of them sought, with a greater or less degree of unselfishness, the honor and prosperity of his country. With Harriman financial profit and commercial power counted much; with Roosevelt they counted nothing. Harriman had wonderful economic vision, greater than Roosevelt's. Roosevelt had wonderful political and moral vision, the greatest of his age. It is not necessary that Roosevelt's friends should make

¹E. H. Harriman. A Biography. By George Kennan. 2 vols. Houghton Mifflin Company, Boston. \$7.50.

GEORGE KENNAN

he does. Nobody makes him—he just does it himself.”

Harriman's scientific expeditions to Alaska with John Burroughs and John Muir, his lifelong support of Dr. Trudeau in his splendid work with victims of tuberculosis at Saranac, his vast helpfulness at San Francisco at the time of the great earthquake and fire, his constructive conciliation whenever compromise was necessary to progress—these and many other incidents of his life disclose a human nature that was far from being selfish and refractory underneath, however much the surface impressions of personality might at times indicate the contrary.

Harriman was always in a struggle with the economic shortcomings of American public opinion and the American Government about railway affairs. Undoubtedly the political organization of the railways in many a commonwealth and the monopolist trend of railway minds aroused an instinctive and on the whole sound opposition on the part of the American people. But the right was not all on the side of the railway reformers. Every year since Harriman died has disclosed the need of greater unity of action and organization in order to eliminate inefficiency and waste from American railways. American law, American government, and popular opinion have always been opposed to “pooling” of railway interests. I think economists are now generally agreed that if long ago pooling had been freely allowed under Federal supervision both the railways and the country would be economically better off than they are at present. Harriman's genius and vision were in line with sound economics. But, it is also true that, in the last analysis, if either a Harriman or the country is to control, it must be the country.

The battles and skirmishes between Harriman and Morgan as set forth in Kennan's pages are very illuminating. Morgan was intrenched in the center of financial power, and usually the technical honors of the struggle went to him, as notably in the battle for the control of the Northern Pacific. On the other hand, Harriman's ideas about railways were usually wiser than Morgan's and turned out that way in the end. Harriman single-handed saved the Erie from the mistakes of Morgan. And the Union Pacific system itself is a monument to the superior insight of Harriman, who reorganized the road with enormous and permanent success after Morgan gave it up. In fact, one gets the impression that Harriman was nearly as good a financier as Morgan and a far better railway man. The growing hostility and dislike of the house of Morgan to the rising figure of Harriman were obviously an asset to the Federal Government in its hunting of Harriman, although it must be said for Roosevelt that he attacked Morgan and Harriman without fear or favor, each in his own time and each for the purpose of win-

E. H. HARRIMAN

(C) Underwood

ning the battle of the country against what Roosevelt regarded and the country regarded as the iniquities of the railways.

Harriman was a hard-working genius, but he was a genius born. At every stage he had the touch of a master workman and the vision of a master mind. He saw that a great unified railway system was essential to the arousing and developing of the mighty West. He furnished the perfect railway system, and the West responded. Somebody in an argument before the United States Industrial Commission said disparagingly: “Harriman didn't create the great West. God Almighty did that.” To which Kennan replies with the story of the Russian peasant who begrudged the ten kopeks that he had to pay for a teakettle full of hot water. “God made the water,” he declared, “and he gives it freely to everybody.” “Yes, my little brother,” replied the dispenser of the hot aqueous fluid, “God made the water, but he didn't make it hot around these parts. If you want God's water, go to the river and fill your old teakettle.”

Harriman's vision was a world vision. He nearly succeeded in girdling the earth with a transportation system by water and rail. If it had not been for the inopportune sentiment created in Japan just then by the terms of the treaty between Japan and Russia—terms which were none too generous to Japan, anyway—Harriman would probably have completed an agreement with Japan and Russia for the development of the South Manchurian and Trans-Siberian railways in connection with his own Union Pacific roads and steamers. Thus he would have girdled the world. Japan nearly acquiesced, but not quite. At the vital moment Japanese sentiment revolted against any sort of American interference or control in that part of the world where she herself had secured,

him an idol; that would only mar his fame.

Kennan makes out a good case for the human side of Harriman. When he was still a very young man and had neither wealth nor reputation, he gave himself with abandon to the organization and maintenance of a famous boys' club of very large membership on the East Side in New York, a club that for thirty years he backed in its many good works with zeal and faithfulness. In 1907, two years before Harriman died, after one of the entertainments in the club auditorium, a reporter for the New York “Herald” interviewed some of the boys as to their impressions of their founder and helper. These boys had seen Mr. Harriman. Some of them had talked with him. One of them, twelve years of age, said: “Mr. Harriman's a great man. He's the president of a railway, and he's worth a couple of thousand, anyway. He's a quiet man, and never tells anybody down here anything about his business. He isn't what I'd call a good-looking man, but I'll bet he could put up a good fight. He lives 'way uptown somewhere, in a house all to himself.”

Another twelve-year-old: “He is the nicest man I ever saw, and he gives us boys uniforms and pays for our plays. He looks just like a man who lives down here on our block, and you wouldn't think he's such a wonderful man. His clothes are just like my father's and he talks just like the rest of us. He works all day and all night, but he has to, because his railroads run all the time and he has to tend to them.”

One boy, fifteen years of age, said: “I'd rather be President of the country than president of the railways, because if you're president of the railways people say you're a bad man. They say things like that about Mr. Harriman, but we know they ain't true. If they were, he wouldn't treat us boys the way

at least from her standpoint, all too limited rights and privileges following much bloodshed and loss of treasure.

Harriman was born in an Episcopal rectory and inherited a certain pioneer daring from his father, who wandered as far as California in search of a pulpit; but the son inherited his balance and business capacity from his mother's side. He had conspicuous initiative and energy from the beginning. Dr. Trudeau, of Saranac, relates an incident of one of Harriman's trips as a young man to Paul Smith's Hotel in the Adirondacks. Paul Smith had purchased somewhere a gilt ball, which with great pride he had placed on the flagpole in front of the hotel. "I told Paul," says Trudeau, "that I knew if Ed Harriman got sight of that ball when he arrived the first thing he would do would be to shoot at it. As the stage stopped, Harriman jumped out, rifle in hand, caught sight of the bright ball at the top of the flagpole, and put a bullet through it before shaking hands with us all."

Thoroughness was Harriman's life motto. When he took possession of the Union Pacific, the road was in a deplorable condition. He learned all about it in an extraordinary way. With his engineers grouped about him in the observation car, he had the engine back that

car over the thousands of miles of his new line that he might chart every defect in rail or tie or bolt or curve or grade in the whole system. He seems never to have touched a railway without making it a better institution for the service of the community through which it ran and a more profitable property for everybody concerned. In this respect he was a marked contrast to the Jay Gould type.

It is doubtful if we shall see his like again. He belonged to the period of giants who made great contribution to material progress. In the early years of his era American government and public opinion were in a rather parlous state, measurably futile, and much looked down upon by the pioneering self-reliance of the giants. We now have a keener public opinion and a Government ever ready to act interferingly upon short notice. This is well. But is community efficiency going to take the place of the enormous individual efficiency of these earlier giants? Democracy has some distance to go before it fulfills the twofold function of looking out for the general welfare and at the same time providing efficiency and initiative either from public or private sources to make general welfare prosperous and productive.

THE NEW BOOKS

DRAMA

ESTHER AND BERENICE. Two Plays. By John Masefield. The Macmillan Company, New York. \$2.

The two dramas offered by Mr. Masefield in this volume must not be taken seriously by his readers. They were written primarily for a little group of amateur actors, among whom was the poet's daughter, Judith; and to afford this group simple dramas in verse, employing few properties and yet having stirring declamation and strong situations, Mr. Masefield turned to Racine. "Berenice" is for the most part a direct translation, but "Esther" is more of an adaptation, for the poet has removed entirely the French choruses and substituted matter of his own and greatly simplified the speeches. The results are two plays that would seem to be admirable additions to amateur drama, particularly to high school and small club endeavors.

IF. By Lord Dunsany. G. P. Putnam's Sons, New York. \$1.75.

The idea of "If" is extremely entertaining, and it affords Lord Dunsany opportunity to introduce a large number of his exotic figures of romance from some mysterious land of the East. John Beal misses a train, and for ten years he wonders what would have happened if he had caught it. A magic crystal gives him opportunity to go back ten years in his life and catch that train, and the major portion of the drama presents the strange things which happen to him, among them his being whisked off to the East. The play is written in a vein of farce slightly more pronounced than we have been taught to

look for from Lord Dunsany, and there are even signs that he had his eye on a possibly successful stage production. Still "If" is extremely amusing reading.

HISTORY AND POLITICAL ECONOMY

GREAT AMERICAN ISSUES. By John Hays Hammond and Jeremiah W. Jenks. Charles Scribner's Sons, New York. \$2.

Instead of limiting the number of immigrants in any ethnic group to a percentage of such group residing here, these authors propose as a test the readiness with which various immigrating races tend to become citizens in their new country. Certainly such a policy, rather than the other, would improve the quality of our immigration. Moreover, its control should, as the authors suggest, be intrusted to a commission composed of members of highest quality and with powers permitting it to be lenient in requirements for admission at times when we need labor and rigid during periods of unemployment. Changes in the tariff can be most wisely worked out, warn these authors, as recommendations to Congress by a permanent tariff commission whose interests will be entirely non-partisan. In the relations between capital and labor the objects to be attained can be reached, not by separate, but by combined action. This explains, as the authors affirm, why labor leaders support and why certain reactionary capitalists oppose the principle of collective bargaining. At a time when the record of Mr. Hoover as Secretary of Commerce calls attention to the part played by engineers in our Government the reader will note the opinion of one of our most eminent engineers,

Mr. Hammond, as to the contributions that can come to our political life from the profession of engineering. He says:

The engineer is exceptionally well qualified for public service. The quality of his training and the nature of his work compel him to take up every problem in the spirit of empirical science—a search for the truth; and he is accustomed to arrive at his conclusions only through a process of reasoning instead of through the influence of sentiment.

POETRY

SECRET WAY (THE). By Zona Gale. The Macmillan Company, New York. \$1.50.

Miss Zona Gale in her first book of poems attempts several forms with a high degree of success. She writes fairy stories in Spenserian stanzas, homely sketches of a Wisconsin town in free verse, employs *terza rima* with a deft touch, offers some excellently turned sonnets, and even includes a group of Hokku. She is not primarily a poet and poetry undoubtedly occupies a lesser place in her intellectual scheme than her prose, but there is a fine degree of sincerity in her verses. There is no doubt but that the "News Notes from Portage, Wisconsin" are the best part of the book, but none of them are quite short enough to lend themselves for successful quotation. The reader must be contented with "Wonder!"

Here are the shadows veiling green
with gray

And winning all the wonder from the
light;

Here phantom fragrance swells and
fails like sound;

The hour distills itself to dark; the
day

Dreams in its grave and lo, the dream
is night.

•Beloved, all the marvel of the May,
The altared dark, the petals' solemn
white,

The moments rich with farewell from
the lips

Of dying moments—what are these?
We lay

Our love beside them and exceed the
night.

Not merely one improved main highway, but a network of smooth, dustless, economical roads—this is "The Magic of Tarvia."

The Magic of Good Roads—

HALF a century ago the railroads reached far out into the wastes of the continent—tapped vast reservoirs of undeveloped wealth—lifted the pall of isolation from frontier life.

Today, improved highways are completing the work that the railroads then began—are doing for individual districts what the railroads did for the country as a whole.

The old-time "isolated community" is rapidly vanishing. In its stead are seen progressive towns and villages—centers of ever-widening circles of business activity. This is the magic of good roads.

Nor are the benefits confined to towns and villages. Good roads make farming more profitable.

They bring to the farmer and his family greater social advantages and better educational facilities. They make farm life more attractive.

Yet with all their blessings, good roads need not be expensive. Whether for residential streets or country highways, Tarvia is the quickest, surest, most economical way to all-year roads, free from mud, dust and ruts and proof against water, frost and traffic. It is a coal-tar product made in grades to meet every road condition.

One Tarvia road in your community will prove to you and your townspeople how good roads, with all their benefits, can be had at low cost.

Illustrated booklets free upon request.

All letters of inquiry should be addressed to THE OUTLOOK FINANCIAL DEPARTMENT, 381 Fourth Avenue, New York.

MILK OUT OF A STONE

THERE is much talk nowadays about a living wage for all those who engage in industry. If it is true that human beings are entitled to a living wage, what about businesses which are essential to the industrial life of the Nation also being entitled to a fair percentage of earnings? If a man cannot earn enough money to supply himself with decent food, clothing, and living quarters, it goes without saying that that man's efficiency will not be as high as that of another man who can get these things. Few people will argue this point, whether or not they consider that every one is in fact entitled to a mini-

mum compensation for his services. No starved horse can pull a heavy load.

So it is with business enterprises. Unless their earnings are sufficient to enable them to function properly they cannot render efficient service. This applies particularly to industries like the railways, the transit companies, and the lighting and power corporations. The whole theory of these enterprises is to render efficient service to the public. Billions of dollars of capital are invested in them and they are in constant need of additional capital. In order to attract investors a fair return

A Guide to Investment Selection

OUR monthly booklet, *Investment Recommendations*, serves many investors as a guide to the purchase of securities.

It contains a diversified list of securities, including government, municipal, long and short-term corporate issues, and other recommended bond offerings of attractive yield.

Concise descriptions are given of many of the securities together with current financial data on the issuing companies. This information will be found valuable in the selection of suitable investments.

Upon request, at any of our offices, we shall be glad to send you the current issue of *Investment Recommendations*.

upon the money invested must be assured. The rates which these corporations may charge are determined by State and National commissions, which is another way of saying that they are paid fixed wages, just like the individuals who work for them. If these wages are not sufficient to insure adequate service and a fair return upon the capital invested, how is capital to be obtained? Corporations engaged in rendering service to the public are entitled to a living wage just as much as any individual, for the fortunes of the whole country, millions of individuals, are bound up in them, and their existence is essential to our National life.

When a railway or a trolley company, or a gas or electric company, applies for permission to increase rates, a loud howl instantly goes up from thousands of throats, and the occasion is usually seized upon for personal advantage by numerous politicians. It is a curious circumstance of American life that we view almost every move of these kinds of companies with suspicion. There is another side to the question, however, that frequently has been too little considered, and to illustrate what it is a little story may be of assistance.

In a small town of the writer's acquaintance there lives a woman accustomed to ride back and forth to a neighboring city, five miles distant, every day for business. The trolley company charges one fare each way. Several years ago the fare was five cents; now it is eight. Recently this woman launched a bitter tirade against the trolley company because of what she described as its exorbitant charges.

"Suppose," the writer asked her, "the trolley was not there; how would you get to work?"

She didn't know. She admitted that it is too far to walk. A taxi would be out of the question, and the streets are too crowded with traffic to make a bicycle safe, and on many days the weather makes bicycle riding out of the question. The conclusion seemed to be that the trolley was the only feasible means of transportation.

"Very well," we said. "Is eight cents much to pay for a five-mile ride?"

"Perhaps not," she admitted.

"All right, then. One final question," we said. "Suppose the trolley company cannot operate its cars unless the passengers pay an eight-cent fare. Would you rather pay the eight cents or have the trolley line given up?"

She said that she was convinced.

People too often ignore this aspect of the matter.

Another thing we as a people like to do is to criticise the service these corporations render us. Perhaps one reason for this is that we are spoiled, accustomed to such good service generally that any breakdown is exaggerated in importance. But remember that none of these companies gives poor service intentionally. When the electric lights go out all over town and stay out for an hour, it is well to bear in mind that all the electric-light meters stop registering for an hour too, and the company is that much out of

7% IN THE NATIONAL CAPITAL

WASHINGTON enjoys the distinction of being the only city in America which has directly back of it the tremendous power of the United States Government in improvement and development.

Our 7% Safeguarded First Mortgage Investments are secured by improved, income-producing property in Washington, and have behind them our record of *no loss to any investor in forty-nine years.*

These investments are offered in denominations of \$50, \$100, \$500 and \$1,000, with a choice of maturities from two years to ten years. Under our Investment Savings Plan partial payments earn 7%.

FINANCIAL DEPARTMENT

(Continued)

pocket. When a trolley wire is down, the trolleys stop running, and not only the passengers are inconvenienced but the trolley company loses a great many fares. When an accident happens to cause a railway train to be late, that costs the company money. When a power plant breaks down, revenue is lost until repairs can be made. No company is in business to incur losses, and defective service is expensive to any company.

Remember, therefore, that every company is doing the best it can, and that when anything happens to impair its efficiency the company suffers more than you. And where would our modern civilization be without railways, gas, electric light and power companies? We take them more or less for granted, but if they should all suddenly cease to operate practically every person in the country would feel the effects within twenty-four hours.

So when these companies ask a living wage for themselves don't begrudge it to them, any more than you would to yourself if you were a worker in a factory asking the same consideration. Ask yourself what you would do without these corporations, and the chances are that presently you will be working for them and not against them. Happily, this attitude is becoming increasingly prevalent and people are realizing more and more that a public service corporation must have earnings just as much as a horse must have food.

So it is with an individual and his savings. No man can expect a savings account to grow unless it is fed. No man can expect to own bonds and stocks unless he saves the money with which to purchase them. Riches don't grow on trees, but are the result of hard work, thrift, and self-sacrifice. There is no more tragic sight in the world than a person grown old, unfit any longer to earn a living, and dependent upon the charity of relatives. On the other hand, there is no more satisfactory feeling than the knowledge that you have saved a competence to shield you from the ever-present wolf at the door. Wasn't it Mr. Micawber who said that a man with an income of four pounds a week who spent the four pounds was sure to end up a pauper, but if he spent three pounds nineteen shillings and regularly saved the other shilling that meant independence? And there is truth in what he said. Regular saving is what always counts in the long run, and even if the amount is not large enough ever to win riches for you, it unquestionably will mean at least a certain amount of independence. And independence is worth working for.

Saving is essential to all success. This applies just as much to a corporation as it does to an individual, for the rainy days come to both. So remember that if you yourself must earn a certain amount to enable you to take proper care of yourself and put something by for the rainy day the same thing applies to big business enterprises as well. It is impossible to get milk out of a stone

BY THE WAY

THE American Automobile Association offered a prize of \$25 for the best new word descriptive of the reckless automobile driver. The word which won the prize was "flivverboob." The word seems to us descriptive so far as it goes, but not all the people to whom it is meant to apply drive flivvers.

The phone family has a new member fathered by the Bureau of Mines. It is the geophone. It is developed from an instrument used in the World War to detect earth and rock sounds made in the construction of military mines and tunnels. In peace it is applied, among many things, to the saving of the lives of miners entombed as a result of fire and explosions. By the use of this instrument it is possible to locate the approximate position of an entombed miner through many feet of earth and rock. The new instrument can also be used to detect the location of leaks in water mains.

The ways of the swindler are manifold and the Post Office Department is kept busy preventing the misuse of the mail. One colored gentleman recently offered to sell for \$10 the "Keys to the Kingdom." Instead of a free pass to heaven all his many dupes received for the money was a printed pamphlet containing a jumble of absolutely unintelligible verbosity. The swindler, on being caught, swore to reform, but not long after was caught again at the same game.

The Kansas City "Star" tells us that the Missouri Highway Commission laid out the main road between Kansas City and St. Louis in a line which touches but does not pass through the centers of population. The rapid growth of automobile traffic forced the adoption of this plan. The time may come when towns will be as glad to get through automobile roads away from their main streets as they are now to effect the removal of railway tracks at grade.

The Portland "Oregonian" reports that Jackie Coogan, the side-partner of Charlie Chaplin, has in his eighth year earned \$1,000,000. It is not surprising that the "Oregonian" finds cause to wonder in the fact that a boy who might in the progress of normal boyhood, by catching his first bullhead has already smiled his way into the millionaire class. Jackie Coogan has apparently found a treasure beyond even the dreams of Huck Finn.

Dr. Charles Park, although a lover of Latin, told at a recent gathering of the protest of a Brown University sophomore against study of the dead languages. The sophomore, according to Dr. Park, pasted the following lines "To the Dead" on the University bulletin board:

All are dead who spoke it.
All are dead who wrote it.
All are dead who learned it.
Blessed death! They earned it!

PULLING MAIN STREET
OUT OF THE MUD

BY
NEWTON FUESSLE

The Test of Good Will

MOST manufacturers appreciate the importance of good will on the part of the dealer, and count it one of their greatest assets. But many of them need to consider more thoroughly in what good will consists.

The final test of good will is the salability of the product—the consumer demand.

The dealer may be willing to concede the high standing and prestige of the manufacturer. He acknowledges freely that it is one of the foremost concerns in the business, that it is backed by men who have a solid reputation in their industry, and that its relations with the dealer are businesslike and pleasant. He is disposed to estimate all these things at full value.

But all this good will cannot materially help the dealer sell your goods unless the public is disposed to buy them.

The kind of good will that counts most with the dealer is the good will of the public towards your goods.

If the consumer is demanding your product, and the dealer is able to supply it at a profit, he will have ample good will for the house that makes this possible.

There is just one way to build up this consumer good will, and that is by making the product right and telling the consumer about its merits through Advertising.

With the consumer demanding your product, and the dealer disposed to give it every preference, its steady sale is certain. Good will becomes a big reality in business when that good will extends to the *consumer*. More and better advertising will create the kind of good will that every manufacturer needs most.

A War on Film

On the film that ruins teeth

Dental science has declared a war on film. Millions of people, half the world over, have joined it. And leading dentists everywhere are securing new recruits.

This ten-day test will show you the results. Make it and note the change that comes in cleaner, prettier teeth.

Makes teeth dingy

Film is that viscous coat you feel. It clings to teeth, gets between the teeth and stays. It makes white teeth look dingy. And most tooth troubles are now traced to that film.

Film is what discolors, not the teeth. Film is the basis of tartar. It holds food substance which ferments and forms acid. It holds the acid in contact with the teeth to cause decay.

Germes breed by millions in it. They with tartar, are the chief cause of pyorrhea. Many serious troubles are now traced to them.

Failed to end it

Old teeth cleaning methods have failed to end film. Much was left to, night and day, threaten serious damage. That's why well-brushed teeth discolored and decayed.

Dental science has for years sought ways to fight that film. Two effective methods have been found, and able authorities have well proved their efficiency.

Now those methods are combined in a dentifrice called Pepsodent—a tooth paste based on modern dental knowledge. And to millions of people it has brought a new era in teeth cleaning.

These five effects twice daily

Pepsodent combats the film in two effective ways. It leaves teeth highly polished, so film less easily adheres.

It also multiplies the salivary flow. That is Nature's great tooth-protecting agent. It multiplies the starch digestant in the saliva. That is there to digest starch deposits that cling. It multiplies the alkalinity of the saliva. That is Nature's neutralizer of acids which cause decay.

Every application brings these five de-

sired effects. All of them are deemed essential. But old methods never brought them.

Send the coupon for a 10-day Tube. Note how clean the teeth feel after using. Mark the absence of the viscous film. See how teeth whiten as the film-coats disappear.

In a week the results will surprise and delight you. And your home, we believe, will adopt this new method. Don't wait longer. Cut out the coupon now.

CONTRIBUTORS' GALLERY

Two articles by Clifford A. Tinker, who is a lieutenant in the United States Navy, have appeared recently in The Outlook. Both described contributions made by the United States Navy not only to naval science, but to modern navigation: One of these concerned the use of radio on the sea, the other concerned the adaptation of the ancient catapult to modern aviation. Lieutenant Tinker is in the Bureau of Aeronautics.

HERBERT S. GORMAN, essayist as well as poet, a native of Massachusetts, has contributed to various newspapers and periodicals including The Outlook.

JOHAN C. LONG was graduated from Amherst in 1914 and received a fellowship in economics and sociology from Harvard in the following year. He is now Secretary of the National Automobile Chamber of Commerce.

NEWTON A. FUESSLE, whose contributions have become familiar to the readers of The Outlook, has been in newspaper work in Boise, Idaho; in Seattle, Washington; in Chicago, Illinois; in Sioux City, Iowa; in Omaha, Nebraska; in Cleveland, Ohio; and in New York. By this time he ought to know Main Street, whose fortunes in being pulled from the mud he rehearses in this issue. Mr. Fuessle, whose name is pronounced with consummate ease when the trick is known, is a member of The Outlook's staff.

IMOGEN B. OAKLEY sends her contribution from Philadelphia, where professional municipal politicians need watchers if any do. Several years ago Mrs. Oakley contributed to The Outlook an account of "The Protest Against Noise" and its effect on city life.

HUBERT VANSANT CORYELL, a native of Cornwall, New York, where he received his preparation for college in the public day school and at the Cornwall Heights School (now the Stone School), a graduate of Harvard, has been a physical instructor and a teacher of English for the past eleven years, first in the public schools of St. Louis, then as assistant principal and principal successively in the Shady Hill Country Day School, Philadelphia, and finally in Browne and Nichols School, Cambridge, Massachusetts, at which institution he is now head of the Junior Department. His knowledge of boys, thus based on experience, has certainly not been blunted by the fact that he has been coach of the Harvard gymnastic team.

The Outlook

AUGUST 16, 1922

CANCELLATION OF WAR DEBTS

IN April, 1915, Theodore H. Price, editor of "Commerce and Finance" and a long-time and valued contributor of financial and economic articles to The Outlook, expressed the opinion in these pages that the Interallied war debts were so vast that they could never be paid and might have to be canceled and charged to the profit-and-loss account of the war. When he made this statement it was considered extremely visionary and impractical. The chaotic condition of international trade and finance, however, has been focusing the attention of the world upon these enormous debts, and has made the question, "What shall be done with them?" a very real and practical one. The liveliest debate in international politics to-day is that connected with the proposed cancellation of these war debts. There appears to be in some quarters a confusion of thought as to what these debts are, and therefore what it is proposed to cancel.

Cancellation is a very different thing from repudiation, and therefore a very careful distinction must be made between the debts of the Allied Governments to private individuals through the sale of bonds and the debts of Allied Governments to each other. There is no thought that the money which was borrowed from private investors by the sale of such bonds as the well-known Anglo-French bonds is not to be repaid in full with interest. The war debt which is referred to in any discussion of so-called cancellation is the debt of governments to governments. The Government of Great Britain owes the Government of the United States about eleven billion dollars; and other Allied Governments owe Great Britain about sixteen billion dollars. The British advocates of a cancellation point out that their proposal cannot be regarded as one of mere selfishness, because they will forgive others five billions more than the United States will forgive them. This argument, however, seems to ignore the fact that by general cancellation Great Britain would sacrifice five billion dollars, while the United States would sacrifice eleven billions.

THE ARGUMENTS FOR CANCELLATION

THE American advocates of cancellation are chiefly those who, by situation or training, feel the great importance of the stability of international

trade and finance. They include most of the great international bankers, such as Messrs. J. P. Morgan, Otto Kahn, Paul Warburg, and Frank Vanderlip. These gentlemen, who speak with authority, and whose words deserve most careful consideration, point out that the domestic finances of the United States can never get back to normal and stable conditions until European finances are stabilized and exchange returns again to what President Harding calls normalcy. They say, with reason, that no merchant can sell goods to England, France, Italy, or Germany until he knows what kind of money he is going to get in payment; that, with the French franc, the German mark, and the English pound going up and down like a thermometer in an August hot spell, American farmers and merchants will continue to suffer from spasms of financial heat and cold; that cotton, wheat, and hogs, which must be sold to Europe and Asia if real prosperity is to return to this country, cannot be sold until a stable token of exchange is re-established; that Europe is practically bankrupt, and, like any other bankrupt, she cannot resume her normal industry in commerce until she compounds or settles with her creditors; that the European Governments can never pay England sixteen billion dollars and at the same time restore their own destroyed industrial life.

In effect, what they propose is that Europe shall go through bankruptcy proceedings; that her war debt—except to private individuals—shall be wiped out, so that she can begin again, with renewed determination and courage.

THE ARGUMENTS AGAINST CANCELLATION

THERE are two main arguments in this country against this policy of cancellation. The first is purely material and financial, but nevertheless a just and effective one. The war, out of which the United States got nothing in benefits such as colonies, ports, extended boundary-lines, imposed on the American people an enormous burden of taxation. This fabulous increase of taxation is indicated by some very simple figures. Mr. David Friday, in an article in the "New Republic" of August 2 on taxation, points out that in Michigan the State and local taxes have increased from \$39,000,000 in 1911 to \$158,000,000 in 1921; that in Kansas in the same period of ten years the State and local taxes

have increased from \$28,000,000 to \$76,000,000; that in Massachusetts taxes have grown from less than \$100,000,000 to over \$250,000,000; and that taxes in Ohio have trebled. In the year 1911 there was paid to the Federal Government in the form of taxes by Michigan \$7,000,000; by Ohio, \$21,000,000; by Kansas, \$500,000; by Massachusetts, \$7,000,000. In the year 1921 Michigan paid in Federal taxes \$272,000,000; Ohio, \$285,000,000; Kansas, \$38,000,000; and Massachusetts, \$259,000,000.

While the tax burden is not as severe in the United States as it is in Europe, it is growing intolerable, and this is no time to cancel foreign debts amounting to eleven billion dollars. The attitude of the Administration is against cancellation, and Mr. Mellon, Secretary of the Treasury, although he advocates funding the foreign debt—that is to say, putting it in such a form that the European Governments can be given time and consideration in the payment—feels that for the present at least they should be held accountable.

The second objection to cancellation may perhaps be called a moral one. It is said that, while deserving debtors are often partially or wholly forgiven their debts in order that they may start over again and build themselves up, Europe has not yet proved itself to be a deserving debtor; that the various European Governments are still maintaining arms, manufacturing munitions, and actually fighting and killing each other, and to some extent at least pursuing the policies of political ambition, selfishness, and aggrandizement that led to the Great War. Those who hold this view assert that Europe will never come to her senses, reform her methods, and devote herself to reconstruction and productive industry until she realizes that she must squarely and fairly assume the responsibility of the burdens which she created for herself and for the world by a long course of political and social malfeasance which led to the World War.

SENATOR BORAH'S VIEW

SENATOR BORAH is unquestionably the ablest spokesman of those who believe that, while the United States must do its part in world reconstruction, it can do nothing and ought to do nothing, until there is a reform of spirit and methods in the European countries. We quote his opinion:

There is one thing in all this discussion from abroad relative to can-

celing the foreign debts which is never mentioned. It is wholly ignored in the letter by the British Government addressed to France, but intended for the United States, and that is the subject of disarmament.

The people of the United States could never be greatly interested in any proposition for the cancellation of any part of the debt to the United States unless the proposition is accompanied by a definite and specific plan supported by certain guaranties for practical disarmament, both by land and by sea. There is nothing to be gained by our canceling this debt, or any part of it, if the gigantic military and armament programmes in Europe are to continue. It would amount in practical effect to our aiding and abetting the building up of these great military and armament establishments, and thereby abetting war.

If cancellation is to be at all, it should be considered in the interest of humanity, of economic sanity, and not to enable these countries to build up and maintain these military establishments, these great armies which are now burdening and torturing and threatening Europe and which will lead inevitably to greater suffering, more misery, and more war.

Within the last week the Premier of England has declared: "Keep your eye on what is happening. They [the nations of Europe] are constructing more terrible machines than even the late war ever saw. What for? Not for peace. What are they for? They are not even to disperse armies; they are to attack cities unarmed, where you have defenseless populations to kill, to maim, to poison, to mutilate, to burn helpless women and children."

Now, if this is the situation and this is the programme, and this cannot be changed, it is more or less an impertinence to talk about canceling debts in the name of economic rehabilitation. If these plans and schemes are to continue to go forward, we cannot help Europe by canceling our debt to France or any part of it.

I feel, therefore, that in order to interest anybody who is interested in humanity, or the cause of peace, or the restoration of economic sanity, all schemes for canceling debts should be accompanied by a practical plan for disarmament.

A SUMMARY OF OPINION

NOTWITHSTANDING the opinion of such American financiers of international reputation as Mr. Morgan and Mr. Vanderlip, it is quite apparent that the preponderating sentiment of the country is against cancellation of war debts at the present time. The American people are not of a character, or in a mood, to exact the last pound of flesh. They are rather in the attitude of mind of a merchant who wishes to be just to a bankrupt debtor, and even to hold out a helping hand to him, but does not propose to take any definite steps as to the settlement until he is fully assured

of the character, industry, capacity, and good faith of the debtor. Perhaps the Omaha, Nebraska, "Bee," published in the geographical center of the United States, represents in what it says also the central view-point of the country:

Lord Balfour's note to the European Powers on the subject of war indemnities is a rather awkward attempt to drive a wedge between the United States and those nations that owe money to other nations. . . . Europe's situation will be improved when some imperial programmes are set aside and attention is given to settlement of obligations that rest on all. The way out is not through cancellation of debts, but along the well-known path of hard work.

Senator Hitchcock, also from Nebraska, states the position of the country in this way:

Congress will never authorize cancellation until the American people are convinced that there is no other way to save the situation. If they see American trade destroyed and all other efforts to restore stable conditions fail, then, but not until then, they might consider this proposition.

There is in existence an official body called the Debt Refunding Commission. The view of the Secretary of the Treasury, Mr. Mellon, is that this body should go on with its work in preparing a plan for funding foreign obligations to this country. The New York "Times" quotes a high fiscal officer of the Government, presumably Mr. Mellon, as saying, "If the European Governments would make a bona-fide effort all around to balance their budgets, they would be able to pay their debts to this country on any equitable refunding basis."

The question of cancellation has been raised in an acute form at this time by an identic note addressed to the Inter-allied Powers by Lord Balfour, as Acting Secretary of State for Foreign Affairs in the Government of Great Britain. With regard to that note the London "Chronicle" remarks:

The British note definitely lays it down that there can be no financial settlement between Great Britain and her late allies until some settlement is possible with the United States. America is thus once more made the arbiter of the economic fortunes of Europe. It is very likely that the necessity for universal cancellation of all forms of international indebtedness is as plain to the Washington Government as it is to ourselves; but the Washington Government has the American public to consider, and the American public has not yet learned the hard economic lessons with which we in Europe are now only too familiar.

The "Chronicle" is quite right. If the Harding Administration should at this time consent to the implied request of

Lord Balfour, we do not believe that it would be sustained by the country.

THE ILLINOIS CONSTITUTIONAL CONVENTION

AFTER intermittent sessions extending over nearly two years, the Illinois Constitutional Convention has practically finished its labors and has formulated a document that will be presented to the people of the State for adoption or rejection December 12 next. Some citizens wanted the Convention to submit its recommendations in the form of separate proposals, as has been done in Ohio, Massachusetts, and other States, but this suggestion was overruled. The people will have to vote upon the matter as a single proposition.

In personnel this Constitutional Convention, the first Illinois has had for over half a century, was an unusual body. It was made up for the most part of leading business and professional men, of conservative temper. As a collective group the Convention floundered for some time. In the last few weeks of its sitting, however, the gathering put the proposed new Constitution into a form much more satisfactory to progressive citizens than had been anticipated.

The provisions relating to Chicago are especially noteworthy. That city, if the new Constitution is approved on a referendum vote, will be given the power to issue such amounts of regular city bonds for the acquisition of and development of transportation facilities as may be necessary for the purpose. This will enable the city of Chicago to take over the surface and elevated lines, to build additional facilities, including subways, and to operate the system itself or to utilize a private or trustee agency for operating purposes. Most of the members of the Illinois Constitutional Convention are personally opposed to the policy of municipal ownership, but they were influenced by the argument that practical conditions in Chicago render it necessary that the city be given power to municipalize the traction system. There is a stipulation that fares must be kept high enough to make the system self-supporting, which means that, while the credit of the city is behind the bonds, it is not expected that taxpayers will be called upon to pay them so long as raising fares can keep the plant self-supporting. It is provided, too, that a municipally owned transportation system must pay taxes like private property. The added borrowing power given may be used only for transportation and water—not for any other utility. It is significant, too, that this added borrowing power for municipal ownership pur-

poses is given only to Chicago. Some down-State cities wanted the provision made State-wide in scope, but this request was accorded scant consideration.

Chicago also is given by the proposed new Constitution large powers of local self-government, including the right to frame and adopt its own charter. So far as structure of local government is concerned, the charter made by the city itself and adopted on a referendum vote cannot be modified by State law. In the exercise of the powers of government the city is subject to legislative control through general law. Smaller cities in other parts of the State were denied the home-rule charter-making powers granted to Chicago. In many situations heretofore it has been the other way—small and medium sized cities being granted rights denied to the great center of population.

In its earlier days the Convention devoted many hours of bitter discussion to the initiative and referendum and to the limitation of Chicago's representation in the Legislature. The proposal for the initiative and referendum was decisively beaten. The plan to limit Chicago's representation in both houses of the Legislature was backed by down-State leaders and by the Anti-Saloon League. This matter was finally compromised by giving Chicago representation in the lower house in proportion to its voting strength, and limiting it somewhat in the Senate and in future constitutional conventions.

The campaign for and against the proposed new Constitution prior to the election of December 12 promises to be spirited. The Hearst papers will oppose the document because it does not contain the provision for the initiative and referendum. Mayor Thompson's organization also is expected to be in opposition. Mayor Thompson has a particular municipal ownership plan of his own—which many persons think is unworkable—to which the debt limit provision of the new Constitution is considered a rival.

Where a document containing many features is submitted to a referendum vote as one proposition, opposition naturally develops on various grounds, and this Constitution may therefore quite possibly fail of adoption. But if it should be adopted it will be of National interest because it frankly recognizes a problem of government arising out of the rapid growth of great urban centers of population in this country. This problem is to give huge cities like New York, Chicago, Philadelphia, Boston, St. Louis, control over their own purely local affairs, like street transit or municipal police, without also giving them

control, by a preponderance in the Legislature, of the local affairs of other communities or of the issues which affect all the people of the State, rural and urban alike.

REBUFF FOR EX-PRESIDENT WILSON

JAMES A. REED, Democrat, of Kansas City, Missouri, has been renominated in the primaries of his party to succeed himself as United States Senator. He

P. & A. Photos

SENATOR REED, OF MISSOURI

has just finished his second term of six years in the Senate.

Mr. Reed was born in 1861 in Ohio; was educated in the public schools and in a small Iowa institution called Coe College; never went to law school, but had his legal education in a law office in Iowa and began practice in that State. He moved to Missouri in 1887, and immediately entered politics. He has been prosecuting attorney of his county, and Democratic Mayor of his city for two terms.

Without a very rich intellectual or cultural background, he is a man of great force and native power of language. He can sway a popular audience by invective which recalls ante-Civil War days. His convictions often seem to be prejudices, but it must be said that he is courageously true to these convictions or prejudices. He is

an old-fashioned Democrat in the sense that he deplores centralized power in any form and is a believer in untrammeled individualism. This deep feeling led him to attack President Wilson's creation of the League of Nations, and thus to enter upon a bitter personal controversy with Mr. Wilson himself.

In this controversy the two men attacked each other, Mr. Wilson using a cold and glittering stiletto, Mr. Reed a hotly swung bludgeon. The result was that when in the early part of this year Mr. Reed signified his intention of entering the Senatorial primaries of Missouri for renomination Mr. Wilson used every power at his command to prevent that renomination. The Missouri Democrats put up as an opponent to Mr. Reed Mr. Breckenridge Long, a St. Louis lawyer of high character and lineage. He is a graduate of Princeton and of the St. Louis Law School, and is an expert in international law. Mr. Wilson supported his candidacy, and by personal letter urged his party in Missouri to repudiate Senator Reed. The struggle between Mr. Long and Senator Reed was a protracted and vigorous one; but, in spite of all the influence which Mr. Wilson could exert, Mr. Reed was renominated. This result may be fairly taken as a repudiation by the Democrats of Missouri of Mr. Wilson's policies and leadership.

UMPIRES AND MORALS

THE American people want their amusements decently, honestly, and fairly administered. At least this is a reasonable inference from the fact that the three great amusement trusts—if we may use that much-abused and often misunderstood designation—have each appointed a prominent man to act as an umpire of their moral conduct. Professional baseball, the motion-picture industry, and the theater are these three amusement trusts, and they may justly be so called because each of them is in the hands of a comparatively small group of men.

The professional baseball interests were the first to take this method of winning back a somewhat shaken public confidence. They appointed Judge Landis, a distinguished Justice of one of the high Federal courts, at a large salary and with comprehensive authority, to root out bribery and corruption among the players and to adjudicate in financial or other disputes among the owners of the baseball clubs. Judge Landis at once attracted public attention by severely disciplining "Babe" Ruth, one of the most popular and highly paid professional baseball players of the day.

These plans seem to have worked so

well in baseball that the moving-picture men obtained the services of ex-Postmaster-General Hays to perform the same function in their industry. Mr. Hays has a large and well-organized office in New York City, where he not only attempts to co-ordinate the conflicting interests of the moving-picture business, but to exercise some control at least over decency and good taste in the production of films. It is too soon yet to form any judgment as to the effectiveness of his work, although it may be said that his plans and purposes are high, and if they can be carried out they will be serviceable both to the moving-picture producers and to the public.

The other great amusement business to adopt this method of appointing a grand umpire or referee is the Producing Theatrical Managers' Association. They have named Mr. Augustus Thomas for a term of three years, at what is said to be a large salary, to act as a judge of last resort in any contentious questions connected with the Association. In a newspaper interview Mr. Thomas intimated that he did not believe in Governmental censorship of the stage:

"Once we are functioning," he said, "we can get to a matter like this before the police do, and thus save a lot of trouble. As a matter of fact, there is little need for condemnation or alarm in that direction. The theater is governed generally by men of true instincts and of intelligence, and the occasional questionable plays have been overshadowed by the production of good stuff. Only those who know the theater are capable of giving it proper care, and it is my hope that the Producing Managers' Association will be antiseptic instead of corrosive. . . . I am going to try to bring harmony to all the interests that make up the theater and the stage—actors, managers, dramatists, artists, etc. And differences that arise between the members of the Managers' Association over the interpretation of contract clauses and the like I shall try to iron out. But I'm not going to be as autocratic as Judge Landis. He can reach out and put Babe Ruth off the field for a month, but my big stick is going to be mainly talk."

Mr. Thomas has been a successful actor, and is now dean of American playwrights. He is a cultivated gentleman, and he has the advantage of both high standards and of a practical knowledge of the theater. He ought to be able in his new position to do good service to his profession. We shall print next week an interview obtained from him by a representative of *The Outlook*.

A passion for umpires seems to have penetrated even the field of publishing, and it has been suggested by Mr. Sumner, the successor of Anthony Comstock,

P & A Photos

A CAPTAIN OF THE PENNSYLVANIA STATE POLICE WARNING STRIKING MINERS NOT TO CONGREGATE IN GROUPS OF MORE THAN THREE

that the publishers ought to appoint a head man who can tell them how to print decent literature if they do not want to be subjected to Government censorship. The suggestion has aroused vigorous opposition on the part of the publishers, and this opposition seems to us to be natural and proper. In the case of baseball, moving pictures, and the theater, there are questions of contracts, agreements with players, wages, and other social questions within the industry itself which the umpire must settle, but there are no controversies exactly similar in the publishing trade. After all, decency and good taste are matters of instinct and education, and, while regulation and sometimes law can help, the most effective way to put a stop to "thrown" baseball games, suggestive or crime-exciting moving pictures, and indecent novels is for the public to refuse to pay money for their production.

THE COAL STRIKE CONTINUED

OVERSHADOWED by the railway strike as it developed during the first week of August, the strike of the coal miners has been receiving a diminishing public attention. This is not because there has been any less apprehension of a coal shortage, but because people gen-

erally have recognized the railway strike as perhaps contributing even more to the dangers of the situation than the strike of the miners themselves. These two major strikes, occurring at the same time, have created a situation quite unprecedented in America. Although winter is still many weeks away, the danger of a real disaster to industry because of the lack of coal when snow and ice will make transportation difficult, is recognized as acute.

The failure of the National Administration so far to bring about an end of the coal strike and the appeal of the President to the Governors of the States have resulted in some State action. In many places the militia or State police have been on guard. In Indiana, Governor McCreary has declared martial law in a territory of about eight square miles in Clay County, and has seized two mines for State operation and invited Indiana miners to work in the strip mines at the wages in vogue on March 31. Though nothing that the Administration has done has seemed to bring an end of the coal strike nearer, its action has done much to provide a fair distribution of the coal supplies that will be available. For this purpose Henry B. Spencer, former Vice-President

P & A Photos

EVICTED PENNSYLVANIA MINERS TRYING TO MAKE NEW HOMES OUTDOORS AND IN TENTS

of the Southern Railway and during the war the purchasing agent for the Federal Railway Administration, has been appointed by President Harding as Fuel Distributer. The Federal Coal Board, under his general direction, will ultimately take the entire output of the coal mines of the country and will distribute it according to the needs of the various interests. Offices have been opened in various parts of the country. A railway coal committee will apportion coal supplies to the different railways. By this means, though the production of coal will not be directly affected, the evils of the coal famine will be minimized.

In the meantime a conference was held in Cleveland between representative mine operators and mine workers. On Monday of last week Mr. Lewis, President of the United Mine Workers, declared that as a result of the conference a settlement of the strike was only a matter of a few days. There are indications that some of the miners are drifting back to work, but it is virtually certain that no resumption of mining can take place without some organized action. It is clearer than ever that the Nation needs an authoritative coal commission which will have authority to ascertain the facts and, as occasion requires, promote conciliation or provide arbitration. It will be folly for the country to ignore the lesson of this strike when the exigency ends.

THE ROMANCE OF THE TENNESSEE MOUNTAINS

A GENERATION ago, when Mary N. Murfree wrote her romance of Tennessee, "The Prophet of the Great

Smoky Mountains," the emphasis in American short-story writing was being placed on local color. Mary Wilkins and Sarah Orne Jewett gave us the local color of New England; George Cable, that of Louisiana; and so over almost every section of the country. But the Southern mountains and the life and character of their people were then practically an unknown subject in fiction. It was before the time when John Fox had utilized the Kentucky mountains and before the same region had been treated, less dramatically but far more realistically and feelingly, by Lucy Furman in her "Mothering on Perilous," lately followed by her equally delightful tale, "The Quare Women," which again is most interestingly supplemented by Laura Spencer Portor in the current "Harper's Monthly" in her bit of reminiscence called "In Search of Local Color."

Miss Murfree really discovered a new field. She utilized it to the full from the romantic and the descriptive point of view in her first book. Yet the vigor of the book was such that her pen-name, Charles Egbert Craddock, was generally accepted at its face value and the author was believed to be a man.

Other novels followed "In the Tennessee Mountains" and "The Prophet of the Great Smoky Mountains," varying of course in ability and interest, but none attained anything like the popularity of the first two romances. The reason was that Miss Murfree, like many other writers of fiction, abandoned her natural line of writing and attempted to be over-subtle and to deal too philosophically with life problems. Even in her

best books she also inclined to rest too strongly on descriptions of marvelous scenery. She was often accused of hauling the moon over the Tennessee mountains too often and too lingeringly, and in one instance, if we remember rightly, of causing it to rise in a part of the sky never intended by nature for moonrise. One or two of her books attempted historical themes, but with no very great success. On the other hand, many of us remember with pleasure Miss Murfree's short stories, afterwards collected in book form; they reproduced the primitive and sturdy character of the Tennessee mountaineers as well as anything she did. Her stories for children were also of excellent quality.

Personally, Miss Murfree, who died in Murfreesboro on August 1, was a most interesting woman; her lameness led her in early life to devote herself to reading, and she had made a thorough study of the history of her own State. She was a direct descendant of Colonel Hardy Murfree, a Revolutionary officer of distinction, from whom the town in which she lived so long was named.

VISIBLE SOUND WAVES

A WEIRD phenomenon reported several times during the late war was the appearance in the sky during heavy cannonading of rapidly moving parallel arcs of light and shade. They were generally seen against a background of clouds, but sometimes they swept across the blue sky. These arcs were the sound waves from the discharge of the great guns, made visible by the varying refraction of light passing through the alternate zones of condensation and

rarefaction which constitute such waves in the atmosphere.

A phenomenon of similar character has sometimes been seen in connection with the explosive outbursts of volcanoes in eruption. The accompanying photograph was taken by Professor Frank A. Perret, the well-known vulcanologist, during an eruption of Vesuvius. Watching the cloud of smoke and dust above the crater, he observed that at each explosion a thin luminous ring flashed outward and upward from the volcano and disappeared in space. The movement of the rings was much more rapid than that of the material ejected from the crater. As their speed corresponded roughly with the speed of sound in the atmosphere (about one-fifth of a mile per second), there could be little doubt that they were, in fact, visible sound waves. Professor Perret named them "flashing arcs."

These swiftly moving rings were not bright enough to be photographed. In the accompanying picture they were added by Professor Perret himself after the photograph was developed.

"FLASHING ARCS" OVER MOUNT VESUVIUS

transportation industry is proportioned to the length of their service, should be placed in a position of inferiority to a limited number of men who have been employed as substitutes for these experienced railroad workers. The demand that such a wrong should be perpetrated as a penalty against men who have exercised a fundamental and admitted right not to render service under non-acceptable conditions was so unfair that we could not believe it would receive the sanction of any impartial judgment.

It seems to us manifest injustice that the striking railway men should ask for the full restoration of their seniority rights. Men "who have given four to forty years' service" should have thought of their seniority position before they entered upon a carefully planned enterprise to tie up the transportation of the country. The strikers felt that the wrongs they were suffering were so great that the only remedy was war. When a man makes war, he must take the consequences of his act. It was Emerson, we think, who said: "If you strike a king you must kill him." A man who strikes a blow, and when his blow, intended to cripple if not to kill, fails of its object asks to be taken back again into all the rights and privileges of the friendly relations which he has abandoned and attacked is, to say the least, not playing the game. Seniority rights in industry are given, as we understand it, for faithful, continued, and loyal service. No one recognizes more clearly and fully than we do the right of any man, who is not under a specified contract, to cease work whenever he chooses to do so; but no man can both have his cake and eat it. If he chooses to strike, he cannot at the same time

claim the rewards offered for not striking. If organized labor prefers the method of warfare to the method of arbitration for settling industrial disputes, it ought to be able to take the consequences of warfare without whining and complaint.

As reported in our news pages, the President has withdrawn his insistence upon the restoration of seniority rights and urges both sides to submit the disputed point to the arbitral decision of the Labor Board. If that body should decide for complete restoration, we cannot see that what the Portland "Oregonian" calls the moral issue of abandoning the loyal and rewarding the disloyal men will be any more justly settled than by the President's original request. What will probably happen, however, is that the Labor Board, if the managers and strikers ultimately consent to the new proposal, will find some way of compromise by which the loyal and newly employed workmen will have their rights reasonably protected and the returned strikers will preserve at least some of their seniority privileges, and thus the faces of all concerned will be saved. The great advantage of such an outcome is that the authority of the Railroad Labor Board in industrial disputes will be much strengthened. While the railway executives could not with self-respect, we think, assent to the President's first proposal, they may, we believe, consent to arbitration by the Labor Board, for the responsibility of the relations of the returned strikers to the loyal and new men in the railway shops will be shifted from their shoulders to those of the Labor Board.

THE RAILWAY STRIKE

ELSEWHERE in this issue the story is told of President Harding's proposal of terms of settlement of the railway strike, and the opinions of representative newspapers and several distinguished State Governors regarding those terms.

It is quite apparent that the President's proposal to restore unimpaired seniority rights to returning strikers is not generally approved by the country. The attitude of the Administration since the plan was published is one of the most telling evidences that it has made a mistake in urging the restoration of seniority. Inspired statements have been given out in Washington to the effect that the Administration regards the seniority question as of minor importance, and Secretary Hoover telegraphs The Outlook, in response to a request for the Government's reasons for advocating a restoration of seniority rights to the strikers, "We feel that a public statement in the nature you suggest probably would not contribute to the solution." The strikers themselves evidently do not consider that the seniority proposal is a minor matter. In telegraphing President Harding their acceptance of his proposals, the striking railway shopmen said:

It would certainly be a wholesale injustice of unparalleled extent if hundreds of thousands of experienced men who have given four to forty years' service, and whose value to the

There is one other aspect of the railway situation brought about by the present strike which we wish the railway executives would carefully consider. We have referred to it in these columns more than once. The people of the United States are never going back to the period of irresponsible private operation of railways. They will either require successful operation under Government regulation or they will turn to Government ownership and operation. Now we do not advocate Government ownership and operation. We think we realize its economic, financial, and political dangers; but the American people are getting restive; their patience is being exhausted by broken-down locomotives, dilatory trains, and bad shipment of freight. The managers may say that it is not their fault; that it is the fault of perverse and obstinate workmen. If, however, the railway executives cannot find a way to get on with their employees, the people, in spite of the dangers of bureaucracy, will

turn in impatience, if not in despair, to Uncle Sam. Their psychology will be that of a school board trying to settle a serious controversy between a school principal and his teachers and pupils. Controversy has thrown the school into disorder; teachers are disgruntled and pupils rebellious; the school principal asserts that it is not his fault; that he has made reasonable rules and regulations, and that the teachers and pupils will not carry them out. Perhaps his rules and regulations are reasonable, but somehow or other he fails to convince his subordinates and students of that fact. Finally, the school board says: "We are sorry, perhaps you have done the best you could, but we cannot have this school go on in this disorganized and inefficient fashion, and we are going to try another principal."

If railway strikes and disorganization continue, it is in this spirit that the long-suffering public will turn to Government ownership.

THE INVENTOR OF THE TELEPHONE

ALEXANDER GRAHAM BELL, who died at the age of seventy-five, on August 2, at his Cape Breton Island home, had only one possible rival to the claim of being the greatest American inventor of our time—Thomas Edison. It is said that in money value the telephone patents have never been equaled. When, on March 10, 1876, Mr. Bell's assistant, Thomas A. Watson, heard Bell's voice over the wire saying, "Watson, come here, I want you," the occasion was comparable with that of Morse's famous telegraph message, "What hath God wrought!"

Many of us remember our marvel at the telephone at the Philadelphia Centennial, but probably few dreamed of its boundless possibilities of expansion. Today in office and home the telephone has become a commonplace, but also a prime necessity. No doubt we could exist without it, but one can hardly conceive of the blow its removal would give to business and to prompt communication. One lifts his phone from the desk as naturally as he snaps on his electric light or turns his water faucet; its constant use has worn off the feeling that it is all but a scientific miracle, and even the wonder of wireless telephony is becoming ordinary. In many cities the telephone book has supplanted the directory. New York City has about a million phones; there are thirteen million in the country; the extension of the far-distance use of the telephone has gone on by leaps and bounds, and Bell's first

message to Watson was some time ago repeated from coast to coast between the two inventors. New appliances constantly aid the extent and facility of transmission, but it is hard to imagine that anything may ever supplant the telephone. Its growth has been by geometrical progression; each new thousand instruments put in has led to multiples of the original number.

It is rare that an inventor lives to watch the vast increase and usefulness of his contribution to human comfort and universal usefulness as Dr. Bell lived. He was not thirty years old when the basic patents of the telephone were issued, so that for forty-five years he enjoyed recognition and the practical fulfillment of the youthful dream of his young genius. There were two rival claimants, but neither established priority; as with many other scientific discoveries, more than one mind was working on the same problem.

Dr. Bell was neither a financier nor an industrial promoter. He was by nature a scientist. Oddly enough, he did not approach his great discovery from the electrical side. Like his father before him, Dr. Bell was strongly interested in aiding deaf-mutes, and out of his special knowledge of acoustics and the human ear grew his experiments in transmitting sound. He once said:

I now realize that I never should have invented the telephone if I had been an electrician. What electrician would have been so foolish as to try any such thing? The advantage I had was that sound had been the study of my life—the study of vibrations. I confess I do not understand to-night how a man can talk in Arlington, across the river from Washington, and a man on the Eiffel Tower, in Paris, hears him. I dare admit I blazed the way, but the great discoveries and developments that followed called for the correlation of many minds.

It must not be thought that Bell was a man of one idea; he was a searcher in many directions; he contributed to our knowledge of aeronautics; of the photophone he spoke in a recent magazine article as scientifically the most promising of his discoveries; his telephone probe was used in finding the bullet that killed President Garfield; he has made novel suggestions as to household economy in heat. His spirit of inquiry and helpfulness remained active all his life.

The achievement, vision, and personal buoyance of this great inventor are an exposition of much that is strongest and most admirable in American character. There is no need of a statue in any Hall of Fame to insure Bell's pre-eminence in the realm of invention.

SENIORITY AND THE RAILWAY STRIKE

A RÉSUMÉ OF PUBLIC AND OFFICIAL OPINION

ON August 1 Secretary Hoover, of the Department of Commerce, personally presented to a conference of railway executives in New York a letter from President Harding containing the following conditions for a settlement of the railway strike:

PRESIDENT HARDING'S PROPOSAL

First—Railway managers and workmen are to agree to recognize the validity of all decisions of the Railroad Labor Board, and to faithfully carry out such decisions as contemplated by the law.

Second—The carriers will withdraw all lawsuits growing out of the strike, and Railroad Labor Board decisions which have been involved in the strike may be taken, in the exercise of recognized rights by either party, to the Railroad Labor Board for rehearing.

Third—All employees now on strike to be returned to work and to their former positions with seniority and other rights unimpaired. The representatives of the carriers and the representatives of the organizations especially agree that there will be no discrimination by either party against the employees who did or did not strike.

The railway executives at once accepted the first and second conditions, but declined to accept the third on the ground that to take the strikers back without any impairment of their seniority rights and privileges would be unjust to the men who remained at work and to the new men who have been employed.

For nearly two weeks discussion has raged about the word "seniority." Are seniority rights important, and, if so, is it just to restore the strikers to their old jobs with their seniority rank and privileges exactly as they were before the strike?

In order to get the facts upon which an intelligent answer to this question may be obtained The Outlook sent an identical telegram to the Governors of the forty-eight States of the Union and to a selected list of daily newspapers in the Middle West and Pacific States, asking for the sentiment of their communities on the President's plan and the proposal to restore the seniority rights of the strikers.

THE TELEGRAM

What is your opinion and what is public sentiment in your community regarding the President's proposed settlement of the railway strike, especially his treatment of the seniority question. A telegraphic answer collected will greatly oblige The Outlook.

August 2, 1922.

The Governors appear to be rather cautious about touching a question which may involve a delicate political situation. Telegraphic answers have

been received from seven of the forty-eight, and those seven, we are happy to say, are illuminating and valuable. Their telegrams read as follows:

FROM THE GOVERNOR OF LOUISIANA (PROGRESSIVE DEMOCRAT)

I do not see how with honor railroad companies can reinstate men who left their employ with full seniority rights after their places have been filled. In my judgment, the general opinion is against President Harding's decision.

JOHN M. PARKER,
Governor.

Baton Rouge, Louisiana, August 2, 1922.

FROM THE GOVERNOR OF PENNSYLVANIA (REPUBLICAN)

While I fully understand the President's anxiety to end the shop craft strike upon the railroads, I cannot [but] feel that to ignore the question of seniority of faithful employees and those who have risked their safety by accepting employment during the strike will put a premium upon future strikes and will encourage disregard of the Labor Board's decisions. The men who struck did so against the ruling of the Governmental authority in which regulation of labor questions is placed by law, and if any body of men may with impunity tie up the transportation system of the country and imperil the public welfare the Federal regulation of the railroads is unsuccessful. I believe this is the general sentiment among those who have given the matter any thought.

WILLIAM C. SROUL,
Governor of Pennsylvania.

Harrisburg, Pennsylvania, August 2, 1922.

FROM THE EXECUTIVE OFFICE OF GOVERNOR SHOUP, OF COLORADO (REPUBLICAN)

Governor absent. Public sentiment is not yet pronounced regarding President's proposed settlement of railway strike. Railway operation in this section fairly satisfactory.

E. R. HARPER,
Secretary.

Denver, Colorado, August 3, 1922.

FROM THE GOVERNOR OF NEBRASKA (REPUBLICAN)

I assumed that the President and his Cabinet had gone carefully into all of the facts relating to the railway strike before making his proposal, and on this assumption I was hopeful that it would be accepted by both parties. I recognized, however, that if employers are to maintain discipline in their organization and treat fairly with all employees they must have rules to which they can rigidly adhere. Seniority, when it is justly applied, is as beneficial to the employees as to the employer, and should therefore be regarded as a factor in contractual agreements between employer and employee that should not be waived to the detriment of either party.

SAMUEL R. MCKELVIE,
Governor.

Lincoln, Nebraska, August 3, 1922.

FROM THE GOVERNOR OF OHIO (REPUBLICAN)

It is my belief that President Harding is doing everything in his power to settle the railroad strike. It is still to be hoped that his efforts will meet with success. Not knowing all that transpired in his conference with both railway workmen and employers, I do not feel called upon to pass judgment on the action he has taken. I have every confidence in his ability and honesty of purpose in the tremendous task that is before him in this attempt to bring these two great forces to an amicable agreement. The people of Ohio are patiently awaiting the final outcome of the efforts the President is now putting forth to advance the best interests of the entire country and are sanguine of success.

HARRY L. DAVIS,
Governor of Ohio.

Columbus, Ohio, August 4, 1922.

FROM THE GOVERNOR OF ARIZONA (REPUBLICAN)

Sentiment in Arizona favorable to President's proposed settlement of railroad strike. Seniority question not generally understood and little discussed. Personally I feel the President's plan is fair and square. A firm application of the big stick right now will bring results. No disorder in Arizona, and there will not be.

THOMAS E. CAMPBELL,
Governor.

Phoenix, Arizona, August 4, 1922.

FROM THE GOVERNOR OF KANSAS (REPUBLICAN)

There are certain fundamental issues involved in this strike, and these should not be ignored for the purpose of forcing a settlement. The men who refused to accept the decision of the Federal Labor Board followed this refusal by an effort to paralyze the transportation facilities of the country. They showed respect neither for the law which created the labor tribunal nor for the public whose welfare was dependent upon the continuance of transportation. They deliberately set their judgment against the two-thirds decision of the judicial tribunal and sacrificed their seniority rights with full knowledge that their refusal to abide by the Labor Board decision would terminate these rights with their companies. The companies guaranteed a square deal to the men who remained at work and to those who came in to help meet the emergency. To require the companies to break this pledge to the new men would be to advocate bad faith. While the public is deeply concerned for the settlement of the strike and will stand behind the President in every fair effort he makes, they feel that the honor of the Government should not be compromised, the dignified effort of the Labor Board entirely thrown away, nor the rights of the men now at work to a square deal deliberately ignored. They feel now that the only course left is for the President to urge

GOVERNORS WHO ANSWER THE OUTLOOK'S QUESTION

an amendment to the Railroad Labor Board Law giving to that Board the power to enforce its decision.

HENRY J. ALLEN,
Governor.

Topeka, Kansas, August 3, 1922.

THE ADMINISTRATION'S VIEW

Quite as significant, perhaps, as these interesting gubernatorial telegrams is the opinion of the Administration itself. When telegraphing to the Governors we addressed the following despatch to Secretary Hoover:

August 3, 1922.

Hon. Herbert Hoover,
Secretary of Commerce,
Washington, D. C.

Will you send us by telegraph collect for our information and unless you forbid for printing under your name statement of Administration's reasons for restoring seniority rights to railway strikers?

THE OUTLOOK COMPANY.

To this request Mr. Hoover sent the following telegram:

Washington, D. C., Aug. 4, 1922.

The Outlook Company.

We feel that a public statement in the nature you suggest probably would not contribute to the solution.

HERBERT HOOVER.

NEWSPAPER OPINION

The following telegraphic replies were received from a number of representative newspapers in response to The Outlook's request. The Charleston (South Carolina) "News and Courier," an able and conservative reflector of Southern thought, thinks that the President is too late:

The fatal defect in President Harding's plan was that it came at least three weeks too late. If he had acted promptly, as he should have done, a settlement could have been effected early in July. After waiting until the Labor Board had declared the strike an outlaw strike, and until after the railroads had been encouraged, acting under this declaration, to employ new workers to take the places vacated by the strikers, the right acquired by these new workers and by the men who remained loyal cannot be brushed aside or disregarded as the President's plan suggested.

"THE NEWS AND COURIER."

The Cleveland (Ohio) "Plain Dealer," a reasonable representative of Republican opinion in the President's own State, wishes to leave the seniority question to the Labor Board itself:

The Labor Board has all the facts

involved in the controversy. It is the representative of the public and the Government in this dispute, entrusted with the responsibility of making fair and equitable adjustments between capital and labor employed in the transportation field. The Transportation Law provides special means by which controversies must be brought to that agency for adjudication, but in a National emergency of this kind technicalities might well be waived and the President as responsible leader in this matter ask both groups to end the strike and to resume operations on the basis of conditions existing either when the strike was called or those laid down in the recent ruling of the Labor Board, pending its decision on the seniority as well as the wage question. Such an agreement would end the strike at once, which is admittedly the main consideration, and would go far toward establishing the Labor Board as a Government agency for preventing interruption of transportation service in the future. "PLAIN DEALER."

The Chicago "Evening Post," an independent journal that has influence with the best class of intellectual opinion, wonders what induced the President to take so unfortunate a step:

No argument, aside from that of

Bain

Bain

WILLIAM C. SPROUL, OF PENNSYLVANIA

GOVERNORS WHO ANSWER THE OUTLOOK'S QUESTION

public need, can be offered against the contention that justice demands the protection of the men recently employed by the Railroad Companies as well as those who remained loyal when the strikers quit work. Whether public need is sufficient reason for setting aside this obvious requirement of fair dealing may be open to discussion. We are inclined to think some other way of meeting public need must be found. Men who deliberately choose industrial warfare as a method of obtaining their ends should be required to accept the consequences of the method. We may be prepared for the time to tolerate the strike as a legal means of controversy, but we are under no obligation to free it from all risk of loss to those who adopt it. The situation is unfortunate from the standpoint of the country, and there will be a good deal of wonderment as to what considerations induced the hope in the President's mind that his threefold proposal would be acceptable to the railroads.

"POST."

From Minneapolis the "Tribune," highly regarded in the progressive State of Minnesota, expresses its amazement at the President's proposal:

The "Tribune" is constrained to confess its amazement at the President's plan to bring about a settlement of the shopmen's strike. Like a great many others, we are at a loss to understand the thought processes by which the President arrived at the seniority proposals he made the railroad executives. On the word of the Labor Board the railroads promised permanent positions to all men who stayed at work or who came to work. The good faith of the railroad executives, as well as of the Labor Board, was pledged, rightly or wrongly. Yet in the face of this patent fact the President asks for a repudiation on the part of the executives, which repudiation would also be disobedience to the Labor Board. As matter now stands we do not see how the members of Labor Board can continue to hold office.

MINNEAPOLIS "TRIBUNE."

The Omaha, Nebraska, "Bee," strict in its Republicanism, a competitor and rival of Senator Hitchcock's newspaper, the Omaha "World-Herald," widely read but hardly so influential with independent readers as in the days of its eminent founder, Victor Rosewater, Sr., is proud of the President:

Originating as a labor dispute, the shopmen's strike has become a Governmental problem. The President, who bided his time, has now made a final emphatic declaration which reveals him to the very men who cast suspicion on his motives, as the spokesman, not for any class, but for the whole people and the higher good. To those who have shown their faith in the President this is a proud moment. It is a time for rejoicing on the part of all Americans who set the general welfare above special privilege to any class. OMAHA "BEE."

In the Rocky Mountain region no

newspaper is more respected than the "Idaho Statesman" of Boise, Idaho. Its telegram is succinct and effective:

The railroads are running by help of men who remained on the job and by new ones promised permanent positions by open letters from the Presidents of the railways. If the railroads yield on the seniority question, the roads will not run when the next strike occurs. We think the President's action unwise.

"IDAHO STATESMAN."

The three Pacific Coast States—California, Oregon, and Washington—evidently have very definite opinions on the seniority question. Three strong newspapers of that region, all Independent Republican in their political sympathies, have telegraphed us their views. The Los Angeles, California, "Times," which has long had a reputation as a fearless fighter for what it believes to be the rights of the public in labor controversies and has sometimes suffered physically in consequence, wires The Outlook as follows:

We feel that the railroads were right in keeping faith with the men employed in positions left vacant by strikers. The strikers abandoned their seniority with full knowledge they were doing so when they abandoned their jobs in an attempt to embarrass the conduct of traffic. The men who took their places did so in good faith, in the face of danger, and in pursuance of their Constitutional right to sell their labor as free men. The suggested compromise, if adopted, would make their jobs untenable. For the railroads to thrust them aside in favor of the strikers would be the depths of dishonor, and if continued as a systematic plan in future strikes would result in industrial disaster. The certain result of the proposed compromise would be to strengthen the closed shop everywhere and encourage future strikes.

THE LOS ANGELES "TIMES."

The proprietor of the Spokane, Washington, "Spokesman-Review" has for many years been a supporter of the social and political policies of Theodore Roosevelt. The telegram of the "Spokesman-Review" indicates that it regards the seniority proposal made to the railway executives as a violation of "the square deal:"

It is apparent that the negotiations broke down because the heads of the railroads could not bring themselves to acceptance of the injustice of returning the strikers to their old positions with seniority rights over the loyal men who stood by the railroads and the public. To do that would set a premium on striking and a penalty on faithfulness, the railway chiefs contended, and to that conviction there is no adequate answer. The nearest approach to it was the argument presented by Secretary Hoover that the Administration considers that maintenance of the authority of the Labor Board far transcends the principle of seniority. At the moment it is im-

possible to forecast public opinion on the clear-cut issue thus raised by the refusal of the railway executives to yield their convictions of duty to their loyal employees. It is difficult not to sympathize with them in their dilemma.

"SPOKESMAN-REVIEW."

Lastly, the Portland "Oregonian," for forty years a defender of high social, economic, and political standards on the Pacific coast, points out in its telegram that the seniority question involves, not an industrial, but a moral issue.

Seniority, in our understanding, involves the right of shopmen who by their own acts and statements and by pronouncement of an arm of the Government—the Labor Board—have ceased to be employees of the railroads. It involves the right of ex-employees to return to their positions and oust men employed on the representation that they were performing a patriotic service, and employed also with the widely advertised promise that their positions would be permanent and that they would be protected by the Government therein. From the moral standpoint, it matters not whether these new men are as desirable mechanics as the men who have lately quit their jobs. Bad faith is bad faith. It is not rendered less obnoxious by the facts that it is advocated by so exalted a person as the President of the United States and that it is directed against citizens of lesser importance and influence. The public is probably not yet fully aware of the significance of seniority rights. When it is, we are confident that it will support the moral side of the issue.

"OREGONIAN."

The foregoing expressions of official and public opinion are not, of course, from every political party or every geographical section of the United States. But they are sufficiently representative, we think, to indicate a very strong and influential opposition to the President's first seniority proposal.

On August 7, after the receipt of the telegraphic comment here printed, President Harding issued another call to both railway executives and railway strikers urging them to submit the disputed question of seniority to the Railroad Labor Board, thus receding from his original position of insisting upon the restoration of seniority rights unimpaired. The Railroad Labor Board by formal resolution has expressed its willingness to adjudicate the question of seniority rights if that question should be submitted to it. Both executives and strikers have expressed dissatisfaction with the new proposal—the strikers evidently and naturally preferring an absolute provision made by the President in their favor to an arbitration by the Labor Board; and the executives taking the ground that if the restoration of seniority is inherently unjust a decision by the Labor Board cannot make it any more just than a decision by the President.

The Outlook's views will be found expressed in an editorial on another page.

AN AMERICAN MONUMENT TO ENGINEERING SKILL

International

BROOKLYN BRIDGE AS SEEN FROM THE TOWER AT THE BROOKLYN END

When the New York City Commissioner of Docks and Bridges declared the other day that one of the cables supporting the Brooklyn Bridge was slipping and that the bridge might have to be rebuilt or replaced, the people not only of New York but of the Nation suddenly remembered what most of them had forgotten—that in this bridge they possess one of the greatest and most beautiful structures in the world. Not even the skyscrapers that have shot up since it was first built have impaired its dignity. The alarm about it is needless. Engineering authorities pronounce it perfectly safe. To lessen the strain upon it there may be some changes in traffic to reduce its "live load;" but its strength, like its dignity, remains unimpaired.

A EUROPEAN MONUMENT TO PATRIOTIC SACRIFICE

Wide World Photos

THE CEREMONY AT THE DEDICATION OF A MEMORIAL TO THE FIRST VICTIM OF GERMANY'S AGGRESSION

People's memories are short. Eight years ago France at this time was withstanding almost alone the shock of the massed troops of the Central Empires, which, if successful, would have made Germany as ruthlessly despotic a power as ever was Assyria or Babylon. To-day this has apparently passed out of the minds of many men who would be paying taxes to German tax-collectors except for what France then did—and did practically alone. The first man to fall in that onslaught was a French corporal, André Peugeot by name. Where he fell, at Jonchery, in Belfort, a monument has been erected, and, as pictured above, recently dedicated

STATESMANSHIP RUN WILD

BY CLIFFORD ALBION TINKER

CANUTE, mighty statesman and king, at the summit of his power ordered a seat to be placed for him on the seashore when the tide was coming in. Thus seated, he shouted to the flowing sea: "Thou, too, art subject to my command, as the land on which I am seated is mine; and no one has ever resisted my commands with impunity. I command you, then, not to flow over my land, nor presume to wet the feet and the robe of your lord."

The tide, however, continuing to rise, dashed over his feet and legs without respect to his royal person. And the tide still rises and falls, while the proud conqueror of England, Denmark, and Norway has been dead these nine hundred years. Two years ago I stood looking at a mortuary chest on top of the parclose screen between the choir and altar of Winchester Cathedral, England; in that chest were the bones of Canute. The very next day after gazing at the box of royal bones, when I desired to take ship from Southampton to France, I found the tide rushing into the shipping basin with a powerful current, swift and strong enough to require special cables hitched to special buoys to assist the ship in turning outward toward the sea.

Canute, by an accident of birth, remains as an ossified relic—the tides are mocking, treacherous, they go on forever. Thus does nature rebuke kings and statesmen. The great Danish-Slav knew all this. His seeming foolishness was intended to be a wisdom lesson to his nobles and his successors for all time. But, alas! we flaunt the wisdom of our fathers.

Canute-like, the Allied leaders and statesmen, after the armistice, by restricting commands ordered the German mind to cease thinking, at least along aeronautical lines. Their success about equaled that of Canute with the tides. They had not learned his lesson. The combined intelligence of seventy million people is a mighty factor in human affairs; the mental processes of such a multitude cannot be controlled by alien specification, nor yet by alien regulation.

Hence the Germans, despite the power of the Allies, while not openly braving the restrictions, secretly continued their

Official Photo Nat. Adv. Comm. for Aero.

This extraordinary contrivance afloat in the air is Klemperer's glider. At the time when this picture was taken Klemperer was making a record flight without engine, propeller, or any means of propulsion except the imitation of the flight of birds. His record flight at this time lasted 12½ minutes and covered 8½ miles. This illustrates the way in which the Germans have turned their skill toward intensive aeronautical research under the restrictions imposed upon them concerning aircraft

efforts in the development of aviation until they have outdone the eagles of the air. German bird-men, in flying-machines lacking motors, lacking propellers, lacking gas, have flown for miles at high altitudes, have cut circles and figure-eights, have taken off, and after zigzagging all over the Rhone Valley have returned to the exact spot they left to make their landings. If this is not stealing the secrets of gull and eagle, what is?

Denied the opportunity of building aircraft, denied the right to purchase machines and engines abroad, the Germans were forced to turn their skill and enthusiasm toward intensive aeronautical research. They were successful almost beyond comprehension. The Germans have turned to gliders. It was the study of gliding experiments that furnished the Wrights with their data for building successful airplanes. Now the Germans, by combining the knowledge of early gliding experimentation with the knowledge of flying and wing and

fuselage construction gained since the epoch-making flight of the Wrights' first plane, on December 17, 1903, have built new and stable gliders, and with them have accomplished soaring and gliding flights which equal, and in some respects excel, the performance of huge birds.

At first the Allied officers looked upon this gliding activity as a mere schoolboy craze. This idea found reasonable basis in the fact that the experiments were carried out under the auspices of the various technical high schools, akin to our technical colleges, and that the fliers were in most instances youngsters. But as record after record fell and some of the participants were experienced and skillful aviators, a class which seemed to be growing, the Allied officials took cognizance, and then became alarmed. In fact, at each new record they got an international chill.

This state of affairs, together with certain suspicious doings among the German aircraft manufacturers, brought about a more serious regulatory hampering of the German aeronautical industry. When the full record of soaring flight became known, and it was found that Klemperer had made a glider flight of thirteen and one-half minutes, Martens one of fifteen and three-quarter minutes, and Harth had flown twenty-one and one-half minutes, the whole German aircraft scheme was practically wiped off the slate by a command to cease entirely the manufacture of anything which could be used in, on, or in connection with aircraft. This regulation was promulgated by the Allies on May 5, 1921, and was to remain in force until

Photo. by courtesy of Paris Office N. A. C. A.

This is the way Klemperer's queer contrivance looks as it rests upon the ground. The undercarriage of the usual type in airplanes is here replaced by two padded buffers. Instead of using a catapult to launch the glider, the inventor has ropes attached to the body by means of which running men are able to get the glider off the ground just as a small boy raises his paper kite in the wind

a new set of regulations could be produced which would allow certain aircraft to be built and flown in Germany, but which would confine such activities to commercial aircraft alone.

The result of this dictum was a boomerang which has done wonders for German aviation and placed the Allies in the position of having defeated their own purposes. Not only have the Germans retaliated by discriminatory regulations of their own, which make German aeronautical practice a closed book to the Allies, but they have gone to Holland, Switzerland, and Russia with their men and money, and have thus nullified Allied control. If the Allies were right in their original contention—that is, that aircraft in German hands constitute a menace to the peace of Europe and the welfare of democracy—this last action by Germany certainly contains the seeds of calamity. Germany alone might prove a difficult problem; Germany allied to Russia becomes a menace.

Signs of impending German alliances with capital and industry in outside countries began to appear in the summer of 1921, and the Allied control committees hastened to perfect regulations which should relieve the situation; but this move came too late. As a matter of fact, the Allied control of German aeronautics has passed from blunder to blunder, until one begins to wonder just how far international imbecility can go. With the present scheme of Allied control, which took effect on May 5, 1922, it can be taken for a grave certainty that the end is not yet.

An old fallacy, deemed to be axiomatic by certain French officers who ought to know better, is responsible for this chaotic jam in German aviation. The silly and harmful claim was advanced at Paris that a commercial air fleet can be turned into a war fleet in the course of a few hours, therefore Germany must be prevented from building commercial aircraft. How is it that distinguished officers, diplomats, and statesmen cannot understand, even with the novice in military and naval aviation, that, although a large commercial machine can be turned into a bomber without much difficulty, an entire fleet of such bombers would be utterly at the mercy of a small force of fighting machines unless the bombers were accompanied by fighting machines of their own? Let the Germans build commercial machines—the bigger the better, for they would thus be certain prey for fighters—but restrict the building or purchase of fighting craft.

Instead, the Allies restricted machines of large size, but permitted the building of small, low-powered, short-range planes—that is, since May 5, this year. This has resulted in the production of a small plane with a wing spread of less than thirty feet, with an engine of fifty horsepower, all metal, which can carry three persons in addition to the pilot, and at a speed in excess of one hundred and thirty miles an hour! And this is sup-

Official Army Air Service

Here is another German contrivance. It is the "Dragon-Fly," an all-metal sporting type of seaplane, built by Dornier, of Germany. It has folding wings for space-saving storage and for ready transportation to and from the beach. Low cost and high performance characterize planes of this type. This design was perfected during the months when the Allies' restriction on Germany was at its worst

posed to be a commercial airplane! By their own regulations and restrictions the Allies have been the means of giving Germany the most efficient fighting plane known! Leave out the passengers, provide ordnance, thus reducing the load and gaining fighting equipment, and this new monoplane becomes a war machine *par excellence*.

A little inside history, which now may be told, in connection with the May 5, 1922, pronouncement of the Allied Council of Ambassadors for the purpose of maintaining an aeronautical supervision in Germany to replace the Interallied Aviation Control Commission: The text of the new regulations was forwarded to our State Department for action in October, 1921, obviously with the hope that we would join the Allies in its approval and enforcement. The paper in question was sent by the State Department to the Chief of the Army Air Force, the National Advisory Committee for Aeronautics, and to Admiral William A. Moffett, Chief of the Navy's Bureau of Aeronautics, for comment and recommendations.

A remarkable document this pro-

nouncement proved to be. It contained provisions for the makeup of the Guaranty Commission, which, by the way, was to be headed by a high-ranking British Air Force officer, instead of a French officer, and to consist of three other British officers, three French officers, two Italian officers, and two from Japan and two from Belgium. This group was to be established in Germany, with headquarters in Berlin. This Commission was to have the power, according to the text submitted, to go anywhere in Germany at any time to inspect aircraft and their manufacture and operation, and this for a period of eight years, at the end of which period the situation will be examined with a view to future decision.

During the eight years the Commission is to have the full co-operation and assistance of the German Government, to be provided with diplomatic privileges, to be suitably housed and the property occupied to be given extra-territorial status, to be furnished with required liaison officers, and to be guaranteed that no efforts will be made or steps taken of any kind to hinder the operation of the Commission in any manner whatsoever. One evidence of sanity was noted in this paper: the Allies will pay the salaries and expenses of the Commission.

In addition to carrying out the provisions and restrictions embraced in the Versailles Treaty, the Commission will guarantee the nine rules for the discrimination of military and civil aircraft. These rules are particularly interesting, inasmuch as they define what France and England, the other Powers consenting, consider to be military aircraft—that is, in the hands of a potential enemy; just what they would subscribe to in the way of rules restricting the character of commercial aircraft within their own industries might be another story.

Briefly summarized, these nine rules provide: That any monoplane having more than sixty horse-power will be considered a war plane, and therefore war material. Any aircraft capable of flying without a pilot will be given the same rating—this precludes radio control of aircraft in Germany. Any aircraft having armor or means of self-

Official Army Air Service

This also is a Dornier plane. According to the builders, this all-metal transport plane "should especially be suitable for air transport in countries not yet fully opened up." This is significant. In view of German activities in Russia. The 1922 model here pictured is on the wily edge of the regulatory specifications

protection or being capable of having sighting devices installed is also military. No plane may have an allowable ceiling in excess of 4,000 meters, and no supercharging system for motors may be carried.

Planes may not exceed a maximum speed, with full load at an altitude of 2,000 meters, of 170 kilometers an hour, and the amount of fuel and lubrication oil to be carried is limited, so that the extreme range of action will not exceed 470 miles. And, further, no heavier-than-air machines will be allowed which carry a load in excess of 252 pounds (600 kilogrammes), whether or not the conditions of the foregoing rules are complied with. This load includes the pilot, mechanic, fuel, and instruments.

With respect to lighter-than-air craft the rules are even more stringent, Germany being the real home of airships. No engines may be used which will give the airships a speed in excess of 60 miles an hour. Rigid airships must not exceed a gas capacity of 1,000,000 cubic feet, less than half the size of the famous R-34. Semi-rigid airships must not exceed 800,000 cubic meters, or two-thirds the size of the Roma; while non-rigid airships (blimps) shall not be larger than 700,000 cubic feet. These restrictions hit the German airship industry a body blow.

In addition, all factories manufacturing aviation material must be declared; all pilots and students must matriculate under the rules of the Commission; and the Commission will determine the needs of German civil aviation. This last means that the Allies control the number of planes and motors which Germany may have for commercial use for the next eight years.

Admiral Moffett, with characteristic statesmanship, often manifested by the officers of our Navy, declared that the United States could not be a party to such discriminatory regulations. First, because this country could not define the military and naval status of aircraft within such narrow limits. The whole science of aeronautics and the art of flying being in too much of a condition of experimental flux, we might, within

Official U. S. Army Air Service

Certainly the Germans are ahead of most nations when it comes to attractive and comfortable fittings on passenger aircraft. This cabin interior of a 1922 model seaplane of the Dornier all-metal type is certainly inviting. Let's go!

a short time, find our regulatory birds coming back to roost.

Secondly, Germany having been one of the foremost nations in the development of aeronautics, and possessed of abundant engineering talent, should not be held down so materially; otherwise the development of commercial aviation, so necessary to present-day commerce where time is a tremendous factor, will be retarded and hindered to the great economic disadvantage of all nations using aircraft.

Thirdly, the fact that Germany is the only real barrier between western Europe and the onward rush of the Slavonic advance guard of yellow Asia makes it imperative that Germany be allowed to maintain an air fleet for the common defense of Western civilization. Hence the regulations, as laid down, defeated all thought of the immense advantages of an air force sufficient to absorb the first shock of an Asiatic invasion.

Fourthly, if the restrictions embraced in the communication should be carried

out with honesty, then Germany would feel it a necessity to take her aircraft industry to other countries, and such a course would at once throw the whole matter of Allied control into chaotic inefficiency.

Our Army authorities and the Advisory Committee concurred with Admiral Moffett, and this country refused to become a party to the control of German aviation along the lines indicated. The Council of Ambassadors, however, approved the rules, and the Commission took office on May 5, last.

It now appears that Germany has done just what Admiral Moffett feared. Instead of a buffer against the possible invasion of Slav and Mongolian, Germany is bound to those elements by treaty and is utilizing Russia's enormous supply of raw materials and cheap labor to manufacture aircraft on a grand scale for any use which may be desired, military, naval, and commercial. Of what avail are the rules governing size, speed, carrying capacity, and type?

Official Army Air Service

Here is another view of a Dornier all-metal plane. It illustrates the strange new forms which are coming to light in the German effort to meet the Allied control requirements in aircraft design and manufacture. It is a single engine plane and is, it is reported, a new step in airplane economies

None whatever. Not being able to build "bricks without straw," Germany has gone where such commodities are limitless. Moreover, a revengeful spirit may find it possible to carry out retaliatory measures to the full, and thus visit on the Allied nations a sore rebuke for official persecution.

Already commercial aircraft lines are in operation from Berlin to Scandinavian ports, to the Baltic States, to Poland, and to Russia. Copenhagen, Malmö, Stockholm, Reval, Riga, Memel, and Dantsic are linked up by air, while lines from Berlin via Dresden reach Breslau, Warsaw, and contiguous territory. Other lines are operating between Dantsic and Königsberg and extend to Kovno, Smolensk, and Moscow. Still others are in process of completion from

Reval to Petrograd and important points between.

This would cause no adverse comment if we were sure of Russia, but that virile and unawakened nation is in the grip of the foes of organized civilization as we know it; thus the Slav is an unknown quantity. Germany we know; hence our anxiety. The Allies are of course worried; yet they persist in carrying on, they continue useless and irritating control, they grimly stick to their regulatory guns.

What will come of it all is anybody's guess. One thing is certain, however, and that is that Germany is determined by hook or by crook to have all the aviation she wants, and it appears that she is getting it by, to use a trite expression, leaps and bounds.

As for the left-handed alliance simmering away in the depths and darkness of that land which hurled back the might of Napoleon, the alliance which binds together the supposed two extremes of republican government in Europe—why, anything can come from that alliance. Should disaster to the peace of Europe and danger to world civilization come from it, we may chalk the whole business down among the fretful and irritating gunboils of Allied diplomacy—otherwise European diplomacy—with which the book of time is replete, but which, however, like all such mistakes and blunders, will be swept aside in the onward march of civilization toward the goal of rational thinking, rational living, and—save the mark!—rational diplomacy.

SOMEWHERE ELSE FOR A DOLLAR A DAY

BY J. C. LONG

EVER since the days of Mr. Wells's red-eyed cave man the human species has wanted to be somewhere else. Whether pressing in hordes across the north of Europe, sailing on the unknown Atlantic of Columbus's time, or driving in caravans over the Western plains, man has been on the move.

The organization of modern life has checked the ease of pulling up stakes continually, but the development of the modern automobile has enabled the human creature to continue to satisfy the craving for travel.

The cold weather of winter and the exigencies of business keep the worker pretty much tied down for most of the year; but when summer with vacation comes, the romantic desire to see what lies over the hill asserts itself, and hordes of motorists take to the broad highway.

For many years touring was the sport of the prosperous. To-day one still may travel like a king, but the privilege is no longer exclusive. Low-priced cars, low cost of equipment, coupled with good management on the part of the tourist, make motoring a recreation at the command of the moderate purse. There are camp sites everywhere, most of them free, others making a small charge, such as fifty cents a night. In short, the car owner of 1922 who feels the urge to be moving on can readily be "somewhere else" at an expense of about a dollar a day.

It is assumed that the man who wishes to keep his budget within this figure does not expect to have Statler service nor meals created by Oscar. He will be his own Robinson Crusoe and his own Man Friday; but the meals and equipment suggested here have borne the test of experience, giving health, pleasure, and the sense of getting as closely back to nature as is humanly possible.

The dollar-a-day camper first thinks of those things which he can do without. On a "roughing-it" campaign he can readily dispense with butter, bread, and milk. He is not going to carry an ice-chest, which rules out the tutter and milk at once. He will not have the space for bread, which grows quickly stale.

This does not mean that he will have to sacrifice any food values. Whole-wheat crackers and hardtack will take the place of bread. To one who is sitting at a desk this may seem like pretty dry fare; but after a few hours' drive in the breeze or after a night's sleep in the open the appetite becomes less finicky.

Crackers; to be sure, are merely the base of the meal, not the whole menu. Soup is a good first course. A plentiful supply of canned soup can be readily stored in the car; but it is advisable to choose a thick kind, such as vegetable, for in it is concentrated nourishment. Consommé, for instance, may be appealing in the dining-room, but it makes thin rations around the camp.

Canned beef is good for those who can eat it without future trouble, but the average camper does better on other fare. It is safer to carry tins of bacon. Crisp bacon is decidedly tasty, and it supplies a fat content which is missing from the menu when butter is eliminated.

Powdered coffee, or tea or cocoa may be carried according to the family preference, and evaporated cream can be used instead of milk.

The element of fresh greens remains to be supplied in this bill of fare. Some campers may not miss it; but those who do need not worry. Around every camping reservation there are hucksters who seem to have a genius for finding out where there may be any business.

Salt and sugar must of course be included in the supplies.

With the food question comes the mat-

ter of cooking. Building a fire is usually good fun, but it is a dangerous occupation for the amateur camper. Thousands of dollars' worth of timber are destroyed every year because of the carelessness or ignorance of campers in building fires. It is better to carry a Theroz or Sterno canned alcohol kit, such as can be purchased from the Boy Scouts' headquarters in New York. Several dollars' worth of the alcohol cubes will last a family of four for two weeks or more.

Provision must also be made for sleeping. In some cars the front seats fold down or are removable, so that the vehicle can be turned into a bed for two. But a group of four would need at least one extra shelter tent. Such tents are very inexpensive and have the advantage, since they have no poles, of folding up into a small space, so that they can be readily carried on the running-boards.

The tents may be erected by stretching ropes from the top of the car to near-by trees. Care should be taken to have the pins driven deep to attach the canvas close to the ground. The site chosen should, if possible, allow of drainage away from the tent in case of rain, and should be, so far as circumstances will permit, on gravelly or porous soil. In any event, it is advisable to dig a shallow trench around the tent to carry off moisture.

A rain-coat with blanket spread over it will form a mattress. Some campers and the weight of tradition recommend cedar boughs for a bed, but the art of sleeping on them will have to be acquired. Some motorists prefer to sleep in hammocks, a satisfactory method when there is no rain. In summer-time a rain-coat and a pair of blankets for each person and sufficient tents should care for the sleeping equipment.

A medical kit should always be carried. This should include a Red Cross first-aid outfit. In the absence of a

physician, it is well to have on hand cascara or castor oil; spirits of camphor, to be taken internally in small doses in case of diarrhoea, which is likely to develop from change in drinking water; epsom salts, to remedy ptomaine poisoning; and mustard for external applications in case of cold.¹

A spade should be carried for sanitary purposes.

The question of cutlery, plates, and napkins can best be determined by the preference and supplies of the individual

household, though camping sets which pack in a small space can be purchased at moderate prices.

A camping trip on the programme lined out above can be managed at a cost of a dollar a day per person. The food will be considerably less than that. The cost of elements entering in depend of course upon circumstances. If tents are purchased, the full cost of these cannot be entered on the books for a two weeks' trip, as they will last season after season. Many households will already

have the full equipment required. The expense of motor fuel will depend on the distance covered. Some days this will amount to little or nothing. It is a common practice for the motor camper to drive to a forest reserve, select a camp site for a week, and spend most of the daytime exploring trails on foot.

No fixed budget will apply to every experience, but certain it is that the recreation and romance of the endless road are to-day obtainable by the citizen of moderate means.

LÈSE-MAJESTÉ

BY HERBERT S. GORMAN

THE idle chatter, rising like a fountain
In slender gushes, sinks in silver mist
Upon white shoulders. Higgins, from his mountain
Of watchful inattention, seems to list.

Colossus of wise butlers, for a minute
He sways in clouds of conversation, turns
His face against small flocks of words, and in it
I catch a lightning flash that twists and burns.

Now imperturbable he sees the lady
Depart in warm chinchilla, thinks of her
As something set apart and is afraid he
Might comprehend her motor's feline purr.

EXPERIENCES OF A PINCHOT WATCHER AT THE POLLS

BY IMOGEN B. OAKLEY

M^{R.} PINCHOT, who won out in the struggle between the progressive and reactionary factions of the Republican party in Pennsylvania, gives the women of the State the credit for his victory. He gallantly concedes more than they claim, but there is no doubt that the first check in the pleasant little game arranged by the bosses was administered by Mrs. Barclay H. Warburton, Vice-Chairman of the State Republican Committee, when she announced that the women of the State would not vote for any one of the three men favored by the organization.

Courageous, and even daring, as was her act, it had been made possible by the educational campaign conducted by the League of Women Voters.

The members of the League, facing the primary, had asked each other, "Why should we vote for men of whose opinions we know little and of whose characters we know nothing?" A natural question, but one the men of the State had never thought to formulate.

In order to see and know the candidates and their opinions, the League

arranged a series of public luncheons in Pittsburgh and Philadelphia. All the various party candidates for the Gubernatorial and Senatorial nominations were invited and given the opportunity to define their attitude toward the problems confronting Pennsylvania.

Over a thousand women gathered at each luncheon. They were a critical audience. They wanted facts. They were not stirred by declarations that the Constitution must be preserved, nor were they roused to enthusiasm by apostrophes to the flag. They were noticeably unresponsive to the oratorical efforts of the three favored candidates, but Mr. Pinchot's suggestions of the best way to "clean up the mess" in Harrisburg were warmly applauded. Mrs. Warburton knew on whom she could rely when she made her declaration of independence.

The women did more than vote for Mr. Pinchot. They watched at the polls and had an eye on the counting of the ballots. In almost every election division of Philadelphia one or two carefully instructed women sat at the polling-place, and several more, under the name of Vigilants, patrolled the pavement, ready to summon legal or police assist-

ance should the watchers be in need of either.

The Voters' Assistance Clause of the Pennsylvania Election Law complicates the task of the independent watcher. Under this clause, any voter claiming a disability may receive assistance in marking his ballot. The disability may be physical or mental. A voter may be blind or lack his right arm; he may be feeble-minded or merely not know how to read or write; in either case he claims a disability and asks for assistance, and a kindly ward leader is always at hand to go into the booth with him and mark his ballot.

In the election of 1915 thirty thousand voters asked and received assistance. Pennsylvania ranks low in the scale of literacy—the superintendent of the Philadelphia public schools has just told us that there are eighty thousand illiterates in that city. Yet even with this large number of citizens unable to read or write any language it seems improbable that thirty thousand men should have required assistance in 1915.

The Voters' Assistance Clause, on the face of it, is merely a device to enable ward leaders to keep tab on the voters who are paid for their votes, and it is a

¹ Concerning the selection and use of medicines we advise consultation with a trusted physician in advance of the trip.—The Editors

matter of current belief in Philadelphia that the number of assisted voters in any election depletes the treasury of the assisting party by as many dollars.

At a general election the voter who claims a disability and asks for assistance is made the judge of his own disability. He may not be challenged unless the challenger has positive proof that the disability is assumed. At the primary, however, the voter asking assistance may be challenged and required to make an affidavit that his disability is as claimed, and it is the duty of the watcher to look on the registration list for the name of the voter asking assistance and see whether he wrote his name or made his mark. The performance of this duty has often been attended with consequences uncomfortable for the watcher. In my own ward brawls and fights have not been uncommon, and before the Personal Registration Act went into effect the independent watchers had sometimes to be carried from the polls to the hospital. Happily, no such fate befell my alternate nor myself, and our faithful Vigilants had no more serious duty than to give us an occasional reminder of their supporting presence.

Our polling-place, instead of being in a saloon, as in the old days, was in a sufficiently respectable office. The election officers, who were all Negroes—for in my ward the Negroes have a numerical majority—were courteous and carried their courtesy to the unexpected and agreeable extreme of refraining from smoking. The judge sustained all my challenges, even one against the hitherto all-powerful division boss, who was the only white organization watcher and the only one who showed hostility toward us women. Early in the day he brought in an old colored man as feeble in mind as in body and said to the judge, "This man cannot read or write. Make out an affidavit for him."

I found the man's signature in the registration book, and challenged. The boss said, contemptuously, "No one can read that scrawl." "I can," I replied. But the boss repeated his order to the judge. I again protested, and the boss, losing his temper, shouted, "Give that man an affidavit, I tell you."

I went to the dazed victim of our election laws and said, "Don't you know that if you put a mark on that paper you will surely go to jail?" Seeing that I knew the law and that the Vigilants were ready at a signal from me to call legal assistance, the boss hastily left the room and sent in a colored sub-boss, who told the old man that it was not necessary to make an affidavit. "Take this and copy it," he ordered, and, thrusting into his hand a sample ballot, he pushed him into a booth.

Sample ballots marked for the organization candidates were handed out openly and freely to all who asked for them and to many who did not ask. I knew that under the law such open distribution of sample ballots is not permitted within fifty feet of the polling-

place, but I knew also that the courts had construed the law liberally and the judge would probably not sustain me if I should make a protest. I contented myself, therefore, with saying to a watcher whose pockets bulged with ballots, "Don't you think what you are doing is perilously like assistance?" He made no answer, but I noticed that he handed out no more ballots in the room.

This lavish distribution of sample ballots was reasonably good evidence that Mr. Pinchot's opponents had not resorted to the "floating ballot," a method of assistance which may or may not be indigenous to Pennsylvania, but which is so effective that, in the parlance of the street, it makes the Voters' Assistance Clause "look like thirty cents."

Under this method, a duly instructed voter, whom we will call No. 1, goes to the polling-place, takes an official ballot, and vanishes into a booth. After a suitable length of time he emerges, and what he does then depends upon the party affiliations of the judge. He may "forget" to deposit his ballot or he may drop into the box a sheet of white paper folded to resemble the ballot.

In either case, he walks away with an unmarked official ballot, which he delivers to the division boss, who awaits him in a convenient and secluded spot. The boss marks the ballot and gives it to No. 2, who goes to the polls, takes an official ballot, pretends to mark it, but on going out drops into the box the ballot marked by the boss and carries away the unmarked one. This is marked by the boss and given to No. 3, who does as did No. 2—drops the marked ballot in the box and walks away with the unmarked one. No. 3 is followed by No. 4 and No. 5, and so on to No. 100 or No. 200, according to the needs of the party or the number of purchasable voters in the division.

This method pleases both the boss and the assisted voter; the boss, because the series of unmarked ballots delivered to him is proof that the bought voter has stayed bought; the voter, because he is spared the humiliation of publicly proclaiming himself illiterate if his illiteracy be genuine, or the possibility of a jail sentence if it be assumed. The final count will show a ballot short, but there will be no clue to the identity of No. 1, who forfeited his own vote to begin the series.

The mysteries of the "floating ballot" were duly explained to inexperienced watchers, and my alternate and myself followed vigilantly the count for Governor. Ballots and stubs came out even, and the division boss said, "The matter with you women is that you are too suspicious."

When the polls opened, the judge assigned me a seat near the desk, where I was able to keep an eye on the registration book. My proximity to the book troubled the organization watchers, and during a temporary absence of the judge one of them said to me: "You are in the way there. Sit over here against the wall."

"But the judge gave me this seat," I remonstrated.

"What if he did?" said the man, squaring his shoulders. "I am the division boss, and what I say goes."

"Very probably," I answered, sweetly; "but I am required to take my orders from the judge, and, with your permission, I will sit here until he returns."

But when he returned nothing further was said about my moving.

Late in the day an organization watcher said suddenly, "No one has voted from Mulberry Street." "No," said another, "and I'll tell you why. A lady on Mulberry Street was put in jail last month; the division leader didn't get her out, and nobody's votin' on that street."

Four hundred and sixty-nine names were on the registration list, but only 309 ballots were cast. It is not so long ago that these figures would have been reversed, and it is barely possible that the revolt on Mulberry Street and the falling off in the number of voters is an indication of the waning power of the boss.

The election officers and organization watchers in my division were all old friends and co-workers at the polls. Two of them were father and son, two were husband and wife. They were intimate with most of the voters, asked after the children, and inquired why John or James or Amelia had not yet turned out to vote. It was quite a family party, and I felt like an unbidden guest.

Except for my challenges and an occasional difference with the division boss, the election in my division was peaceful and uneventful, and so it was in the majority of the election precincts. For this peace and order the Prohibition Law was largely responsible. The law is broken in Philadelphia, as in other cities, but the mass of the people support it, and no better evidence is needed than the order that prevailed at the polls. In a division often disgraced with drunken brawls I saw no sign of liquor and the most disreputable-looking voters exhaled no alcoholic odor, and from a majority of the divisions the women watchers made the same report. We were told the next morning that the quiet election was not due to the women watchers nor to the Prohibition Law, but to a special order from the chief of all the bosses that there were to be no disturbances at the polls. That may have been, but the fact remains that public sentiment would have tolerated no disturbances, and he knew it.

The bosses are learning, but there is still much that they fail even to apprehend. As the polls closed, the same sub-boss who had tried to get me away from the registration list said, "What are you going to get out of this?"

"A good Governor, I hope," I replied.

"Don't try to come that over me," he retorted. "Nobody works for nothing. What's in it for you? If you don't get paid for watching, you're out for a job."

It is this lack of imagination that may be the final undoing of the boss.

PULLING MAIN STREET OUT OF THE MUD

HOW UNCLE SAM, IN THE RÔLE OF A GIGANTIC ROAD-BUILDER, IS HELPING THE STATES BUILD A VAST INTER-CONNECTING NETWORK OF 185,000 MILES OF GOOD ROADS THAT WILL TIE TOGETHER ALL COUNTY SEATS IN AMERICA

BY NEWTON FUESSLE

STRANGE and peculiar things have happened to the alimentary canal. It is no longer the simple, human piece of digestive apparatus it used to be in the days when every home had its yard, and every yard had its garden, chickens, and cow. The table of to-day is usually so remote from the source of its supplies that the speed with which butter, eggs, and vegetables are rushed into the hands of the cook has everything to do with the usefulness of these products. For their day is short.

The digestive journey of a bottle of milk may be said to start long before it flows through human lips. So does the digestive journey of almost everything else on the menu. Good roads have therefore come to be almost as important a part of the digestive tract as good teeth and good stomachs. Hence the road that the delivery truck has to traverse assumes a vital biological importance.

The term "good roads" is one of the least understood and likewise one of the most misunderstood terms in the American vocabulary. Multitudes of benighted residents of large cities still think of good roads merely as smooth and sporty stretches where they can step on the throttle and see what the old car can really do. Farmers of course know better. But vague and foggy remains the general conception of the subject. One inclines to regard good roads from the angle of one's own personal and restricted actual contact with them. And few realize that good roads are as essential a part of manufacture as lathes and benches and manual labor itself; for without the prompt and proper distribution of a product manufacture is an empty and unthinkable gesture. And every pin or thread or button that is manufactured has to rely sooner or later upon good roads to complete its journey to the consumer.

America has achieved a high degree of accomplishment in the neglect of its roads. The Appian Way seems to have been generally regarded as a piece of historic bunk. The Roman Empire may have deemed good roads a necessity, but our idea was sky-scrapers, elevators, and Hudson Tubes. When a farmer got sick of slopping through the mud, he moved to the city. The term "stick-in-the-mud" became a symbol of the hinterland.

THE ROAD OF ROADS

The motor industry realized that the sale of its rolling stock was directly dependent upon the right kind of road

surface over which to roll, and eight years ago a group of automobile men and others got together and organized voluntary groups of citizens to promote the biggest road-building project in history—3,305 miles of continuous im-

MOTOR BORN INTO ROADLESS WORLD

"THE automobile was born into a roadless world," declares John J. Raskob, chairman of the Finance Committee of General Motors Corporation. "Compared with the millions of miles of telephone wires and the thousands of miles of steel rails which make the telephone and the steam locomotive effective, the automobile is still in a roadless world. When Morse invented his telegraph and Bell his telephone, man had long before learned to draw fine wire; else these two inventions would have been useless. The railroad train would be merely an interesting mechanical curiosity in the Smithsonian Institution if man had never found a way to make tracks for it to run upon."

"The automobile was the creation of brains which dreamt of thousands of miles of boulevards where once existed mud-holes and ruts. Once more by comparison we have only commenced to cover up those mud-holes and ruts. Yet a good roads movement which promises incalculable benefits to mankind is well under way. In this movement the automobile has been the most powerful missionary, emphasizing as nothing else has done the universal advantage to be derived from adequate highways. Every time a telephone rings there is a motor car somewhere in this country which has traveled seven miles performing some useful function."

proved motor road, running from New York to San Francisco, known as the Lincoln Highway. More than \$41,000,000 has been spent up to date in actual construction work on the Lincoln Highway. The gaps that still remain are rapidly being closed up, and the big trail will probably receive its finishing touches long before the end of the twenty years originally figured necessary.

The Lincoln Highway, far from being merely a sporting proposition for those taking a vacation at the steering wheel, has proved to be a vigorous text-book and object-lesson, not only in the build-

ing and upkeep of good roads, but in their social, economic, and physiological advantages. Physiological? Exactly—for, as Mr. J. Newton Gunn, President of the Lincoln Highway Association, points out, good roads involve the elimination of much of the fatigue that mankind otherwise has to contend with. And scientists point out that the reduction of fatigue serves to prolong life itself.

Hugh Chalmers claims that we always pay for what we need, whether we buy it or not. Thus the farmer who has to drag his product through mud up to the hubs of his wagons pays, in time, loss of energy, and fatigue, a price fully equivalent to the cost of good roads.

The work of the Lincoln Highway Association has been largely promotional; the actual building funds have come from the regular road funds of States, counties, and Nation, and the sections of the Lincoln Highway in each State that is traversed are being improved as sections of the respective State highway systems.

A ROUGH ROAD TO GOOD ROADS

It is hard to explain public stupidity. We are a church-going, lodge-joining nation. We cling to the idea of public schools. We go for miles to hear the claims of candidates for public office. And yet we have traveled with only the speed of a snail to the idea of better roads over which to go to church, school, lodges, mass-meetings, and to market.

The first puritanical notion that motor cars were pleasure cars may have had something to do with the reluctance to improve our roads, since motor traffic promptly sought the better roads. The next notion was, and largely still persists, that the motorist should pay for the construction and upkeep of good roads. The fact is that one-sixth of last year's \$767,000,000 bill for building and upkeep of American roads was paid into the road funds by motor license fees. Motor vehicle receipts from all sources connected with the motor vehicle and paid into city, State, and Federal treasuries for 1921 are estimated as follows: Federal taxes, \$115,500,000; State registrations, \$122,500,000; personal-property taxes, \$52,500,000; wheel taxes, \$3,300,000; gasoline, \$11,000,000; a total of \$304,800,000. After deducting that part of the road bill paid by the automobile, the remaining cost for good roads was the trivial sum of 1.2 cents a day per person.

If you are a local politician, the subject of roads may still connote politics

HERE IS THE VAST PROGRAMME OF INTER-STATE AND INTER-COUNTY CONNECTING ROADS
THAT UNCLE SAM IS AIDING THE STATES TO COMPLETE

to you. It used to be that when a county had a Republican administration it had a Republican road commissioner, and when the Democrats came in the county had a Democratic road commissioner. And yet, according to Mr. Lawrence F. Abbott, speaking at a recent good roads dinner, "it does not make the slightest difference to the average citizen whether he rides on a Democratic road or a Republican road. . . . Partisan politics," he stated, "is worse for the substratum of a good road than adobe or clay soil. We used to build our roads on partisan politics."

The long-continued reluctance of local authorities to disconnect road building from partisan politics and to rely upon non-partisan State highway commissions accounts in large measure for the terrible condition to-day of most of the 2,600,000 miles of roads in the United States. Only one-third of these roads have been improved up to a good standard.

Local political job-holders have hung on tenaciously. They have hated to surrender. The contest has been long and dramatic and is a vital issue to-day. Even where competent, non-partisan, scientific State highway departments have been accepted as necessary to the States' governmental establishment, political favoritism or interference is ever in evidence. As recently as in 1916 a score of important States did not have State highway departments. The Eastern and Far Western States have more freely given both authority and funds to their highway departments than have

the great Central and Southern States which need roads so badly.

Conditions became so bad that the Federal Government itself had to take a hand. Through the United States Bureau of Public Roads it deals only with State highway departments, and is exerting a powerful influence against political interference with such departments. It contends that the building and maintenance of roads should be kept in the hands of skilled road builders of scientific training and broad

practical experience, and that the right men should be kept in power through successive State administrations, instead of being shifted by every changing political wind. This Federal bureau has wisely been kept out of politics, for its work involves problems as vast as that of building and operating railways.

President Harding is giving a great deal of personal attention to good roads, and talked to me very emphatically on the subject.

SOME OF COXEY'S DREAM COMES TRUE

Did you know that road building was the only American industry that went rapidly forward during the industrial slump of the past few years? In 1919 the Federal Government appropriated more money than ever before for road building. This provided work for many ex-service men and others who had been jolted off of pay-rolls by the depression.

This represents a vast change of Federal attitude since the days when "General" Coxey, at the head of his grotesque army of unemployed, marched to Washington, and was arrested and jailed for not keeping off the grass around the White House. Coxey's spectacular march (the late Jack London was in it and was its chief press agent) was motivated by the demand that the Federal Government should become a road builder and give jobs to a lot of unemployed.

Previous to 1919 Federal appropriations for road building were so small that the States to which Federal aid was offered hardly knew whether to take it or leave it. To-day Federal aid

OF PUBLIC ROADS

OUT OF BANGOR, PA., CURVES THE TEMPTING SURFACE OF A TYPICAL CONCRETE FEDERAL AID ROAD

to States for road building amounts to \$75,000,000 for this fiscal year, and has given employment to vast numbers of men. At least seventy-five per cent of the whole sum expended by Uncle Sam goes to labor, including the work done in stone quarries, brick kilns, asphalt plants, in transportation of materials, and on the roads themselves.

GENIUS OF GOOD ROADS FLOWERS IN IOWA MUD

Nearly every spring and fall every road to the little Iowa town of Montezuma used to become impassable. A complete tie-up took place at the horrible hands of mud. Horses sank up to their knees and wagons to their hubs in the thick, soupy troughs that were supposed to be roads. There was a grain-and-lumber dealer in Montezuma, and his business always came to a standstill during this grievous semi-annual mud-blockade. This dealer had a son named Tom, a stocky little chap who was frequently about the lumber yards and the grain elevators. The movement of lumber, of flour, of building materials, to the farms in a rich farm community, and the opposite movement of the grains from the farms to the elevators—the business life of a typical agricultural community—were matters of daily contact. So, too, intimate knowledge of the business of the small-town merchants only accented the mutual loss to town man and country man of the seasonal traffic cessation. At that time the possibility that such conditions did not need to exist had not yet occurred to Tom or to the community. Waiting for the roads "to get better" expressed the same resignation of spirit as bearing any other of the afflictions attributable to the acts of God.

This youngster's restless temperament resented the spring and fall mud blockade that stopped deliveries. It was a dreary spectacle to him. It depressed him in a way that he never forgot.

When he grew up he went to college. He registered for an engineering course at Iowa State College, at Ames. Here he came under the instruction of a civil engineer in whose far-reaching vision such community afflictions as road blockades had no rights of existence. Dean Anson Marston, who was then and still is at the head of engineering, was one of the very few college professors who foresaw the great future of scientific road building in this country. That he spared no personal effort or lost no opportunity to impress this upon his students is responsible more than any other reason for the fact that this college student in his senior year, when he came to write his thesis, chose the far from academic subject of roads. He took measurements of the tractive resistance of different kinds of road surfaces. He made a study of the actual experience of townships and counties in road improving. He made an investigation as to what became of road-building tax levies. He made a count of the amount of actual use that farmers in typical townships made of highways.

The year of his graduation from college the Iowa Legislature did an unusual thing. It constituted the Iowa State College, as an institution, the State Highway Commission. No State had ever done anything like this before, and no State has ever done anything like it since. Very naturally the general direction of the work was placed under Dean Marston, of the Engineering Division, and Dean Curtiss, of the Agricultural Division.

Careful investigation of the cost of macadam roads then being built in the East showed the alarming figure of \$5,000 per mile, and the College, aghast at the high figure, did not have the heart to tell the State of Iowa.

It was at this point that the directors of the Iowa Commission decided to retain the student, now graduated, who had already started studies of the road requirements within the State, to continue and to extend these studies.

The young engineer of the unique Commission wanted to know what was being done with the meager amount of Iowa funds available for roads, and discovered that bridges and culverts over the State's innumerable big and little creeks were eating up nearly all of the money. The bridges and culverts were temporary wooden affairs, requiring almost constant attention and replacement. And so he inaugurated a policy of building substantial and lasting structures of steel or concrete. He not only inaugurated the policy, but put on overalls and helped carry it out by teaching local officials how to build concrete culverts.

AN INDUSTRIAL TITAN

Such was the beginning of the career of Thomas H. MacDonald. From that time on he loomed into a more and more important good roads figure. From 1904 to 1919 he was State Highway Engineer of Iowa, and he is to-day Chief of the United States Bureau of Public Roads.

TOURING CARS AND FARM TRUCKS DELIGHT IN THIS FEDERAL AID ASPHALTIC CONCRETE HIGHWAY THROUGH MILFORD COUNTY, P.

As head of the Federal aid road-building organization he is one of the biggest industrial figures in the world.

Working in co-operation with the State Highway Departments, MacDonald is supervising road work in every State in the Union, and on the first of April this involved the construction of \$233,015,000 worth of road projects, representing 13,563 miles of all kinds of roads, toward which the Federal Government contributed \$98,640,000. Moreover, in addition to the work actually under construction, there had on the date been completed \$275,966,000 worth of roads, representing work in all the States, a total of 15,688 miles, to which Federal Aid had contributed \$118,253,000.

This man MacDonald has the physical and mental capacity for getting under load of responsibility that would crush most executives. He is built like a line plunging full-back—short, thickset, close to the ground that he wrings into roads. He is calm, quiet, unflustered, and apparently untiring. His department in Washington is under Civil Service, but his clerks do not knock off work at 4:30 P.M. His office is usually still humming with activity at six.

A few years back Iowa State College didn't have the heart to tell Iowa taxpayers that it would cost \$5,000 to build a mile of good road. Yet to-day the Federal aid programme averages nearly \$18,000 per mile of good road, and no one in Congress or out of Congress is kicking. So competently is the Federal Bureau run that only two and one-half per cent of Federal aid appropriations go for administration. All the rest goes into actual roads.

Federal aid works with a State highway commission on a fifty-fifty basis. Mr. MacDonald tells me. But the States have oversubscribed their share. Federal aid is apportioned among the various States on the threefold basis of their population, area, and miles of

post road. Each of these factors is taken in ratio to totals for the whole United States. But, regardless of these computations, no State gets less than one-half of one per cent of all Federal aid money available. It happens that New York gets five per cent, while Texas tops the list with six per cent.

The Cumberland Pike, started by the Federal Government in 1806, was the first comprehensive Federal road-building project. Its object was to provide a first-class highway to carry traffic through the mountains westward. But with the big railway-building impulse of 1840, the Government directed its aid to railways, and wagon roads became purely local projects. Even State aid was withheld from road building until New Jersey in 1891 appropriated State funds to aid counties, and in 1892 Massachusetts came forward with a State Highway Commission, and was fortunate enough to get Dean Shaler, of Harvard, on this Commission. This gifted geologist put road building on a scientific and soundly technical basis.

A BEWILDERING TASK IN CONTINUITY

Even the ambitious servants of Uncle Sam who hewed the Cumberland Pike through the mountains would have been dumfounded had they been able to look more than a century into the future and catch a glimpse of what to-day the Bureau of Public Roads in co-operation with the State Highway Departments is accomplishing in road building. The job is a gigantic one. It is driving across the face of the earth a vast, co-ordinated, interconnecting network of roads that will join at State boundaries, and ultimately provide continuous main arteries of good roads that will connect all of the county seats in the United States without a single break.

It is a staggering job in continuity. Mr. MacDonald estimates that it will cost to complete it nearly three billion dollars, of which the Federal Government will pay something less than half.

A bewildering mass of State road naps keeps rolling into Mr. MacDonald's office. These have to be co-ordinated, so that the main roads of one State may connect at the State boundaries at all points where an adjoining State's roads begin. Nothing is left to chance.

Seventy per cent of Federal aid mileage consists of graded and drained sand-clay, gravel, and macadam roads. This means pioneer work—building roads where there are no roads. The hardest operating conditions are found in the Mississippi Valley—Mr. MacDonald's old stamping-grounds. This is the worst region in the country for effective road building, and is likewise the region that needs good roads the most. The climatic conditions in combination with the clay, gumbo, and black waxy soils hamper road building, and this is the soil that holds water so long that ordinary roads become impassable during the rainy seasons.

The country has been divided by the

Bureau of Public Roads into eleven districts, each with its staff of engineers. These work closely with State highway departments, which are the real construction units. When a State project is submitted, the Federal Bureau has its engineers go over it. The Bureau makes sure that State funds are available, and every phase of the project is carefully investigated. If approved, the State Commission proceeds in co-operation with the Bureau. No Federal funds are disbursed save in payment of vouchers for work actually completed and approved.

Under this plan, the United States is building the best roads in the world to-day, and the work proceeds in a rapid, orderly, efficient manner, with highly perfected equipment and with notable labor-saving devices.

"It will require at least 185,000 miles of primary roads," Mr. MacDonald told me, "to give the country the required network of continuous and interconnecting highways contemplated by the present Federal aid programme. But that mileage represents only seven per cent of the total roads of the country. We gave the railways huge Government grants in their early days, but there are people who complain that the trucks do not pay the whole cost of building roads over which to carry short-haul loads of commodities. The Government wants the public to regard road building as a business proposition that must be carried on by experts, free to work at construction and maintenance with the knowledge that they will be supported as long as they do good work. The work of the State highway departments is of basic social and economic importance. It is a long-time job, and there should be sufficient tenure of office to enable these men to finish a long-time job without

interruption, completing the roads of a State in the order of importance to itself and its neighboring States. The cost of road building should not be paid by taxes levied entirely against the land adjoining the roads, but by taxes levied against society."

MOTOR TRUCKS AND RAILWAYS ARE ALLIES

Uncle Sam's road chief points out that there is no competition between highways and the railways. The railways as freight movers are essentially long-haul carriers of such commodities as grain, live stock, and coal, while motor trucks cannot hope to figure in the long-haul movement of these products, but are primarily useful in the local gathering and distribution of dairy products, vegetables, fruits, and manufactured merchandise, and the relief of rail congestion at the terminals. New York department stores have made elaborate tests in which they have found that it is cheaper and more satisfactory to ship by trucks than by railways where the distance is under forty miles.

In reply to critics who claim that truck traffic does undue damage to good roads, Mr. MacDonald replies that if trucks are properly built, loaded, and operated they do not menace the roads. As to construction, he points out that some truck manufacturers are at fault in concentrating too much of the weight over the rear wheels, so that many trucks carry sixty-five to seventy per cent, and some as high as ninety per cent, of their weight over the rear wheels. This is a mistake. Trucks overloaded by their operators are also bad for roads; a recent investigation in Connecticut shows seventy-five per cent of all trucks overloaded. Worn tires inflict undue road shocks, while pneumatic tires are tremendous road savers.

But lack of correct upkeep of roads, according to Mr. MacDonald, constitutes the worst menace. The moment a vehicle encounters a bad road surface the destructive effect of the vehicle increases four to seven times.

The cities have no idea of the impatience with which rural sections, now that they have become aroused, are clamoring for good roads. The task of Chief MacDonald and the States co-operating in Federal aid construction is the difficult one of confining their labors to the primary, interconnecting arteries of travel that join county seat with county seat and State with State. Huge contracts for this work are being closed all the time, but the means of travel have so far greatly outstripped the improved roads of travel. There are eight billion dollars of capital now invested in automobile rolling stock in this country, while from 1910 to 1921, inclusive, the cumulative investment in good roads has mounted only to \$2,526,000,000. This leads Mr. MacDonald to insist that the United States ought to be spending much larger amounts than the money now available each year in order to get the job done within a ten-year period.

A MERCHANT PAID \$25 PER 100 POUNDS FOR A FOUR-MILE HAUL AND POSTAL AUTHORITIES PAID \$12.50 PER DAY FOR ONE DAY'S MAIL DELIVERY A FEW DAYS BEFORE THE PHOTOGRAPH WAS TAKEN

FORTY ACRES IN ONE

PICTURE FROM AN OUTLOOK READER

Copyrighted by Professor Woodbridge Metcalf

The forests of the redwood region of California, although long a center of interest, have only recently been made accessible to the motoring tourist through a State highway.

This is a scene on Bull Creek Flat, in Humboldt County, California, not far from the new California State Park, now being made ready for the reception of tourists. In the picture are trees of over eleven feet in diameter at a point five feet from the ground and three hundred to three hundred and fifty feet tall—taller than the Big Trees of the Sierras already known to the vacationist. The floor of the forest is here a uniform carpet of oxalis. In other groves the forest floor is covered with a luxuriant growth of ferns over six feet tall. The redwood is found only in a narrow broken strip on the California coast from Monterey north to just over the Oregon line, and not more than forty miles inland. A stand similar to the one pictured and a few miles from it was recently cut and a sample acre scaled. It was found to contain over one million board feet. An acre of this timber would therefore yield more than forty fairly good acres of Eastern timber.

THE BOOK TABLE

WHAT BOOKS DO BOYS RECOMMEND TO EACH OTHER

BY HUBERT V. CORYELL

IN the past ten years, especially the last five, I have been learning that if you can get boys to discuss the books that they have read, passing judgment from one to another on the relative merits of these books, the sum total of their opinions will be not far from correct. Boys can distinguish the masterpiece from the time-killer just as well as we grown-ups—sometimes better, for they are not prejudiced, as we are, by tradition. Moreover, the honest recommendation of one boy to another carries far more weight than the recommendation of any grown-up; for boys, through sad experience, have come to suspect us adults of wishing to force "dry old stuff" down their throats. Instead, therefore, of arbitrarily choosing their books for them, it behooves us to get boys to discussing book values among themselves, and to find out what they recommend to one another, so that when we are called upon to give a book to a boy we can say, "Here, Bill, this is a book that Tom, Dick, and Jim are crazy about," at the same time knowing that discriminating grown-ups approve of the book too.

Perhaps it seems like assuming a great deal to be confident that combined boy opinion will to any extent coincide with mature adult opinion. But in this case it is not an assumption; it is a cheering fact brought to light by a good many years of careful investigation on my part. Let me describe the way in which I have come to this conclusion.

When I was a boy myself, I remember thinking that my teachers were the poorest judges of literature I had ever met. They gave me nothing to read but "dry old stuff" like "Evangeline," "Enoch Arden," "Silas Marner," "Roger de Coverley Papers," and the like. I resolved at that time that if I ever got to be a teacher I should recommend something worth reading, like the "Jungle Books," "Swiss Family Robinson," "The Last of the Mohicans," and others of the same sort.

When I did become a teacher, I began confidently prescribing these books. Soon, to my surprise and regret, I found that the boys felt very lukewarm toward them. Indeed, I had real trouble with one boy, who disliked "The Last of the Mohicans." I did my best to make these books interesting, but the boys had no enthusiasm for the books I prescribed.

However, one day a boy brought into class a book that I had never heard of, called "With the Indians in the Rockies," by James Willard Schultz, and begged me to let the class read it. He exhibited the book to all, told me it was

a true story, and showed me that Houghton Mifflin Company had published it, which rather eased my pedagogical fears. The class read the book with infinite delight. It was full of interesting and true-to-life descriptions of the way a white boy and a Blackfoot Indian managed to live through a winter in the Rocky Mountains, cut off from every supply or source of help. They did not even have weapons or fire when their adventure started. Yet they lived and—but I must not spoil the story. It is worth reading.

That happened several years ago. At first I thought simply that I had discovered a marvelously fascinating book. I had; but that was not the best thing I had discovered; the real discovery was that boys are eager to read what other boys recommend, and that they harden themselves by force of habit against anything prescribed by a teacher. So I decided to stop prescribing, and to let my boys lure each other on. I planned, of course, to veto books that seemed undesirable; but I wanted to see what boys would actually recommend to each other and to stir them up in this way to reading more widely.

My literature periods began to change their aspect. Before choosing a book for reading in class we called for suggestions; boys offered their favorite books, gave their reasons, and voted on what seemed most worth reading. In the older classes—boys from twelve to fifteen—we ceased to read much in class, but discussed books in class and read them outside. Then we began to have boys prepare careful reports on their reading, to be made orally, reading a sample incident from the book reported on and passing a personal judgment on the value of the book.

Almost at once we found ourselves dividing books roughly into three classes: Class I, the books we felt no boy should miss; Class II, worth-while books that could not be classed so highly; and Class III, books which were frankly time-killers. We discussed the qualities that would put a book in one class or another, and settled the matter by vote; for I had learned by this time that teacher arbitration was like sand in a gear-box.

Presently we began to make some calculations as to how many books a boy could be expected to read during his boyhood. We decided that the number was probably between two hundred and four hundred. We estimated that there must be several thousand books for boys on the market. We then saw plainly that we must choose a very small percentage

of these to read. We discussed the basis of choice. We decided that the common-sense thing was to read the superfine books first—the books that "no boy should miss." We decided that after this we should read the merely worthwhile books; and that we should read the time-killers only when we got restless and felt that we must have a literary spree. This all came out in class discussion, perhaps helped by a little judicious guidance on my part; but, as finally put, it was a class vote, and even as such was no more than a recommendation. Each boy was left free to make his own actual decisions.

Somebody then suggested the gathering of a list of books that "no boy should miss." We voted that each boy should make an alphabetical list on cards of the books that he believed should be included in Class I. We started. Soon a boy said he wished we could have a Class II list also. Lastly, one lover of thrilling adventure stories said that he didn't see why we couldn't keep a list of the time-killers too. So it was voted that each boy should classify all the books he had read into three classes, and that we should combine these lists. Again we started. Day by day boys brought to class library cards on which they had written the titles of the books, the names of the authors, and the names of the publishers. Also they wrote on each card a brief statement as to what the book was about, and why they classed it as I, II, or III.

I believe that this process of classifying books according to their merits, each boy passing his own judgment independently and giving his own reasons, did more to develop a thoughtful attitude toward books than all the teaching and preaching I had ever done. We did nothing to forbid the trashy book; but the very act of labeling it trashy raised the boy's own taste one step higher. He became less inclined to read that kind of book when he had a good list of other books which his comrades declared were "too good to miss."

A curious back-fire from this scheme of getting the boys to form their own opinions came at about this time in the form of requests for my opinion on doubtful books. I was tempted to use these requests as opportunities for teaching real literary appreciation. But I controlled the impulse. Instead, almost invariably I threw back the question on the class or on some boy in the class, not giving my own opinion unless pressed for it, and even then giving it without undue emphasis. For instance: a boy asked one day what I thought of "Lorna Doone." Instead of pouring out my own liking for the book, I said, "Well, I like it, but I'm not sure how it would appeal to a boy. It may be too old for you." At that a boy who had previously put himself on record as lik-

ing "blood-and-thunder" books raised his hand. "Oh, I don't think it's too old," he said. "I liked it."

"Did you find too much long description?" I asked.

"Oh, there was some description," he answered, "but most of it was interesting."

By this time three other boys were nodding agreement. A fourth held up his hand and said he thought it was slow. One of the advocates asked him how far he had gone in it, and he blushing admitted that he had read only a few pages.

"Oh, well," said the first boy, "you can't tell what a book is going to be like in just a few pages." And the class chuckled its approval, though probably most of them had a tendency to drop a book after a few pages of trial if it was slow.

Now had I, the teacher, praised the book and chided the boy for not giving it a fair chance, no other boy would have read "Lorna Doone," and almost all would have made up their minds to go on dropping books with slow beginnings. But because my "blood-and-thunder" friend in the class had done the talking several read the book, and I suspect several resolved to give other books a fair trial.

Another boy asked me what I thought of Zane Grey's books, saying that his father liked them but his older sister said her teacher called them trash. As a matter of fact, I enjoy Zane Grey's stories immensely, but I should perhaps hesitate to recommend them to boys as really worth reading. As I was pausing to consider my reply a boy just in front of me spoke up:

"They're awfully exciting, but you couldn't call them Class I books."

"How would you class them?" I asked. He scratched his head doubtfully.

"I guess they're time-killers," he said.

Another boy, who is a curious combination of natural-born athlete, mischief-maker, and serious-minded student, but whose athletic ability and propensities for mischief bulk largest in the minds of his companions, asked me what I thought of "Uncle Tom's Cabin." As a matter of fact, that truly great book had never appealed to me as a boy, and I hesitated to answer frankly. I followed a hunch, and threw the boy's own question back at him.

"What do you think of it?"

"Oh, gee," he said, "I think it's great! I think it's one of the best books I ever read."

Later on he confided to me in the presence of several boys that after reading "Uncle Tom's Cabin" he had decided never to call a colored man a "nigger" again.

Many boys expressed the feeling that "Swiss Family Robinson" was absolutely impossible and childish, because everything came to the family on the island just when they wanted it. There was a big discussion on this point, but in the end a quarter of the class listed it as a book that "no boy should miss."

I could go on giving examples of this sort for pages and pages, but this is enough to indicate that if boys can be brought to frank discussion of book values they will show, on the whole, very good judgment; and that, since their mass judgment is almost always reliable, they influence one another for good to an extent that a grown person is powerless to do.

In combining the individual book lists by unanimous consent we took first the books "that no boy should miss." Immediately we found that to save waste effort we must list only the books that were recommended by at least two boys. After several days we finished the Class I list of books. When we started combining the second list, we found so many books that only one boy recommended that we had to discontinue combining lists, on the ground that we were wasting time. We could better apply ourselves in reading the books on the first list that we had not already read. So the list was mimeographed and passed around. This has been done now each year for three years. Seventy boys have passed judgment. The only thing I have done is to veto books that seemed undesirable—and in three years I have not vetoed half a dozen books!

The full list I keep on library cards. About fifty of the most popular books are put into the mimeographed list, with a brief statement of the nature of the subject-matter and with a number showing how many boys out of the seventy have recommended the book. The boys use this list willingly, because they know that other boys have made it up by their recommendations. They know that no teacher is imposing "dry old stuff" upon them. Yet here is the list, most of the books of which were recommended by at least ten boys. I do not think a teacher need be ashamed to offer such books to the young people in his care:

Adventures of Tom Sawyer.
Arabian Nights.
Biography of a Grizzly.
The Black Arrow (recommended by 44 boys out of 70).
Black Beauty.
Bob, Son of Battle (42 boys).
The Boys' Life of Theodore Roosevelt.
The Call of the Wild (48 boys).
Captains Courageous (39 boys).
A Christmas Carol.
The Deerslayer.
From the Earth to the Moon.
Gulliver's Travels.
Hans Brinker.
Huckleberry Finn.
In the Great Apache Forest.
Ivanhoe.
Jim Davis.
The Jungle Books (44 boys).
Kidnapped.
Kim.
King Arthur and His Knights.
Lad, a Dog.
The Last of the Mohicans.
Little Women.
Lorna Doone.
The Man Without a Country.
Men of Iron.
The Merchant of Venice.
The Merry Adventures of Robin Hood.

Monarch, the Big Bear.
Mysterious Island.
Oliver Twist.
On the Warpath.
Otto of the Silver Hand (36 boys).
The Prince and the Pauper.
Red Fox.
Robinson Crusoe.
Rolf in the Woods.
The Story of a Bad Boy.
Swiss Family Robinson.
Tanglewood Tales.
The Three Musketeers.
Tom Brown's School Days.
Tour of the World in Eighty Days.
The Trail of the Sandhill Stag.
Treasure Island (53 boys).
Twenty Thousand Leagues Under the Sea.
Two Years Before the Mast.
Uncle Tom's Cabin.
Westward Ho!
White Fang.
Wild Animals I Have Known.
With the Indians in the Rockies.

I hope that it will be noted that "The Jungle Books," "Swiss Family Robinson," and "The Last of the Mohicans," which I so nearly ruined for my boys by prescribing, are among their favorites, after all. By ceasing to prescribe them I saved them.

No doubt there are many good books missing from this list, many of higher literary value. But these are books for boys, and the main thing is to develop the appetite for wholesome reading by giving them something at the same time palatable and worth while. We consider this only a beginning. But, from the point of view both of the boy and of the grown-up, we consider it "safe and sane."

Measuring Roofs by the "year-stick"

AFTER all's said and done, there's only one way to measure roof value—that's by the "year-stick."

For when choosing a roof, the really important question is: "Which roof will last longest with the least trouble and expense for upkeep?"

In the light of long experience, the logical answer is: The Barrett Specification Roof. For in every section of the country there are roofs of this type that have been in service for thirty, forty or more years, and are still in good condition.

Despite *proved* durability and freedom from maintenance expense, Barrett Specification Roofs are moderate in first cost. And they provide a degree of fire protection not exceeded by any other kind of built-up roof.

It is only natural, therefore, that Barrett Specification Roofs are the choice of the leading architects and construction engineers the country over, and that today they cover a majority of all the permanent flat-roofed buildings in America.

The Only Bonded Roof

Barrett Specification Roofs are not merely guaranteed—they are *bonded*.

When the roof is 50 squares or larger and located in a town of 25,000 or more, or in a smaller place where our inspection service is available, the owner receives, without cost, a bond issued by The U. S. Fidelity & Guaranty Company, of Baltimore, protecting him against all repair expense during the life of this bond—Type "AA" Roofs, for 20 years; Type "A," for 10 years.

Before specifying or closing contract for a Barrett Specification Roof, be sure to read carefully all the stipulations in the specifications.

Full details regarding these Bonded Roofs and copies of the Barrett Specifications sent free on request.

"Say it with Flowers"

Your Florist Knows

To be able at all times and upon all occasions to say and do the "right thing" is considered an accomplishment. A careful regard for convention means simply a regard for each other.

And so those who pay tribute to the convention that makes it proper to send a gift of flowers to one's hostess have the courteous distinction that marks the ever welcome guest.

Flowers keep alive among us the spirit of gallantry. And you can make rich in happiness those you remember when you "say it with flowers" for birthdays, wedding anniversaries and other occasions.

Your Florist will be glad to aid in the selection of floral tokens appropriate for every occasion.

Flowers may be telegraphed to all parts of the United States and Canada and delivered in a few hours through the Florist Telegraph Delivery Service.

"Say it with Flowers"

FROM THE MAIL BAG

WEALTH, WORK, AND GOVERNMENT

IN whatever language the strike policy of the Government may be masked, its essence is, driving the strikers back to work by force. The policy is illogical, unlawful, futile, and extremely dangerous. All labor except a few willing strike-breakers will feel itself outraged and outlawed. Labor was promised a new status if it would work and fight loyally in the war. It did so. Is this the new status?

Unless the strikers return to work they are to forfeit their positions without remuneration. Can any one imagine the Government compelling the mine or rail owners to forfeit their mines or roads without rich remuneration under any circumstances whatever? The injustice of the Government to the strikers is self-evident.

The Government tolerates the claim that the strikers are now striking against the United States, a view energetically exploited by the employers. Had the law endowed the Railway Labor Board with the autocratic power involved in that view penalties would have been attached to disregard of its decisions. None were. It is grotesque to assert that the strike is rebellion against the Government or the people.

President Harding said to the Governors: "Your State Government and the Federal Government are jointly responsible for maintaining conditions under which free men, willing to work, may work in safety."

Governor Cox, of Massachusetts, said to the sheriffs, mayors, and others: "In the highest interests of the whole citizenship of Massachusetts, I ask your co-operation in making secure to each individual his inalienable right to work."

The "right to work" is a sham unless all men can get work at all times. Men are "free" only when this condition permanently prevails. The unemployment of large numbers is a nearly constant phenomenon in this country. Neither Government nor citizen will give them work. No right to demand it is recognized. Therefore they have no right to work. Therefore they are not free.

The spurious right to work becomes sacred only in one circumstance. That is when the unemployed are needed as strike-breakers. Then the United States Army is ordered out to vindicate the solemn sanctity of their right to work, and to assert the stupendous holiness of their "freedom."

The irony of this farce is more than tragical. It threatens the existence of our Nation. The only reason the army is called out to protect the right to work is that there is no right to work. Were there that right, there would be no unemployed to seize the strikers' places, and therefore no need of "protecting" them. Strikers and magnates would be on a par in the controversy. And if the Government intervened it would do so to

Around the World

by specially chartered Cunard Line new steamship

"SAMARIA"

A Cruise De Luxe

Strictly limited to 400 guests

January 24 to May 31, 1923

Sailing eastward from New York

A kaleidoscopic panorama of the world we live in—the wonders of the living age—the marvels of bygone civilizations—many different peoples and races—strange customs—you will find them all in this *Golden Jubilee Cruise*, which marks the 50th year since Thomas Cook, the founder of our organization, conducted his first tour around the world. On a magnificent new Cunarder you will circumnavigate the globe in 127 days—days that will ever be gratefully remembered.

There is a wonderful itinerary—with visits at Mediterranean Ports—Egypt, etc.—four weeks in British India, Dutch East Indies and Straits Settlements—Saigon, Manila, China—two weeks in Japan, etc.—visiting each country under the most favorable climatic conditions.

execute justice instead of to confirm and perpetuate injustice.

Boston.

MORRISON I. SWIFT.

[This letter states very tersely views on wealth, work, and government, which, in spite of their fallacies, are very common among partisans of labor in industrial warfare. Certain quite contradictory views, prevailing among partisans of capital, are characterized by corresponding fallacies. We can think of no better training in clear thinking than the undertaking to hunt out these fallacies from their lairs on both sides.—THE EDITORS.]

CAPITALABORISM

AN edition of Webster's Dictionary for 1890 has no word capitalism. Since then this word has been spoiled. The Socialists and Communists have taken the goodness out of capitalism and we need a word to take its place which in itself will convey a respectable meaning. I propose as a substitute the word capitalaborism.

At Johns Hopkins University thirty-five years ago, in bold letters on the wall of a most popular lecture-room, were these words: "History is past politics; politics is present history." So we might put up an inscription: Capital is past labor; labor is future capital.

A boatman named one oar "faith" and the other "works." He noticed that when he pulled "faith" alone the boat went round and round, and this was the case when he pulled "works." But when he pulled both oars his boat went forward even against the stream. So is it with capital and labor. Separated, we stand still or drift. When capital and labor are pulled together, the craft of the individual or of the state moves forward toward success.

The capitalaborist believes in the union of capital and labor against Communism. He is opposed to their separation and isolation. Money compensates labor and labor earns money. The antagonism is imagined, not real, with fair-minded, industrious people. They are envious and lazy people who see only evil in the possession of money. Whatever evil exists is not in the possession of the money, but in its distribution.

The remedy for bad distribution is not in Communistic equalization, nor is it in governmental ownership. The proper remedy must give full credit for superior preparation, superior ability, superior skill. We concede that honest industry must have a living wage, but we do not concede the same wage to all, regardless of efficient service. To reward superiority proportionately is the time-honored and time-tested principle under which skillful management unites labor and capital in the finest co-operation for the common benefit of human society.

On one occasion I divided a circle on the blackboard into three equal sectors. I labeled one sector "brains" and another "brawn," and asked the class to give me a word beginning with the letter b for the third sector. One lad suggested

Kidney Disorders

What an eminent medical authority prescribes for Bright's Disease, High Blood Pressure, Heart and Arterial Deterioration, etc.

Your kidneys are filters whose function is to remove waste products from the blood. When you have kidney trouble, these filters have lost the power to pick impurities out of the blood and throw them off.

How shall you rid your kidneys of these harmful substances? A medical authority of high repute says: "You can clean out your kidneys—and keep them cleaned out—by the liberal use of Paradise Water. This mineral-free water, from Paradise Spring in Maine, has the power to help wash the blood and tissues free from poisonous

waste products whose retention would continually damage the kidneys and other tissues.

"Sometimes, through misuse," adds this authority, "the kidneys get beyond repair. Give Paradise Water a chance before it is too late."

Paradise Water comes in convenient cases of 12 quarts, 24 pints, 36 half-pints. Natural or Carbonated, both delightful tasting, in addition to their health-giving qualities.

"banks," and the word was inserted. Brains, brawn, and banks make a formidable and winning combination. When management, labor, and capital work together success is at hand.

The New York "World," the "Globe," and the "Mail" have all used the word capitalaborism. Soon we shall hear the word used by famous statesmen. We hope to see it indorsed by leading magazines. It is a word which conveys its own wise, good meaning. Let it win its way as a substitute for capitalism.

CHARLES S. HARTWELL.

Pomona, New York.

THE VALUE OF THE GERMAN CHEMICAL PATENTS

YOUR editorial on the German patents and the Chemical Foundation, in the issue of July 26, is unquestionably the fairest and sanest discussion of this befuddled subject that I have seen. There is one point, however, that deserves special mention, and that is the

so-called "value" of these German patents.

Contrary to the general belief, a license to use one of these German dye patents does not enable a chemical manufacturer to produce the dye. It merely gives him the privilege of spending thousands of dollars and months or years of work experimenting, trying to determine how the dye can be made. Finding and applying the kernel of truth in these patents is a long, difficult job, even for trained research chemists. These patents are written with diabolical skill and the real essential points are concealed under an extremely clever barrage of words. Unfortunately, most of our legislators apparently believe that every patent granted is as clear and guileless as one covering a paper clip or a shoe-button. Until our chemical manufacturers have risked a large outlay of money for research work these German dye patents are of no value whatever, and the idea of placing an arbitrary value of so many millions of dollars on them is absurd.

BY THE WAY

"THE account given by Mr. Brander Matthews of the tactful way in which Pope Pius IX greeted foreigners who were presented to him reminds me," says a correspondent, "of a well-authenticated story of Lafayette. In the great Frenchman's tour of America in 1824 he was greeted as he approached the village of Canandaigua, New York, by a delegation of prominent citizens headed by a band, and in the evening was given reception at the hotel. As the villagers, intent on doing honor to the distinguished visitor, were presented one after the other, his invariable greeting upon shaking hands was: 'I am glad to meet you, sir. Are you married?' If the reply was an affirmative, his response was: 'I congratulate you, sir. What a happy man you must be!' If the man confessed he was unmarried, the response was the same: 'I congratulate you, sir. What a happy man you must be!'"

The "man who broke the bank at Monte Carlo" recently died—broke, according to a cable despatch. He was the hero of a song that was the most

Companions and Domestic Helpers

TRAINED, experienced, middle-aged woman wants position. School, small institution, private home considered. References exchanged. 1,878, Outlook.

MANAGING housekeeper. Will go to California. Five years' experience in Pasadena. 1,883, Outlook.

NURSE with business and hospital training desires position in fraternity house, private or parochial school, as housekeeper. References. 1,879, Outlook.

WOMAN, cultured, ambitious, versatile, thoroughly experienced and capable, desires position manager, housekeeper, companion, general factotum—household or exclusive institution. Excellent buyer, hostess, etc. Also able to superintend grounds and garden. 1,884, Outlook.

Teachers and Governesses

TUTOR—An experienced tutor wants pupils for summer in elementary or high school subjects. Address Box 54, R. F. D. 2, Farmingdale, N. J., or phone Farmingdale 38 F 5.

LADY, teacher piano and violin, desires position for coming season. New England Conservatory graduate. Experienced. 1,876, Outlook.

COLUMBIA senior, experienced teacher, would tutor child in return for home. Miss Ferguson, Camp Twa-ne-ko-tah, Chautauqua, N. Y.

MISCELLANEOUS

TO young women desiring training in the care of obstetrical patients a very thorough nurses' aid course of six months is offered by the Lying-In Hospital, 307 Second Ave., New York. Monthly allowance and full maintenance is furnished. For further information address Directress of Nurses.

MISS Guthman, New York shopper, will shop for you, services free. No samples. References. 309 West 99th St.

BOOKKEEPING in a week. Dukes, 1876 Walton Ave., New York.

BOYS wanted, 500 boys wanted to sell The Outlook each week. No investment necessary. Write for selling plan. Carrier Department, The Outlook Company, 381 Fourth Ave., New York City.

M. W. Wightman & Co. Shopping Agency, established 1895. No charge; prompt delivery, 25 West 24th St., New York.

AMBITIOUS WRITERS send to-day for free copy America's leading magazine for writers of photoplays, stories, poems, songs. Instructive, helpful. Writer's Digest, 688 Butler Building, Cincinnati.

SPECIAL HOME CARE FOR INVALIDS AND CONVALESCENTS. We are now prepared to receive invalids and convalescents and give them special home care. Personal supervision of diet and nursing, giving special attention to the personal comfort of all patients at moderate rates. 1,865, Outlook.

CO-OPERATIVE home-making. Opportunity for woman of education and refinement to share spinster's simple house on 50-50 basis. Pleasant modern home, attractive New England town. 1,896, Outlook.

Marietta Cox, Greencastle, Ind.

"We are advertised by our loving friends."

Mellin's Food Babies

Thousands of mothers can testify that the Mellin's Food Method of Milk Modification satisfactorily solved their infant feeding problems.

Write today and ask us to send you a Free Trial Bottle of Mellin's Food and a copy of our book, "The Care and Feeding of Infants."

Mellin's Food Co., Boston, Mass.

Robert E. Wright, Wooster, Ohio

An Unusual Service for Outlook Readers

You are frequently in need of a household helper, companion, nurse, governess, teacher, or business or professional assistant. Or perhaps you are in search of such a position yourself.

In either case, an Outlook "Want Ad" will undoubtedly solve the problem. Here is a typical extract from a letter just received—"I had not anticipated that my ad would prove so alluring. I received twenty-four replies and they came from thirteen different States. It has given me a great respect for the wide circulation of The Outlook."

Try a "Want Ad."

The rate is only Ten Cents a Word.

BY THE WAY—(Continued)

popular hit of its day, thirty or more years ago. He was also the author of an "infallible" system by which he claimed any roulette wheel might be beaten by a player with a sufficient bankroll. It is said, however, that his famous *coup* in the early nineties was the result of pure luck and was never repeated.

Authors often receive curious letters about their books. In a collection of such letters published in the New York "Herald" one received by Mr. Ernest Poole is perhaps the most amusing. It reads:

I have read a book of yours and it has occurred to me that you might be my uncle, Ern Poole. Uncle Ern left home about ten years ago. He said he meant to write for a living, but we have never heard of him since till I read your book. Now if you are my Uncle Ern I want to tell you what I think of the way you left my poor widow mother and have not even written her since—Dear Sir—if you are not Uncle Ern please pardon this presumptuous letter—but if you are, you're a coward and sneak and a quitter for running away like that. If you are not, please excuse this.

A tribute to Washington's athletic prowess is paid by a baseball player who writes to a daily paper that he himself had tried to emulate Washington's feat of throwing a silver dollar across the Rappahannock River and ignominiously failed. As Washington "could not tell a lie," the baseball man concludes, "I believe the story on the ground" (pretty well trodden, we may add in reprinting this well-known quip). "that a dollar went further in Washington's day than ours."

The downfall of Austrian currency is humorously hit off by the following story which is being circulated in Germany, whose own currency is rapidly following the Austrian:

An Austrian was placed in an insane asylum just before the war. A few weeks ago, so the story runs, he managed to find his clothes and escape from the asylum. He hailed a taxicab and after riding many miles got out and asked the price of his ride. The driver replied that the bill was 18,000 kronen. The lunatic, fumbling in his clothes, found a twenty-kronen gold piece and tendered it with profuse apologies.

"But that's quite all right. I have the change," said the cabman.

"Change?" said the astonished man.

"Yes, you have 30,000 kronen coming," replied the driver, hauling out a huge bundle of notes.

"Just keep it," said the perplexed lunatic, "and drive me back to the asylum."

The best photoplays of the year ending July 1, 1922, according to a contributor to the "Photoplay Magazine," are these: "Tol'able David," "Orphans of the Storm," "Hungry Hearts," "The Three Musketeers," "Bits of Life," "The Loves of Pharaoh," "Foolish Wives," and "One Glorious Day."

The Outlook

AUGUST 23, 1922

NORTHCLIFFE: JOURNALIST AND POLITICAL LEADER

VISCOUNT NORTHCLIFFE, who died in London on August 14 at the age of fifty-seven, was beyond doubt the most noted newspaper man of his time. His influence and power were derived not simply from any individual force as a writer, but from his tremendous energy as an organizer and controller and from his equally forceful ability as an independent and aggressive fighter for issues he believed to be vital. It would be impossible, therefore, to separate his accomplishment as a journalist from that of his activity as a leader of public opinion. Sometimes he was right, sometimes he was wrong, but he always aimed to lead rather than to follow. Added to this was his surprising skill at selecting men to carry out his ideas loyally and on the precise lines he had laid down.

When Lord Northcliffe died, he controlled the London "Times," the "Daily Mail," the "Evening News," and a long list of minor periodicals and magazines. He had attained this journalistic pre-eminence in a career of little over thirty years. As Alfred Harmsworth, his early journalistic activities were of the humblest kind. His start towards success began with the popularity of a little periodical called "Answers" which catered to the popular liking for smartly written replies to correspondents and to the love of odd and curious miscellany. It is said that his first attempt to enlarge his audience was the publishing of a "Great Extra Double Summer Holiday Seaside Number" of "Answers." In seven years from this time he owned more than thirty periodicals, ranging from "Comic Cuts" to a monthly magazine. A complete list of his periodicals printed in the New York "Times" names nearly or quite one hundred publications, no less than seventy-six of which have to do with fun, fashions, sports, women, boys, or girls.

Harmsworth entered the field of daily journalism by buying the "Evening News," then in a very weak and unprofitable state. His success as a daily newspaper man was almost immediate. He ran up the circulation enormously and made large profits. Instead of being satisfied with this success, as most men might be, he entered what was one of his most important ventures by gaining control of the "Daily Mail." It is a well-known fact that he spent a large sum of money, much time, and unending pains in getting the "Daily Mail" as he wanted

it to be before offering it to the public. The paper was written and prepared (news, telegrams, editorials, and all) day after day for three months. It was put in type exactly as any paper might

Underwood

LORD NORTHCLIFFE, ON HIS LAST VISIT TO AMERICA

be, but only a few copies were printed. These were seen by the staff only, who criticised, studied, planned, and brought their model into the shape that best suited the proprietor before a single copy was sold to the public. It was charged by conservatives that Northcliffe introduced American methods into English journalism; at all events, he made his new paper everything that was enterprising and graphic, and cast aside whenever he chose existing British theories and practices in newspaper work.

Still unbounded in his ambition, Northcliffe acquired financial control of the "Times," the paper which so long

had stood for dignity and political influence in English history. He showed his genius and intelligence by keeping the two newspapers he owned quite different in character and effort. Both have been eminently successful, each in its own field. The "Mail" is immensely popular and readable; the "Times" retains much of its ancient dignity, but in many ways, and particularly in its "Literary Supplement," is more readable, more modern, and less austere than the "Times" edited by Delane. The whole story of Northcliffe's journalistic career reads like a romance, and it was possible only with a man of boundless courage and equally boundless energy and versatility.

NORTHCLIFFE'S LEADERSHIP IN THE WAR

POLITICALLY, Lord Northcliffe was a man who made enemies as well as friends. His motto was "Pitiless publicity," and if purpose and conviction animated him he would attack a Prime Minister as readily as he would a brother journalist.

In the World War he was a thorn in the flesh of the Government whenever he thought new measures were necessary or that old abuses needed weeding out. His campaign in behalf of high explosives for the British army, and incidentally against Lord Kitchener, brought down a storm of protest on his head; he even saw piles of copies of his newspapers burned in public in London streets as a sign of popular hatred; yet no one doubts to-day that the British army was sorely in need of high explosives and more shells. He advocated conscription before public opinion was ready to accept it. But conscription was inevitable, and it came. He demanded a small and efficient War Cabinet, and was supported in this by Lloyd George, with the result that Asquith resigned as Premier and Lloyd George succeeded him. He fiercely attacked the Government for its errors in the campaigns of Gallipoli and Mesopotamia, and, while the criticisms may have done no good, they were deserved. His work as director of the Allies' propaganda in enemy countries during the war was remarkable; the highest German authorities have admitted that it was far in advance of anything of the kind they had done.

Even before the war Northcliffe was one of the few men awake to the German menace, and in 1909 he used the words, "Great Britain's dear friend,

Germany, is preparing for nothing short of war against her." Soon afterward he declared that the German building of Zeppelins was really a war measure and urged the building of a great English air fleet. Lord Northcliffe's controversies with Lloyd George have been vigorous on both sides. But he certainly sustained the Prime Minister in all efficient war measures and over and over again recognized Lloyd George's ability. The last of Northcliffe's controversies with Lloyd George was in regard to the present relations between France and Germany. Northcliffe, down to the moment of his collapse, fought with his accustomed vigor in behalf of the preservation of the Entente and the recognition of France's needs and rights. He said many bitter things about what he considered Lloyd George's weakness as to German reparations and in dealing with the Russian situation.

NORTHCLIFFE'S PUBLIC SERVICES

OPINIONS will differ as to the total value of Lord Northcliffe's public activity. Yet when one considers its chief objects and results and ignores the personalities and sensationalism that accompanied it, it must be admitted that he was substantially right in a large number of his contentions. Incidentally, through his papers he did a great deal for public comfort in his fight for pure milk, his encouragement of cottage building, the standardizing of bread in England, his Santa Claus Fund, and probably a dozen other helpful agitations.

Lord Northcliffe was always interested in America and an advocate of Anglo-American friendship. The American Ambassador to Great Britain, Mr. Harvey, said in commenting on Northcliffe's career: "It was a cardinal tenet of his faith that perpetuation of civilization could be assured only by mutuality of purpose and action on the part of our two countries, and he actually did more, perhaps, than any other one man, living or dead, to attain fulfillment of that noble aspiration."

Even Northcliffe's journalistic rivals generously and cordially admit the value of his work. The "Morning Post" declares: "His influence is destined long to survive him. It is consolidated in achievements which are enduring;" and the "Daily Telegraph" says, "He was a great man and a great Englishman."

A FRIEND OF IRISH PEACE

IT is easier, but not wiser, to follow a flag to the death than to recognize when the time for a just peace has arrived. Arthur Griffith, who died in Dublin on August 12, after a sudden collapse, was as ardent an advocate of

Irish independence as De Valera, but, unlike the latter, he was fighting for the substance and not the wording of the idea.

More than any other one man, Griffith exercised the influence that brought the saner Sinn Fein leaders to see that Dominion self-government in the hand is worth immeasurably more than a Republic in the bush. It has been said that in the early days of the Sinn Fein Michael Collins was its arm and Griffith its brain. It is to Collins's credit that he saw that Griffith was right and aided him in persuading other Irish negotiators in London to accept the terms upon which the Irish Free State is founded.

Griffith was in his early days a follower of Parnell; later he was a miner in South Africa, and is said to have got the idea of the Sinn Fein from the South African "Our Land" party. He was a prisoner of the British in 1921, and was released in order that he might take part in the London Conference. Padraic Colum described Griffith some months ago in the New York "Tribune" as "square, stolid, enlightened, persistent, devoted to his country." His loss to the Free State party and Government is a serious one, for he had balance and intelligence where too many Irish patriots have fervor and unreason.

IRISH IRREGULARS IN IRELAND AND AMERICA

THE retreat of the Irish "irregulars" from Cork and Limerick indicates that their resistance to the will of the Irish people, expressed in an indorsement of the Free State plan, is weakening and dying out.

The seizure of transatlantic cables by the insurgents was a sensational coup. Bold as the stroke was, however, and considerable as was the immediate inconvenience to commerce, it is not a body blow at the Free State, and may be compared to such acts in our own country as the recent stranding of railway passengers in the desert rather than to any large military action. Certainly the act has not endeared the Irish guerrilla forces to Americans.

By the way, it is amusing to note the present absence in our Congress and anti-British press of fulminations on the Irish question; so long as it was a case of England against Ireland we had plenty of it; now that it is Irish against Irish the anti-British agitators seem to be waiting to see which way the cat jumps.

ACCORD IN THE EAST, DISCORD IN EUROPE

WHILE gradual progress has been made toward the completion of an understanding among the Powers in the

Pacific Ocean and the Far East, practically no progress is evident in the development of an understanding among the European Powers concerning European questions.

There is fresh evidence of this fact.

Recently both Great Britain and Japan have ratified the treaty for the limitation of naval armaments. The three greatest naval Powers in the world have now committed themselves against continuing the old frantic race for naval supremacy.

At the same time there has been held a conference in London among the five nations which were, beside the United States, the chief allies in the war against the Central Powers. The outcome of this conference, which lasted over a week, has been, to use Poincaré's characteristically pungent phrase, "an accord to misunderstand each other." That conference was called to see if some understanding could not be reached concerning the problem of German reparations. To this conference at London the French Premier came with certain proposals. He was willing to agree to a moratorium for Germany, releasing her for the time being from the installments of the reparations which are now due, on condition that certain steps be taken to guarantee the payments. To the French suggestion, for example, that a sixty per cent share in the dye and other industries on the left bank of the Rhine be taken over, all the other countries in conference objected. To the French suggestion that certain of the German mines and forests be administered under Allied control, all but Belgium objected. Great Britain, of course, is interested in reviving trade; and of course anything that is done to put a burden upon Germany to repair the damage done in France interferes with trade. For example, any administration of German forests is likely to introduce a competitor with the Canadian lumber business. So France is prevented from securing guaranties with the aid of her friends, and she is denounced if she suggests getting guaranties without their aid.

It is alleged that Germany cannot pay because she is bankrupt. What seems to be forgotten is the difference between a government and a country. It is true that the German Government is bankrupt—but not Germany.

CUBA

ELSEWHERE in this issue we print some interesting correspondence about Cuba from a member of the staff of The Outlook. What our correspondent says is based upon a recent visit to the rich and beautiful island of the Caribbean, and it is confirmed by a

TREASON AND MURDER EVER KEPT TOGETHER

(Henry V, Act II, Scene 2)

Pease in the Newark Evening News

From an Associated Press despatch from Atlantic City, New Jersey, July 13.—Theodore Roosevelt, Assistant Secretary of the Navy, delivered the principal address to-day at the final session of the Benevolent and Protective Order of Elks.

"But a few short weeks ago," he said, "in southern Illinois, as atrocious a massacre occurred as is contained in our annals. Men were killed, not cleanly killed, but brutally killed, and up to the time in which I speak there is no shadow of a conviction of the

murderers in sight. I know not who was to blame, whether employer or employee—perhaps both—but if our country is to stand we must mete out justice in this case regardless of the affiliations. A blot of this kind on our escutcheon can be wiped out in one manner and one manner only, and that is by due process of law."

From an Associated Press despatch from Marion, Illinois, August 11.—State's Attorney Delos Rutty, Sheriff Melvin Thaxton, and other officials of Williamson County, working under

orders of W. J. Brundage, State Attorney-General, are gathering evidence against participants in the mine war at the strip pit of the Southern Illinois Coal Company at Herrin, near here, on June 21 and 22, in which nineteen non-union workers and three union miners were killed.

It was stated to-day by a county official that sufficient evidence has been collected to convict many participants in the disorders, but that complete evidence as to the mob leaders still is lacking.

Keystone

A SHIPPING BOARD COMMITTEE

In order to make a study of harbor conditions and to get views on shipping problems three prominent members of the United States Shipping Board, aboard the steamship Harvard, recently arrived at Los Angeles, California. Left to right in the group are: Fred L. Baker, of the Los Angeles Ship-building and Dry Dock Corporation; Admiral W. S. Benson, former Senator George E. Chamberlain, and Meyer Lissner, members of the Board; F. W. Relyea, district manager of the Board; and Earle M. Leaf, Vice-President and Secretary of the Los Angeles Ship-Building and Dry Dock Corporation

despatch from Havana to the New York "Times," dated August 6. This despatch quotes from a memorandum recently addressed by General Crowder to President Zayas, of Cuba. The memorandum deals with the financial and administrative deficiencies of the Cuban Government. General Crowder intimates that the present debts of the Government are being badly handled; that the administration of the Government is extravagant and wasteful; that economies of administration must be firmly insisted upon; that there must be a thorough and impartial investigation of the persistent charges of graft and corruption in the Cuban Customs and Internal Revenue Services; and that the Cuban judiciary is not in a healthy condition. General Crowder says that the reforms in the Cuban Government must be "of such character as to make it reasonably certain that the Government of the United States will never have to take steps, under the authority of the permanent treaty and Constitution of Cuba, to secure prompt payment of interest and sinking-fund charges on either the proposed new loan or the existing loans." In his opinion, "it is obvious that adequate assurance that the Government of the United States will be saved from this disagreeable duty under said treaty and Constitution must proceed from measures to be adopted by both legislative and executive branches of the Cuban Government."

General Crowder has been in Cuba for more than a year as personal representative of President Harding under the Platt Amendment, which provides for American approval of Cuban affairs. He is in Cuba with all the moral power, if not the official status, of a special Ambassador. While his memorandum to President Zayas was couched in the most courteous and diplomatic terms, it is a distinct intimation of possible intervention.

Cubans and Americans are fortunate in having such a man as General Crowder in the position which he occupies in Cuban affairs. He possesses both the highest integrity and the highest administrative skill. The way in which he devised and put into operation the system creating a citizen army of three million men under the Draft Law shows him to be a man of insight and genius.

SOME CONSTRUCTIVE WORK BY THE SHIPPING BOARD

WHILE two contending forces in the railway industry of the United States are in a struggle which is rapidly leading to the disintegration of railway transportation, the Shipping Board is hard at work on constructive plans to strengthen and improve transportation by sea.

A section of the Merchant Marine Act provides that the American importer and exporter may enjoy preferential freight rates lower than the domestic

rates for the same hauling in transporting his goods to or from the seaboard, provided these goods are exported or imported in American ships. The only condition upon which such low preferential rates are granted is that adequate shipping facilities are available on American vessels. This section of the Marine Act has never been enforced because the Shipping Board has been of the opinion that adequate American shipping facilities, as defined by the Act, have not yet been available.

The Shipping Board has now appointed a committee consisting of ex-Senator George E. Chamberlain, Admiral William S. Benson, and Mr. Meyer Lissner, all members of the Board, to investigate in person export and import facilities at Boston, New York, New Orleans, St. Louis, Chicago, Seattle, Portland (Oregon), San Francisco, and Los Angeles. The accompanying photograph shows the members of the committee and their aids and assistants arriving at Los Angeles.

In its work the Committee has inspected terminal facilities, harbors, warehouses, and docks, and has held hearings with local officials, civic organizations, and citizens on the subject. They have discovered the reasons why certain shippers still favor foreign lines, and their report, when published, will be a valuable contribution to a solution of the complicated problem of building up and maintaining an American merchant marine. We take the occasion to repeat again our wish that the Shipping Board might as rapidly as possible get out of the business of operating ships, and devote itself to scientific investigation, like that being made by the present Committee, which may form the basis of intelligent and just legislation for the regulation of transoceanic transportation.

LAWLESS AND INHUMAN

THE Vice-President of the Santa Fé Railway used exactly the right adjectives when he telegraphed to Warren Stone, Chief of the Brotherhood of Locomotive Engineers, that the treatment of passengers by employees of the Santa Fé was a "lawless and inhuman violation of their contracts."

Public indignation has rarely been aroused so strongly as in this instance. Without any declaration of a strike, without orders from their union, and without approval by the chiefs of their brotherhoods, engineers, conductors, and trainmen abandoned their service at Needles and other places. A large number of men, women, and children were not only delayed and annoyed, but suffered from intense heat and lack of food. To say that this conduct was inhuman

is to put it mildly. It will go far to alienate public sympathy with the railway workers in the present controversy.

We have looked in vain for an adequate condemnation of this act from the Chief of the Brotherhood of Locomotive Engineers. He is one of the oldest, best respected, and usually most moderate men among labor leaders. Yet he confines his comment on the act to a statement that this really atrocious conduct is illegal and unauthorized and that labor representatives have been sent to the locality involved to ask the men to return to work. An earnest expression of sincere sympathy with the people thus injured and of indignation toward those guilty would have been a simple act of justice and humane feeling on the part of Mr. Stone and the other heads of the brotherhoods.

It would also be well if a clearer statement than has yet appeared should be made by the union leaders as to the causes alleged for the defection of the men. To say that they will not work while State forces are guarding the shops against striking shopmen or to allege that the trainmen and engineers are asked to take out badly equipped trains and locomotives without giving facts in detail is weak and inadequate. The public is justified in believing that in point of fact these "rebel strikes" are really sympathetic strikes.

The men involved in these outrages have apparently forgotten that even in war women and children and non-combatants are exempt from attack.

MUSIC IN A DEMOCRACY

THE State of Pennsylvania has not been famous for excellence in government. Its progress has for many years been more or less bound hand and foot by a reactionary political machine. There are many signs, however, that the State is breaking its bands asunder. Some of them are political and some of them are educational and musical. And it is a phase of the latter which we here comment upon. The Educational Department of the State has taken on vision and vigorous life under the leadership of the new Commissioner, Thomas E. Finegan, who is setting up fresh modern ideals and standards throughout the whole educational system. He has the good sense to recognize the power and the function of music in a democracy. He brought from Cornell University to the State of Pennsylvania Dr. Hollis Dann, one of the famous directors of music in the country, and has put him at the head of the development of artistic and inspiring music for the schools of the Commonwealth.

This month a summer musical session under the direction of Dr. Dann is being

held at West Chester, thirty miles from Philadelphia, which is being attended by some five hundred supervisors of music from thirty-three States and the Dominion of Canada. A practical training in the teaching of music to the children is being given by members of a faculty chosen for proficiency from different parts of the United States, the children coming from homes near by. The chorus of hundreds of men and women of musical talent from the various States has attained a high degree of finish under its leader. Artistic technique is wrought into the fabric of the great folk-songs of America. What this chorus sings millions of boys and girls can sing. This great summer festival sets the ideal for the supervisors of music to carry out in every part of the United States.

It is to be hoped that Pennsylvania's musical policy will be imitated in her sister States. During the war we developed community singing to a high degree. We thought we needed it in war. We need it as much in peace. Leadership, co-operation, harmony—by the combination of these three factors music is produced. The habits of leadership, co-operation, harmony, wrought into the warp and woof of citizenship, were never more needed than now in this country. Music in the schools, under trained and inspiring directors, can do much to make these qualities habitual in our American democracy.

A CHECK IN THE PROGRESSIVE DRIVE

AFTER the succession of victories for progressive candidates in Republican primaries in Indiana, Pennsylvania, and Iowa, it may seem surprising that there should be no sign of vigorous life among the progressives of Ohio.

Carmi A. Thompson, the successful Republican candidate for Governor, is a stalwart regular. He was not, however, nominated because he was a regular, but because he was identified in the minds of the voters with the cause of prohibition. The result is sufficient to prove without a doubt that the Republican party of Ohio is overwhelmingly for the Prohibition Amendment, for the Volstead Act, and for their enforcement.

How far other factors entered into the contest is a matter for surmise. It is very possible that the Republican voters of Ohio were loth to give any indication that the party organization was not strong in the President's State.

The winner of the Republican nomination for the Senatorship was Simon D. Fess, one of the most experienced Representatives in Congress.

In the Democratic primaries A. V. Donahey was nominated as the Democratic candidate for Governor. Senator

Pomerene, a man of independence and ability, did not have the approval of the Anti-Saloon League, but was nominated to succeed himself. There was no indication that the Democratic party in Ohio is particularly dry.

THE COAL AND RAILWAY CRISIS

IN an editorial in last week's Outlook on the railway strike, we said:

The people of the United States are never going back to the period of irresponsible private operation of railways. They will either require successful operation under Government regulation or they will turn to Government ownership and operation. Now we do not advocate Government ownership and operation. We think we realize its economic, financial, and political dangers; but the American people are getting restive; their patience is being exhausted by broken-down locomotives, dilatory trains, and bad shipment of freight. The managers may say that it is not their fault; that it is the fault of perverse and obstinate workmen. If, however, the railway executives cannot find a way to get on with their employees, the people, in spite of the dangers of bureaucracy, will turn in impatience, if not in despair, to Uncle Sam.

This crisis has come sooner than we expected. The Governors of five States—Minnesota, Wisconsin, Iowa, South Dakota, and North Dakota—have met in conference at St. Paul and have jointly passed a resolution and telegraphed it to the President, saying that the "famine in fuel threatens the health and happiness of our people," and that, if he should deem it wise to seize the coal-carrying railways and the coal mines, "in order that the necessities of life of the people during the period of the present emergency may be provided for, such action will have the hearty approval of the executives of these five States, and we believe of the people whom we represent." This resolution will be found in full in a telegram which Governor Preus, of Minnesota, sends us at our request, and which is printed in a group of telegraphic expressions of opinion received by The Outlook, and published on another page of this issue.

The combined population of Minnesota, Wisconsin, Iowa, North Dakota, and South Dakota is nine million people. When the Governors of these five great, representative States of the Republic take the action they have in this crisis, it cannot be waved aside as impulsive or hysterical extravagance. We congratulate Governors Preus, Blaine, Kendall, McMaster, and Nestos upon their decisive courage. They at least are not "pussy-footing." Their telegram to

President Harding may at last make the slow-moving public realize that the coal and railway strikes have forced the country to the very edge of an abyss.

We are, in fact, in the midst of a kind of civil war. The capitalist managers are in one camp; the wage-paid workers are in the other. As in the case of all wars, the innocent bystander is the first to suffer. The farmers' crops are rotting; factories are threatened with shut-downs because of lack of fuel; railway accidents of one kind or another are becoming more frequent; and on the deserts of the Far West train crews, by abandoning their work, have jeopardized the health and welfare, and even the lives, of women and children.

Although we believe that we know some of the fundamental causes of this state of warfare, and can suggest some of the methods by which its repetition may be prevented in the future, we do not think this is the time to discuss the philosophy of the situation. It is a time, not for discussion, but for action. Some of the railway executives and coal operators want to be let alone in order to crush the unions by a fight to the finish; some of the strikers want to cripple or put out of business the railways and the mines, in order to terrify the public into recognizing their supremacy. But now is the time to assert and maintain that the only supreme power in a democracy is that of all the people expressed through the Government.

The Government of the United States cannot control the rainfall, the clouds, the sunshine, the winds, or the carbonizing of ancient tree-trunks into coal; but it can see that no class of men, whether capitalists or laborers, shall combine to prevent the people from enjoying the natural fruits of these processes of nature. There has been too much talk and too little action in the present emergency. The Government that does not exercise its legitimate authority and power to stop warfare over the necessities of life is a failure as a Government.

NEITHER FREE TRADE NOR CHINESE WALL

EVERY time Congress undertakes to enact a new general tariff law, politicians begin to tremble. They dare not leave the tariff alone, and they are afraid to touch it. If their memories are good, they recall the disastrous effects of past tariff legislation upon their party's fortunes. If they are Democrats, they remember the ill consequences of the Wilson Tariff Law in President Cleveland's second administra-

tion and the political peril (averted only by the outbreak of the European War in 1914) which was incurred by the Underwood Tariff. If they are Republicans, they remember the agitation against the Dingley Law and the catastrophe of Schedule K and President Taft's Winona speech. Each party in turn as it comes into power seems convinced that it has a popular mandate to revise the tariff and yet is apprehensive of the consequences of revision.

At the same time the people are confused and irritated. Clamor for a change in this schedule or that clashes with clamor for some other change or against change of any kind. Protective rates invoked in one quarter for the sake of the general welfare are denounced in other quarters as grants of privilege to special interests. Committees of Congress sit, make reports, and propose provisions. Representatives and Senators—especially Senators—make elaborate speeches (printed at the public expense and circulated through the mails without cost of postage). And the people throw the speeches into the waste-basket, read the headlines in the newspapers, and turn wearily away to something they think they can understand. The net result is that public opinion about the tariff bill becomes once more a vague but settled conviction that whatever Congress is doing about the tariff it is doing badly.

This is emphatically the case at present. What do the people generally know about the Tariff Bill now under discussion in the Senate? About its merits or its defects practically nothing. They have perhaps noticed that a proposal for an embargo on the importation of German dyes was defeated—at least temporarily—and that consequently some have asserted that the American dye industry, built up during the war, is probably doomed to extinction. They have read the reports of accusations that Senators financially interested in certain industries have voted for protective duties on the products of competing industries abroad. They have seen some reference to a debate about duties on gloves, and have read that hides are to be on the free list. They have possibly noticed that certain spokesmen for the farming population have changed their minds about the advantage to the farmers of high duties on agricultural products. They have seen some statement that the bill will place a heavy tariff on sugar and have wondered if that is going to make sugar more expensive. Such impressions as they have received are chance impressions, mutually unrelated, and conceived with no principle that they can discover. The general im-

pression they have of the tariff debate is that Congress is trying to make some kind of compromise to satisfy a large number of special interests, and that for a solution it may try as an experiment a plan of setting maximum and minimum rates, and then letting the President decide what the rates shall be from time to time between those two extremes.

This, we think, is about as near as the ordinary intelligent citizen who reads the newspapers gets to the truth concerning the Tariff Bill.

The reason for the fears of the politician and the confusion of the ordinary citizen is that there is not, and there has not been for many years, any clear division between the parties on the tariff. There has been no simple, clear, fundamental tariff policy that could be called Republican or Democratic. There have been slogans—"the full dinner-pail," "tariff for revenue only," and so on—but no principles. Both parties are by practice committed to tariff duties which in fact are protective. The only difference between the parties is a difference of emphasis, and nobody can clearly state, so that the plain people can understand, just where that emphasis is going to be placed.

To make that clear let us consider some simple, easily understood policies.

There are certainly at least three general tariff policies that a party might stand for.

It might declare that Government should adopt concerning international trade a doctrine of *laissez faire*—let it alone. It might say trade between nations ought to be absolutely unhindered, that each country ought to be allowed to produce and sell anywhere the goods it can produce most cheaply. This of course would mean that in one industry one country, in another industry another country, would have a virtual monopoly. Under such a policy, there would be the same freedom of trade that there is between the States of the American Union. At present there is no such freedom of trade, and there can be none by virtue of the action of any one or two or half a dozen countries alone. This policy, to be effective, would have to be adopted by virtually all the trading nations of the world. So no party in the United States could put such a policy into operation; but it could advocate it, agitate for it, declare that it would undertake to negotiate treaties to make it effective. It might say that if it were placed in power it would establish free trade between the United States and any other country that would agree to this policy.

Even if it did not propose to go as far as Great Britain did before the war and abolish practically all duties on imports

without reciprocal action on the part of any other nation, it might thus adopt as its permanent policy the ideal of international free trade.

This is something no party has ever done. It is true that some years ago the Democratic party was called by some of its opponents a free-trade party and that President Wilson hinted at international free trade as an ideal in his Fourteen Points. It is also true that the Republican party, led by Blaine, was persuaded to adopt officially a policy of reciprocity which logically would lead to the same thing. In practice, however, no American political party has adopted as a working policy the doctrine of *laissez faire*.

There is another equally simple, definite, fundamental policy which a political party might adopt. It might declare that the Government should erect an impassable tariff barrier against all foreign goods, or at least against all goods which might be manufactured here. This might be called the policy of the Chinese wall. This of course would mean that many things which other countries can manufacture cheaply would be manufactured in this country at a high cost, and would therefore become expensive; but it would make it possible for this country to be virtually self-contained and become a world in itself. It would mean the virtual extinction of all foreign trade except in such exceptional luxuries of an exotic sort that would have no effect on the life or industry of the American people. It would amount to a declaration of absolute commercial independence. This policy has in modern times never been attempted by any nation except Japan; and there it was carried out to an extreme that would be impossible in a nation like the United States. Nevertheless by means of tariff legislation foreign importations could be reduced to a negligible amount. A party might conceivably declare itself committed to this as an ideal, and legislate for the purpose of making the United States commercially independent and isolated.

This, again, is something no party has ever done. It is true that some high-protectionists have urged this as a desirable ideal; and in some cases, for special purposes, schedules have been devised which shut out certain classes of goods. In practice, however, no party has ever attempted to create out of American tariff duties a Chinese wall.

A third policy, which makes an ideal neither of free trade nor of isolation, is equally definite. It is the policy of adjustment or regulation. Its purpose is twofold, and must be twofold. It is designed to provide both revenue and protection. Sometimes the emphasis has

been laid on revenue, sometimes on protection; but it always combines the two. This is the policy of the United States under both political parties. It has never, in fact, been threatened. It is as firmly fixed as an American policy as it ever was. Though the tariff has often figured as a partisan issue in American political campaigns, it has never figured as a fundamental issue, for the simple reason that no party has ever proposed to depart from this simple policy of regulation and adjustment.

Next week we shall consider some of the aspects of this American policy in its recent development.

ENGLISH AND AMERICAN NOVELS

THERE has been lately in the London "Times," the American "Bookman," and other periodicals discussion about American novels in England and English novels in America. It has been petty rather than enlightening, because it has turned on alleged discrimination by publishers and critics from supposedly patriotic prejudice. Thus Mr. Sinclair Lewis is represented as saying in effect that the English writers are an effete crew lacking pep and go and with a supercilious attitude toward American books, and Shane Lewis as retorting that American writers are prone to mutual admiration. This is acrimonious but unconvincing. Not prejudice or patriotic leanings, but literary performance, is what tells in the long run. The best novels in the English language are read on both sides; the weaklings do not, as a rule, survive the passage.

But, if one is to compare the fiction output of the two countries, it must be admitted that firmness of texture and thoroughness of workmanship are more common in the English-made novel than in our own. The test is not the number of copies sold, but the interest shown by cultivated readers who care for the art of fiction writing rather than for temporary amusement or excitement. Of course there have been, and still are, American writers whose work is finished with care, whose characters stand out as solid persons and not sketchy types, whose central situations are vital and commanding. Hawthorne and Howells are examples in the past; to-day Edith Wharton, Winston Churchill, Booth Tarkington, Mrs. Deland, and a few others have just these attributes. But if we look over the American novels of a decade or so and compare them as a whole with what has come from the pens of Galsworthy, Conrad, Wells, Walpole, De Morgan, Locke, Merrick, and a

dozen other recognized English masters of the art, the reader who wants fiction that has quality will find the greater achievement abroad.

And this superiority of finish and leisurely completeness exists in English studies of single characters, and even in sensational novels as well as in those that go deeper into life. Where in American fiction of the last year or two, for instance, shall we find such clever pieces of work as Mrs. Kaye-Smith's "Joanna Godden," or Mr. Hutchinson's "If Winter Comes," or Sabbatini's "Scaramouche," or Mr. Milne's detective stories—the list might be extended indefinitely. The point is that, allowing for exceptions and for divergent tastes, our English friends score in their thoroughness of execution, while too many of our books are scamped, hurried, and sketchy.

Why is this so? Partly because the tradition of English novel-writing has grown up steadily and gradually; that branch of literature has in England been practiced longer and in a more professional way than it has been here. The American novel of to-day is the offspring of the Sunday-school book and the dime novel; some of us can remember the time when a novel without a didactic or moral purpose was looked at askance by truly good people. So our fiction has developed spasmodically and has tended unduly to stories with a purpose or (for the ungodly) tales of pirates, Indians, and the Wild West. Again, English society is more compact, its civilization is more homogeneous; even its class divisions aid the novelist in balancing his major and minor characters. England is small, and London has been its one great literary center from time immemorial. The novel has developed in an orderly, progressive fashion. Standards of workmanship and literary craft have become recognized in novel building. A type of English novel that is neither French nor American has evolved in which situation, character, incident, and humor play freely within a certain unity of design. In short, without being arbitrary or sweeping in judgment, one finds that the English novel is, on the average, more likely to be well thought out and carefully written than its American rival.

After all, however, there is no rigid nationality in genius. Schools of fiction may arise and fall, critics may bicker about the purpose of novel writing and weigh realism against romance, as they will, but once let a work of genius appear and theories are forgotten. The art of story-telling is a gift as well as an accomplishment. From Homer's day to ours he who can wave the enchanted wand will ever find enthralled followers.

SHALL THE GOVERNMENT SEIZE THE RAILWAYS AND COAL MINES?

TELEGRAMS ANSWERING THIS QUESTION FROM GOVERNOR PREUS, OF MINNESOTA; GOVERNOR BLAINE, OF WISCONSIN; GOVERNOR NESTOS, OF NORTH DAKOTA; GEORGE KENNAN; J. R. HOWARD; SENATOR BORAH; ROY D. CHAPIN; E. B. CORNWALL; A. L. GARFORD; SAMUEL GOMPERS; SENATOR LENROOT

OFFICIAL OPINION

PERHAPS the most startling event in the coal and railway crisis (during the week ending August 15, when this issue of The Outlook went to press) was the joint telegram of five Governors in the Northwest to President Harding suggesting that the Federal Government should seize and operate the coal mines and railways for the benefit of the public. Their action, taken on August 10, was briefly reported in the daily papers of August 11. On that day we telegraphed each of the five Governors as follows:

THE TELEGRAM

Have read with interest report of your conference at St. Paul. A telegraphic expression of your reasons for advising Government seizure of railroads and mines, two hundred words, night press rates collect, will greatly aid in forming intelligent public opinion and will oblige The Outlook.

New York, August 11, 1922.

There follow the telegraphic replies of the Governors of Minnesota, Wisconsin, and North Dakota.

Governor Preus, of Minnesota, is a Republican; thirty-nine years of age; born in Wisconsin; graduate of Luther College, Iowa, and of the University of Minnesota Law School; began his political career as secretary to United States Senator Knute Nelson, who has served over a quarter of a century in the upper house of Congress; has been Insurance Commissioner and Auditor of his State; was elected Governor in 1920; and is looked upon by his party as the probable successor of Senator Nelson.

Governor Blaine, of Wisconsin, is a Republican; forty-seven years of age; born in Wisconsin; educated at Valparaiso University; is a farmer and lawyer; has been in sympathy with Senator La Follette's leadership; formerly Attorney-General of his State, and now serving his first term as Governor.

Governor Nestos, of North Dakota. Independent, in a special recall election supplanted Governor Lynn Frazier, who had been elected in 1920 by the Non-Partisan League aided by Republicans. He represents the return of North Dakota to conservative-liberalism after its disappointment with Non-Partisan radicalism.

GOVERNOR PREUS'S TELEGRAM

The following is the resolution adopted by the five Governors of the Northwest States and presented to the President: "Whereas there exists an acute scarcity of coal due to labor dispute which has suspended the working of many mines and interrupted the functions of the railroads, and whereas this famine in fuel threatens the health and happiness of our people and imperils the prosperity of our business, therefore be it resolved, that we, the Governors of Minnesota, North Dakota, South Dakota, Wisconsin, and Iowa, do hereby assure the President of the United States that, if from the information at hand he believes it is wise to take over coal-loading carriers as defined in Service Order No. 23, or if he believes it is necessary to take over coal mines in order that the necessities of life of the people during the period of the present emergency may be provided for, such action will have hearty approval of executives of these five States, and we believe of the people whom we represent."

A gradual paralysis is creeping over the industries of the State of Minnesota and entire Northwest due to the lack of coal. The coal operators could have shipped their coal to Lake Superior Dock before the strike was declared on April 1, 1922, for they knew there would be such a strike. They failed to do so. Since the strike has been declared railroads have failed to supply the necessary number of cars to the non-union mines in Kentucky and West Virginia coal fields. The Northwest States have through long usage been accustomed to obtaining their fuel from Eastern coal fields. No coal is being produced in Illinois to supply our needs. The railroads have fallen down in making shipment from non-union mines since the strike was declared. Tremendous hardships face the Northwest, with its Arctic climate and its industries gradually closing down. While I am vigorously opposed to the Nationalization of mines or the Government operation of railroads, nevertheless in this emergency, where the coal operators and the railroad officials have proven their inefficiency, there may be no other remedy than the one referred to in our resolution. Have just received the following telegram from Governor Morgan, of West Virginia, which proves my contention that the railroads between the lower lake docks and the non union mines are unable

to meet the situation: "Your telegram from St. Paul received. Until railroad strike became acute, affecting locomotive power of railroads, West Virginia was producing coal in excess of her normal production, even exceeding her war-time activities, realizing that the Nation was dependent on her production to prevent domestic suffering and industrial paralysis. While railroad strike has curtailed production, West Virginia, despite coal strike, is in position to increase her output from one-half million to one million tons weekly if car service is provided by railroads. We appreciate your grave situation, and be assured that West Virginia will contribute to the full measure of her manpower and resources to assist you."

J. A. O. PREUS,
Governor of Minnesota.

St. Paul, Minnesota, August 12, 1922.

GOVERNOR BLAINE'S DESPATCH

At conference of Governors of Northwest States at St. Paul found that within less than three weeks there would be no coal in Northwest. Our climate is severe in winter. The very life of people at stake, and industries without coal must close, bringing distress to millions and more people. No greater crisis ever existed, and resumption in mining and rapid transportation is the immediate need of the hour to save the people. Government is instituted to promote and protect life and general welfare. This brief statement of the situation constitutes sufficient ground to justify Government operation of mines and coal carriers during emergency.

JOHN J. BLAINE,
Governor of Wisconsin.

Madison, Wisconsin, August 11, 1922.

TELEGRAM FROM GOVERNOR NESTOS

Statements of the press that the Governors' meeting in St. Paul advised the Government seizure of railroads and mines is stronger than warranted by the contents of the telegram sent the President. Governors were convinced that great distress would result unless a supply of coal was furnished the Northwest without delay. It seemed that the only source from which such coal could be secured soon was the non-union field of Kentucky and West Virginia, and the information at hand indicated that the railroad service between that field and the lake ports

had failed to function adequately or as expected. Statements in the press had already indicated a disposition on the part of the President to seize either the mines or the needed transportation systems if no other way could be found for solving the present problem and bringing the requisite fuel to our people. Believing that the President intended to use all proper means to secure a settlement of the strike and that the Fuel Administration would do everything in its power to get adequate coal shipments to the lake ports, we hoped that the problem could be solved under private ownership and operation of these mines and roads, but we desired to assure the President that if this should fail and if, in his judgment, it should become necessary for the preservation of the health and life of our people to seize either the coal-loading carriers or certain mines, we and the people we represented stood ready to support the President in such steps as he might find it necessary to take in order to meet this great emergency.

R. A. NESTOS,
Governor of North Dakota.

Bismarck, North Dakota, August 12, 1922.

GENERAL OPINION

In addition to telegraphing the five Northwest Governors we sent the following despatch to a list of men of public position and influence, representing various shades of public opinion—conservative and radical, capitalistic and laborite, urban and rural:

Inspired despatches from Washington intimate that the Government may be reluctantly forced to take over and operate the coal mines and railroads. Public opinion needs guidance in this crisis. Should the Government in the present exigency seize these public utilities? A telegraphic answer between twenty and two hun-

dred words, night press rate collect, will greatly oblige The Outlook.

New York, August 11, 1922.

We present here some thought-provoking telegrams received in reply to our question:

A LAST RESORT

George Kennan, the distinguished explorer of Russia and Siberia, who some years ago, as Special Correspondent of The Outlook, exposed the corruption and put an end to the political career of Senator Addicks in Delaware, and whose recently published life of E. H. Harriman is a monumental contribution to the history of American railway transportation, believes that Government operation of mines and railways would be a calamity, but may be forced upon the country by the present crisis.

Under normal conditions Government operation of railroads or mines is inefficient, wasteful, and politically inexpedient. As temporary emergency measure public safety may require it. In that case, strikers who refuse to accept decisions of Labor Board should be made the first sufferers from shortage of coal and transportation. Miners who will not produce coal should be the last to get it, and shopmen who will not repair locomotives and cars should be the last to receive necessities of life carried by rail. A single fruit grower of Medina will lose \$10,000 this year through lack of cars to move his peach crop. Why should strikers eat peaches or potatoes when they will not repair cars to carry them? Society has a supreme right to protect itself by withholding fuel and transportation from miners and shopmen who will neither work nor arbitrate. Executives should not be forced to break promises made to faithful employees, but if Government takes

control of course it may favor strikers at expense of loyal workers by *force majeure* and at its own risk. Government operation of public utilities, even temporarily, is only the lesser of two calamitous evils.

GEORGE KENNAN.

Medina, New York, August 11, 1922.

THE FARMERS' ATTITUDE

Two significant telegrams, one from Illinois and one from Vermont, indicate what we believe to be a general truth, that the American farmer is of a conservative temperament, and is reluctant to take any pronounced and sudden step towards the alteration of established American institutions or customs:

Railway Labor Board was organized as arbiter between employer and employee where serious disputes arise. It would be much better for the Government to insist upon obedience to its findings on the part of both roads and labor than to attempt to take over operation of lines, strengthening the authority of the Labor Board by amendments to law, if necessary. A similar impartially constituted arbitration of the coal situation should be demanded. When any party in any controversy refuses fair arbitration, it indicates a selfish and unfair disposition. The tendency of all people to lightly regard and disobey the law is deplorable. The Farmers of America insist upon a strict enforcement of State and Federal statutes, amending the same wherever they are unjust to any class.

J. R. HOWARD,

President American Farm Bureau.
Chicago, Illinois, August 11, 1922.

Am not in close enough touch with situation so that I can advise whether Government should take over and operate the coal mines or railroads. Will support Government in what-

THE COAL STRIKE

PROMINENT LABOR LEADERS AND LEGISLATORS IN A VOLUNTARY CONFERENCE ABOUT THE COAL SITUATION IN THE OFFICE OF SENATOR BORAH AT WASHINGTON

From left to right, the members of the group are seated as follows: Samuel Gompers, born in England, of Jewish ancestry, cigarmaker by trade, one of the great trade-union leaders of the world, President of the American Federation of Labor, generally called the "A. F. L.;" Edgar Wallace, legislative expert of the A. F. L.; Frank Morrison, a printer by trade and Secretary of the A. F. L.; Senator David I. Walsh, Democratic Senator from Massachusetts, a lawyer and banker, of Irish ancestry, graduate of Holy Cross College, honorary LL.D. of several Catholic universities, and one-time Governor of his State; Senator William E. Borah, lawyer, Republican, born in Illinois, educated at the University of Kansas, serving his third term as Senator from Idaho and one of the ablest and most distinguished personalities in the Senate; Senator William H. King, lawyer, born in Utah, educated at Brigham Young Academy and University of Utah, legal education at University of Michigan, Mormon of the progressive type, Democrat, now serving his first term in the Senate, where his seat is said to be somewhat precarious because of contentions within his party in Utah.

(C) Harris & Ewing

ever action it takes. Farmers have taken their deflation without strikes or other disturbance. Operators, manufacturers, and laborers should do the same. I believe in President Harding's proposal that a code should be drawn up covering principles which should govern decision in all labor disputes.

E. B. CORNWALL,
President Vermont Farm Bureau
Federation.

Burlington, Vermont, August 12, 1922.

The attitude of the American farmer interpreted by Messrs. Howard and Cornwall is confirmed by Mr. Wallace, Secretary of Agriculture. At a recent convention of Virginia farmers he said:

While making efforts to avoid heavy losses, the farmers have not struck. They have not created disorders. They have kept on producing and in the face of extraordinarily low prices have this year grown one of the largest crops in our entire history. The farmer is disgusted with recurring disputes between capital and labor. He is willing to produce food without interruption and has a right to demand that coal be mined continuously and that trains be kept moving. He calls upon capital and labor to cease their petty bickerings and resume production, trusting to American institutions and American sense of fair play to see that justice is done to both.

TWO MANUFACTURING VIEW-POINTS

Mr. Roy D. Chapin, President of the National Automobile Chamber of Commerce, agrees with Mr. Kennan that the seizure of mines and railroads by the Government should be avoided if possible:

Earnestly hope it will not be necessary for the Government to take over coal mines and railroads. Government operation destroys private initiative, which has contributed so greatly to the development of this country.

ROY D. CHAPIN.

Detroit, Michigan, August 11, 1922.

On the other hand, Mr. Arthur L. Garford, a widely known manufacturer with large interests in Ohio, thinks that the Government has parleyed long enough and should now exert its authority and control. Mr. Garford was candidate for Governor of Ohio on the Progressive party ticket in 1912.

The issue involved in the coal and railroad strikes is rapidly passing beyond the stage of parleyings and bargainings between operators and labor unions. On the part of both it is assuming the nature of an open challenge to the authority and power of Government. When any class, group, or organization sets itself up to function in the Government's stead and undertakes to deprive any citizen of his Constitutional rights or prevent the normal flow of business it is indeed high time that the inherent power of the people through their chosen representatives at Washington be made manifest and that such

instrumentalities of Government be employed as shall promote and safeguard the interests and welfare of the general public.

A. L. GARFORD.

Elyria, Ohio, August 11, 1922.

MR. GOMPERS'S REPLY

It is sometimes said that both the coal and railway trade unions are secretly or cunningly prolonging the strikes in order to force Government ownership and operation upon the country, in the belief that a solid labor vote can then control all industry. Mr. Gompers, President of the American Federation of Labor, does not take this view of the question. He has always consistently stood for private initiative and private profit in industry. We could wish that he were always as outspoken against violence and intimidation on the part of strikers. He wires The Outlook as follows:

There is no need for Government to seize either mines or railroads. Government interference already bears the responsibility for delayed settlement of the railroad strike, while the coal strike has fared no better because of Governmental maneuvers. The road to settlement lies in agreement between the employers and the workers in both industries. For the Government to take over either industry would be a purely unnecessary move, leading to no permanent solution, but leaving road open for a repetition of present difficulties. Whatever settlement is reached, it must be by agreement, for workers can never accept as permanent any terms or conditions to which they cannot give full agreement. Any method implying compulsory enforcement of terms is doomed to fail. The workers in both industries are, and have been, eager to confer and agree upon terms, and employers can at any moment go into conference and negotiate for full resumption of operations.

SAMUEL GOMPERS.

Washington, D. C., August 11, 1922.

SENATOR LENROOT ADVISES TEMPORARY GOVERNMENT OPERATION

Senator Borah, of Idaho, courteously telegraphs declining to express his views, on account of "the delicacy of the situation." Senator Lenroot, of Wisconsin, feels no such reluctance. We think Senator Lenroot is right. What is needed in a shipwreck or a fire is, not delicacy, but vigor and decision. It is not a question of hurting feelings but of saving lives that now confronts the country:

Unless coal strike and railroad strike is immediately settled I believe Government should take over sufficient coal mines to make up shortage, paying to miners old scale of wages pending investigation and determination of an impartial commission appointed by President. Believe Government should take over coal-carrying railroads to insure full and

efficient operation. Government operation of both mines and railroads to be temporary, only until their difficulties adjusted.

I. L. LENROOT.

Washington, D. C., August 11, 1922.

THE MIDDLE WEST

A lively controversy was stirred up three weeks ago in the Mississippi region by William Allen White's expression of sympathy with the striking miners and railway workers. How rapidly the railway men have lost public support is indicated by the most recent utterance of the distinguished editor of the Emporia, Kansas, "Gazette." In an editorial in his paper Mr. White says:

Leaving helpless people at Needles and Seligman on the desert in midsummer, without food or shelter save the little mite that the wayside towns provided, was cruel and cowardly. Such an act arouses the sense of fair play in American people at a time when only public sentiment can keep organized labor from a crushing defeat.

Why, in heaven's name, those fool trainmen who deserted their trains did not know that they were taking bread out of the mouths of hundreds of thousands of laborers who have honestly earned it is too much for the average man to understand. Union labor is having a fight for its very existence. This shopmen's strike was ill-timed, because public sentiment was not ready for it. But the shopmen, by their decent conduct, were swinging public sentiment to them, when bang! comes this action of the trainmen, and the public, which does not discriminate, swings back to the railroad owners. It is pitiful beyond words. Yet things are what they are and not what they should be.

The men who left those people to swelter and suffer out there on the desert were of course cowardly and ruthless. But cowardice and cruelty may be forgiven. However, such shameless, blatant folly, such hare-brained, lame-witted stupidity never will be forgiven.

If the men wanted to abandon their trains in Los Angeles or in San Bernardino, that was their royal privilege. But to take a thousand or two people who had done these trainmen no wrong to get even with employers 2,000 miles away was wicked and foolish beyond words, and the sad part of it is that the folly will be paid for in hundreds of thousands of workingmen's homes who are as blameless as the people marooned in the sand.

Why, in the name of all that is good and holy, can't labor get a little sense in fighting its battles?

These lines are written by one who believes in union labor, who is willing to fight, bleed, and die for union labor, but who would like to see labor use common sense, so that what it gains in one step is not lost in the next.

ON THE PACIFIC COAST

At our request, Mr. Sherman Rogers, Industrial Correspondent of The Outlook, who is now returning from a trip of

industrial and political investigation in Alaska, wires the following summary of Pacific Coast sentiment:

The shippers and business men of the coast section of the Northwest are keenly disappointed over the failure of the Administration to bring peace to the railroad situation. I have talked to many of the principal shippers and manufacturers and bankers of this section, and find that there is not the slightest sentiment for Government ownership of either coal mines or railroads. I did not find a single business man but what expressed in vigorous terms his approval of the railroads refusing to waive question of seniority rights after the rail officials had solemnly promised men permanent jobs. The business men do not feel that the strike is against rail heads, but purely a strike against a Government tribunal, and many have told me that they are willing to lose all they have

in upholding a principle rather than purchase peace at a price of unconditional surrender of business honor and public justice. Some business men express a desire for emergency Government control, but if drastic action becomes necessary the Government should specifically announce that Government control would cease immediately on termination of emergency. I have talked to scores of workingmen, and find that a majority are strongly against Government ownership of mines or railroads, but, without question, a majority of workers of all descriptions, both office and industrial, want the Government to temporarily take over both coal and railways to prevent the hardships that will follow in the wake of continued inactivity. One thing is certain, all factions here will welcome any vigorous action of the Government that will guarantee a fair arbitration of all questions involved. The principal criticism I have heard in

this section is directed against the Administration for lack of decisive action. This criticism is well distributed among all ranks. A majority of both business men and workers believe that the Labor Board cut too drastically, but business men point out that railroad heads paid increases when men got the wage raises and that labor should respect the Board's decision or appeal against their decision directly to the President for readjustment. Boiled down, sentiment here is that, while business and professional men are solidly against Government ownership of mines and rails, and a strong faction desire hands off be the cost what it may, a majority favor temporary Government operation if tie-up continues.

SHERMAN ROGERS.

Seattle, Washington, August 14, 1922.

The Outlook's views are set forth in an editorial on another page.

SERVING THE NATION WITH COAL
SPECIAL CORRESPONDENCE FROM WASHINGTON
BY HENRY L. SWEINHART

“ECONOMIZE and use substitutes!” Thus succinctly did Henry B. Spencer, recently appointed Federal Fuel Distributer, summarize what the people of the United States should do to eke out the coal supply which will be available for the needs of the Nation this winter, even with the strikers all back at work long before the snow flies.

There will be no coal to waste, even with all the mines in the country once more in full operation. No random distribution can be permitted if public utilities, homes, and industries throughout the length and breadth of the land are to be assured their necessary supply.

This epitomizes the point of view of the man who has been placed in administrative charge of the work of rationing coal for the Nation. He knows much of the meaning, as well as the practical side of coal distribution, because he was connected with the Fuel Administration office during the war. Furthermore, as a former vice-president of the Southern Railway Mr. Spencer gained much valuable experience for the emergency service work to which he has now been called by President Harding.

Seated in his small office in a former Washington apartment-house (commandeered by the Government during the war), surrounded by a comparatively small working force, Mr. Spencer keeps his hand on the coal nerve centers of the country, issuing or approving orders to distribute coal equably to all sections and localities of the United States. The Federal Fuel Distributer is like the commanding general at army headquarters; and assisting him in the field are a number of district committees who are on the ground in the various

(C) Harris & Ewing
HENRY B. SPENCER, FEDERAL COAL
ADMINISTRATOR

Mr. Spencer was formerly Vice-President of the Southern Railway and Federal Purchasing Agent for the war-time Railway Administration

coal-producing areas. In addition, there are the Governors' committees, whose purpose is to co-operate by furnishing statements of the coal needs of their respective States and by preventing profiteering and extortion in the sale and distribution of coal within their States.

After the coal strike had reached a point where it was seen it would be necessary to resort to emergency measures in order to secure equitable allotment of available supplies, the machinery for carrying out this programme was quickly put into operation. The President's Fuel Distribution Committee was named, with Secretary Hoover as Chairman; and with Attorney-General Daugherty, Secretary of the Interior Fall, Commissioner Aitchison, of the Inter-State Commerce Commission, and Mr. Spencer as members. The last named was appointed as administrative head to carry out the policies of the general Committee. On each of the district committees are a United States Navy officer, representing the Federal Fuel Distributer, a representative of the railway, and representatives of the coal companies operating in that territory. Stationed at each of the same points also is a service agent of the Inter-State Commerce Commission, whose object is to see to it that cars are allocated as needed in that particular district.

Under priority orders issued by the Inter-State Commerce Commission, the needs of the Nation are to be taken care of on the basis of their essential importance. In general, these provide coal distribution in the following order: public utilities and institutions, household use, industries which manufacture

COAL FIELDS OF THE UNITED STATES

Black areas represent fields now working and producing the bulk of the coal being mined; shaded areas represent strongly unionized fields where operations have practically stopped

public necessities, and, lastly, other industries. A special class, which may take precedence of all others, is left open "for such special purposes as may from time to time be specially designated." This will allow immediate attention to be given to any urgent demand that arises. The Northwestern States also, which must be taken care of early, while navigation on the Great Lakes is still open, are being given special attention, and an allotment of 250,000 tons a week is being shipped to that section of the country.

The Nation having gone through a coal strike of such long duration, careful distribution and proper conservation will be necessary for some time after the mines are producing their normal supply. How long a period would be required for this complete readjustment of industrial and household needs Mr. Spencer was not willing to predict when interviewed on this question. After the coal strike which occurred in 1919 only a few weeks were required after the miners had gone back to work to effect a situation where distribution once more took care of itself without any Governmental regulation. Conditions are different now, however, from what they were at that time, Mr. Spencer pointed out, and a considerably longer time may be required to restore the difference between supply and demand to a normal balance.

In any event, he added, as far as the

householders of the Nation are concerned, they should continue to go light on their coal supply throughout the early part of the winter, at any rate; and perhaps such wise economy may be necessary for a longer period, this depending on how fast the hard-coal supply can be put on the market and delivered after it is coming from the mines in normal amount.

Furthermore, substitutes for anthra-

Perry in the Portland Oregonian

YOU MAY GET THIS TOUCHING MELODY OVER YOUR RADIO NEXT WINTER

From Mrs. A. B. Wilson, Yakima, Wash.

cite may have to be used, especially in the early days of the winter. For this purpose coke, wood, and some of the better grades of bituminous should be available; and what hard coal the thrifty householder has in his cellar can be mixed with pea coal and some other of the smaller and cheaper grades which are not usually bought for domestic use. In this way the hard-coal supply will be brought back sooner to a normal surplus on hand.

In order that there may be a goodly supply of coke on hand—and this is the best substitute for hard coal—the industries of the country which secure large quantities of coke as a by-product of their manufacturing processes have been asked by the Federal Fuel Distributor to conserve this coke for domestic uses, instead of selling it, as they have in the past, to various metallurgical industries.

The supply of anthracite coal mined during the first seven months of the present year was only 22,800,000 tons, according to the official figures of the United States Geological Survey. This, compared with 54,500,000 in the corresponding period of last year, shows a decrease of almost 33,000,000 tons. The production of anthracite in July was only 116,000 tons, as against 7,308,000 tons in July, 1921. The quantity at the storage yards of the producers the first of the present month was small, and decreasing. These supplies, it was said, were mostly pea coal, all the larger

sizes of anthracite being practically exhausted.

The nineteenth week of the strike, ending August 12, showed a production of 4,800,000 tons of bituminous coal, an increase of 500,000 tons over the previous week, although it was only two-thirds of normal, the production in the corresponding week last year having been 7,771,000 tons. The bituminous production to date is 27,000,000 tons below what it was up to this time last year.

In the industrial field of fuel consumption, Federal Fuel Distributer Spencer does not think there should be any economizing which would interfere with the prompt restoration of business. Priority orders, of necessity, have limited certain industries; but it is his opinion that they should not be held back a minute longer than necessary, and that they should be given supplies of coal with which to steam ahead again as soon as there is no danger that the public utilities, household needs, and

essential industries will suffer from shortage. It should not take the bituminous as long to catch up on its normal surplus as it will take the anthracite; therefore Mr. Spencer warns the American home coal consumer to economize and use some substitutes, or mix his hard coal, even after his dealer is able to supply him; for the winter supply of anthracite may be a sort of month-to-month proposition. "Keep the home fires burning"—but not too high at first.

THE ITALIAN MUSS

DISORDERLY VIOLENCE IN THE NAME OF LAW AND ORDER—THE WARNING TO THE REST OF THE WORLD—STERN ADHERENCE TO A TRUISM

EDITORIAL CORRESPONDENCE FROM ITALY

BY ELBERT FRANCIS BALDWIN

IN traveling about Italy, as I have been doing for the past fortnight, I have seen no evidences of disorder. Yet they have existed. They have even provoked a Cabinet crisis—the brutal turning out of an excellent Ministry by the very forces that created it through their impulsive vote of "no confidence" in the Chamber of Deputies of the Italian Parliament. Such summary treatment has hardly had its parallel in the history of that Parliament.

Italy just now is an object-lesson to the rest of the world, and especially to other countries with similar conditions, dangers, and weaknesses.

Among other political forces in Italy, two in particular have for some time been struggling for mastery. One of these forces is Socialism. The other is "Fascismo"—from the old Roman "*fascis*," the emblem of law and order.

Socialism in Italy has been too much known, particularly abroad, by its extremes of anarchy, Bolshevism, and Communism; and "Fascismo," by its very opposite extremes of brutal revenge for Socialistic excesses. They created the inevitable reaction, which took upon itself the rough-and-ready enforcement of law and order whenever the Fascisti deemed the Government too weak to make "the punishment fit the crime."

The difficulty with these self-constituted guardians of the law, however, has been that their revengefully savage impulses have run away with them. For instance, in to-day's paper I read the following:

At Brandizzo the Fascisti, thirsting to avenge the assassination of one of their number by Communists, wrecked the Communist Club and the Bureau of Labor, burned their furniture and archives.
At Ravenna the Fascisti invaded the building of the Socialist Federation, wrecked it, and then burned it to the ground.
At Zanco the Fascisti, wanting to avenge the murder of the secretary of their local group, killed the Com-

A HALF HOUR WITH THE KING OF ITALY

Though much has happened in Italy since the accompanying correspondence was written in Turin, and though reports from certain parts of Italy have pictured local conditions here and there as resembling civil war, the Italian situation is now, and probably will continue for some time to be, essentially as Mr. Baldwin has described it.

Next week we shall print Mr. Baldwin's account of his audience with Victor Emmanuel III, of whom it has been said that if Italy were to become a republic he would be the most popular candidate for President.
—THE EDITORS.

munist Boario, a member of the Provincial Council.

At Rimini some Fascisti were seen to stop in front of the house of two Anarchists, who were later found murdered.

At Ferrara seven persons were killed, and at Ravenna nine, in conflicts between Socialists and Fascisti.

The Government has ordered the prefects of these regions to deport all non-residents and has concentrated the police and the troops wherever necessary.

Because of insufficiently timely concentration three Ministries have fallen recently—those under Signori Giolitti, Bonomi, and Facta. It has been extraordinarily difficult, of course, not to say impossible, for any Government to keep its police and troops "centered," for no one knows when and where trouble will break out next.

The Socialist situation was bad enough, in all conscience. The situation with the Fascisti, however, is worse, because it means persecution and illegality by those who ought to know better.

They have produced a condition dangerous both to individual liberty and to state authority.

The Fascisti now number hundreds of thousands of members. They are fairly well disciplined and armed and are ready for any necessary violence. They have also their sympathizers, and even their co-workers, in police and army ranks. A member of Parliament said the other day: "Look at those *carabinieri* who are on guard in this Chamber of Deputies. Search their pockets, and you will find, I will wager, that half of those men are carrying Fascismo membership cards."

Now no Government can view without alarm such an organization.

After the Facta Cabinet resigned, the Fascisti offered to collaborate in the formation of a new Ministry. This was embarrassing. Must the new Government thus formally recognize the illegal and revengeful Fascismo? Yet if it did not it would have the immediate enmity of the Fascist forces, and their particular revenge on Government officials would doubtless mean civil war.

An insurrection from self-constituted supporters of law and order might be worse for Italy than was the attempted insurrection last year of Anarchists and Bolsheviks.

The situation, bad enough, has now been complicated by the action of the Popolari, or Catholic, party. It announces that it will support no Cabinet which contains a Conservative member. But the only really possible Cabinet to-day in Italy is a Coalition Cabinet. It must be of course, while representing as many political groups as possible, a Ministry of concentration, a Ministry sternly approving the Constitution, a Ministry superior to the temporary passions of party. Only such a Ministry can meet present conditions and restore order, not in the name or for the sake of any particular party, but in the name and for the sake of Italy as a whole.

Turin, Italy, July 24, 1922.

YOKOHAMA'S CRISSCROSS CELEBRATIONS

SPECIAL CORRESPONDENCE

BY EMMA H. GUNTHER

Photograph by Emma H. Gunther

AS THE DENBY PARTY ARRIVED, THE RICKSHA MEN STOOD AWED

JULY FIRST.

Here in Yokohama! A festive time it is, for streets are vivid in their decorations, tall columns like red-and-white-striped barber poles supporting bright lanterns, the whole festooned with bunches of red and white flowers. But ought we be shouting with Yokohama or cheering for U. S. A.?

We ask our ricksha boy what the drums are beating about, what the firecrackers are shooting for? We of course are thinking of Secretary Denby's party coming next day and of the Fourth of July on its way. He answers with a quizzical look: "Yokohama ha'bor! Sitty-forth [sixty-fourth] year!" And then it dawns on us that a huge celebration lasting three days is planned for the anniversary of the opening of their harbor—July 1, 2, 3. Three days, and with Japan joining America on the Fourth, what a quartet of celebrations it will be!

The orchestra's programme starts with "Hail, Hail, the Gang's All Here!" Field-glasses tell us that the gunboat of the Asiatic fleet, with Admiral Strauss, is arriving. He has come to greet the Denby party to-morrow; the big "211" is on time from Shanghai!

Now fireworks shoot out from Yokohama Park; street bands are playing; lights are signaling from the top of our "211;" the first day's celebration and the "sitty-forth" are on!

SOME weeks ago we reported the invitation of Admiral Uriu, of Japan, to Secretary Denby, of the Navy Department, and the surviving members of the class of '81 at the Naval Academy at Annapolis to go to Japan to celebrate the fortieth reunion of their graduation. Admiral Uriu was himself a graduate and a classmate at Annapolis. The reunion almost exactly coincided with the anniversary of the visit of Admiral Perry to Japan in 1853, and did exactly coincide with the celebration of the effect of that visit—the opening of Japan, on July 4, 1859, to communication with the United States and ultimately with the rest of the world. Secretary Denby's party sailed on the transport Henderson. At the time we expressed the opinion that this trip might have been made on one of the finest battleships of the United States, with flags flying and bands playing, because nothing could do more to promote international friendship with Nippon than such a visit. The accompanying correspondence, which comes to us from a contributor who wrote it on board a transpacific liner returning from Japan, gives a little pen picture of the effect of this visit upon the "plain people"—to use Lincoln's fine phrase—of Japan.

THE EDITORS.

July Second.

Firecrackers usher in the day. To be sure, they are really for the "sitty-forth," but timely for the U. S. A. At eleven o'clock we discover airplanes swooping up and down, round about a ship in the distance. Several busy little Japanese destroyers are scurrying back and forth in front of that ship as if bowing their welcome. It is the Henderson, for now she appears in full sight, cannon are fired, and the United States transport carrying Secretary Denby and party is stationed in the bay. Launches steam up, carrying the welcoming advance guard of Japanese officials. We on the shore are busy speculating as to who's who and what's next.

"She's nosing to the pier now," cries a small American boy near. Rickshas take us down to the pier, and we are of the welcoming crowd. Japanese mothers and babies have come—in fact, whole families. Ricksha men in large groups stand awed—"This special group from America, this can be no ordinary landing," they seem to say. The transport is docked; Japanese officials on board; Secretary Denby and his party of about seventy are now really the guests of Japan. What are those tanned United

Photograph by Emma H. Gunther

JAPANESE WOMEN IN A SHELTERED PLACE ON THE DOCK

States sailor lads thinking, I wonder, as they peer out, their faces framed by the portholes of that ship?

Later, colored lanterns twinkle like so many fireflies along the bank; kimonos festive for celebrations look as gay as flowers in an old-fashioned garden; rockets are bursting; thrills for Japan—for the United States.

July Third.

There's a feel in the air of the approaching Fourth. Every little shop-keeper seems to have American flags of his own. He sticks them in a large Japanese jar in the doorway. Venders appear on the street; one carries a huge round tray on his head, a circular ruche, as it were, of small flags, and announces his coming by a loud gong. Hokey-pokey men are adopting red, white, and blue dingle-dangles on their carts.

Our hotel is the center for dinner and fireworks, so workmen are unfolding huge rolls of bunting and winding it about the broad pillars, while others are draping large American flags over the doorways. A bright illuminated shield of colored lights greets every incoming guest. American Stars and Stripes, coupled each time with Japanese flags, are bobbing over every chandelier, while in every basket of flowers on the tables American flags are standing up as pertly as if they, too, were growing in their own soil.

A Japanese wedding party claims our decorated rooms for the afternoon. The bride appears in one gorgeous kimono, now changes for others, as is the custom. The groups move about, a mass of harmonized colors. Old Glory looks on.

Towards evening the smell of fire-crackers is in the air; ships in the harbor are getting their streamers of flags ready to hoist next day; the French Consulate opposite is stringing red, white, and blue lights; a little Japanese lad goes by playing on his coveted mouth-organ—it is "Yankee Doodle."

July Fourth.

Instead, it is raining! It pours! It is Japan's Nubiai season in earnest. By noon notices appear: "No fireworks to-night." It takes ten hours of work to put up construction for set pieces in the water. The American boys in the hotel grunt their disappointment.

Seven hundred or more for dinner, and ten yen (five dollars) a plate. Cancellations are bound to come, for what is a dinner without fireworks afterward, even if the menu has such a distinct American flavor as to include New England turkey with Cape Cod cranberries, Maryland terrapin, Liberty ice-cream, and even Independence cakes?

July Sixth (is at last Fourth of July).

The first clear night has come. Literally thousands of Japanese are collecting for this event. Now a launch gayly bedecked with rows of lanterns; a sampan gliding on with one elongated lantern for its pilot; a flat, broad scow with room for dozens of guests plods along as jolly as the rest. The bay is dotted with hundreds of seacraft all hung with brilliant lanterns, making myriads of lights, row upon row, a wonderful medley of color. Guests of America!

Programme is on—bombshells, colored fires, gold fishes, aluminum bombshells, golden rain of fire, star mines, and fin-

ishing with the Capitol at Washington and the Tree of Liberty. But wait—here's the finale!

On the banks the kimono procession moves homeward, a solid mass of humanity guided by Japanese lanterns held high on rods in the hands of white-uniformed policemen. There they stand, a few feet apart, an illuminated dividing line between crowds moving north and south. Quiet, easily guided, superb in color effects!

Every boat begins to move back toward the canal; one by one they go, so solidly massed one wonders at the

skill of the oarsmen. They glide on, satisfied, happy!

It has been exactly thirty minutes. The crowd has dispersed; the last launch is slowly winding its way up the canal, the strains of music on board trailing on; the framework of all the fireworks down and carried away; the chief sends word to his forty policemen who have served in the vicinity, and they stand in two lines beneath our window; he thanks them for their service, they salute him; he returns the salute, and off they march, the lanterns going out one by one.

CHILDREN

IN THE DARK

BY REGINALD WRIGHT KAUFFMAN

(THROUGHOUT THE SOUTH OF FRANCE ON ALL SOULS' EVE EVERY GRAVE IS MARKED BY A LIGHTED LANTERN)

THE hillside graveyard all the night
Rocks with a flickering sheen of light,
Because the living people grace
With candles every resting-place.

I wonder if the weary men
That lie there waken up again
And grumble, on their couches deep,
Because the light disturbs their sleep,
Thinking, for just a moment, they
Must work through yet another day.

I wonder if the women there,
With dust of lilies in their hair,
Keep tight their lids against the gleam,
Lest it should drive away their dream.

But I am sure that there are those
To whom the lantern-candle glows
With all the gladness of a rose:
The little children that are dead,
They feel they have been long abed;
The dear, dead children greet each spark
With smiles, for children dread the dark.

ON THE SCALES

BY RUTH WRIGHT KAUFFMAN

WHAT do you weigh? You are so small!
Eight little pounds at seven weeks?
Eight little pounds—and that is all—
Of waving arms and rosy cheeks.

But we who tip a heavier scale,
What do we weigh, then, as a whole?
What do our pounds of flesh avail
Against your unweighed soul?

ENTER AUGUSTUS THOMAS

AN INTERVIEW

BY ROLLIN LYNDE HARTT

(C) Paul Thompson

AUGUSTUS THOMAS

A STUNNING portrait of Mr. Augustus Thomas adorns a "news pictorial" in the shop windows, while to the left Judge Landis is seen reigning over baseball and to the right Mr. Will H. Hays dominates the movies, and a caption below runs thus:

CZARS OF AMUSEMENT

Three Monarchs in a Republic are the Grand Rulers of Baseball, the Movies, and the Stage. Augustus Thomas, Famous Playwright, has Just Completed the Trio. The Producing Managers' Association have Appointed him Executive Chairman, which Makes him Supreme in his Field as Landis and Hays in theirs.

But what said Augustus Thomas when I talked with him to-day at the office of the Producing Managers' Association in Forty-fifth Street, close to the Great White Way? This: "I am not a 'czar.' I am not a 'monarch.' I am not a 'grand ruler.' I am not 'supreme.' Judge Landis can take a man off the ball field; I can't take a man out of a theater. A newspaper headline calls me an 'arbiter of morals.' I am not. My function is merely to preside at meetings of our Executive Committee."

Well, well! We can't believe everything we see in the shop windows, it seems—or everything we hear in theatrical circles, either. Only last night a very brilliant writer and director of plays warned me: "Careful! Don't be

too optimistic. This reputed get-good-quick scheme of the managers is in reality sheer camouflage. They pick out Thomas, with his unsullied reputation, give him \$25,000 a year, pass him off as an 'overlord,' and say, virtuously, 'Behold the sublimated angel of light we've hired! Now all will be for the best—will it not?—in the best of all possible Broadways.' Meanwhile they intend to go on, just as before, producing their nasty plays." In other words, the "enthronement" of "Cæsar Augustus" has "been arranged" purely in the hope of "heading off censorship."

I quoted this to Mr. Thomas. A good deal amused, though perhaps not altogether surprised, he replied, amiably, by reminding me that the plea for "censorship by citizens' jury" bore the signature, not only of the Authors' League, the Actors' Equity Association, the American Dramatists, the Better Public Shows Movement, and the New York Drama League, but of the Producing Managers' Association as well. They are opposed to political censorship. So is he. But he welcomes this other arrangement—the panel of three hundred good citizens to "protect the drama from fanatical interpretation of Blue Laws" and at the same time "eliminate contemptible, salacious plays, written from the catch-penny motive of appealing to the taste of a Peeping Tom."

The new Executive Chairman takes issue sharply with those who tell us that "such plays, never very profitable, die speedily a natural death if let alone," but he takes issue as sharply with the cynics who talk of "giving the public

what it wants." "It is absurd to call their patrons 'the public,'" he said. "They attract only a small section of the public—a section made up partly of travelers (the now-I'm-in-Paris kind) and partly of repeaters. Morbid people, sensationalists, are not content with seeing a scandalous play once. They come back. And again. And still again. That, and not a general depravity of human nature, is what makes scandalous plays profitable. They remain profitable until they have tired out the repeaters. Unfortunately, repeaters show great endurance."

For details regarding "censorship by citizens' jury" Mr. Thomas referred me to the last issue of the Authors' League Bulletin. By happy chance, it contains also an article reprinted from a theatrical magazine, the "Billboard," in which Mr. Patterson James declares, "The vast proportion of theatrical managers will produce anything so long as there is money in it," adding: "There is a stable that needs a Hercules. But who wants the job? I don't! Does Thomas?"

Officially, he has not got that job, or anything at all closely resembling it, yet he seems aware that his position is nevertheless one of real influence. Not a syllable to such effect do I recall, for new men taking new jobs are naturally a bit reticent. But, perhaps because he has been an actor, he managed somehow to convey the idea. Or did it reach me inferentially? This he did say: "Fifty-three producing managers, or ninety-six per cent of all the producing managers in America, belong to our Association," and it requires no extraordinary exercise of logic to perceive that, as Executive Chairman, Mr. Thomas may affect profoundly the future of the American stage. He believes in clean plays. Throughout his career he has demonstrated that they pay. And he possesses rare tact, rare persuasiveness. A test: During our talk we rambled off into the realm of psychic phenomena apropos of his play, "The Witching Hour." Almost at once we found ourselves holding opposite views. Yet, thanks to the man's unusual charm and magnetism, and to the coaxing way he has of ending a sentence with "Isn't it?" or "Don't you think so?" I became for once—oh, not acquiescent, quite, but at least concessive. What will happen, I wonder, when such a man as Thomas, with such a record, such impressiveness, and such facile diplomacy, gets to reasoning with the producers of "The Demi-Virgin," "Ladies' Night in a Turkish Bath," and "Getting Gertie's Garter?" Something notable, perhaps.

Ostensibly—I use the word in no opprobrious sense—ostensibly, it is for his diplomatic qualities that the Producing Managers have made Mr. Thomas their Executive Chairman. They have a blanket contract with the actors' organiza-

tion; under that contract individual contracts are made; when disputes arise, the Executive Committee deals with them in conference; and Mr. Thomas, with his endearing tact and amiability and with the further advantage of having no financial interest in any theater, is henceforth to preside. "There," he says, "is the anatomy of the thing."

But trouble is coming. Two years hence, when the existing contract has expired, the Producing Managers' Association will meet the challenge of the American Federation of Labor, with which the Equity is now affiliated. "You know what the American Federation of Labor has done to the Yiddish theaters," I said. He nodded. It was a compendious nod, meaning, as I thought, "I know other things besides"—things which doubtless accounted for the emphatic finality with which he said, *ex cathedra* as well as from private conviction, "I am against the closed shop."

Still, there was no rattling of the saber. Far from it. "Everything is settled in conference," he said. "Why not hope that these differences between the Producing Managers' Association and the A. F. L. can be settled in that way?" Why, indeed? He is there for the purpose. And yet—

It is always an affair of "and yet" when one reckons with a crisis two years away. Turning to another topic, quite, I recalled that not long ago Miss

Edith Ellis was asked, "What shall one do to become a successful dramatist?" and replied, "Be a foreigner." Himself at once an American and a successful dramatist, and now commanding influence of a high order with producers of plays, Augustus Thomas is in a position to promote native genius. "Why all these plays from abroad?" I inquired.

"Why all these paintings from abroad?" he rejoined. "Why all these jewels and gowns and *bibelots* from abroad? The fascinations of things foreign is perfectly natural, perfectly legitimate, and—perfectly unpreventable. Also harmless. Our American dramatists increase and multiply. When I first came to New York, who were they? Steele MacKaye and three or four others. Now we have a hundred American dramatists in one organization."

Miss Ellis had spoken, too, of what she termed the National uprising against Broadway—the development everywhere of "little theaters," of community drama, and of church theatricals "even among the Methodists." "It all helps the stage," said Thomas. And the movies help. When a fifteen-year-old girl has seen a proposal on the screen, she is more eager than ever to hear the living voice of a character in a play say, "I love you." We think in words. We enjoy thinking. And the movies are a song without thoughts because they are a song without words."

But thought comes dear at the theater, and the papers have been nudging Mr. Thomas as to that. When I brought up the question, he said: "Give us credit at least for fighting the speculators. This Association fathered a bill to restrain them from charging more than a fifty-cent advance over the face value of a ticket. The Governor has signed the bill. We are hoping that it will not be found unconstitutional."

Augustus Thomas was once a newspaper man. Before leaving I said: "What do you think of my performance as an interviewer? Have I brought everything out?" "Everything I am in a position to tell," he answered.

So this, then, was the "monarch" and "grand ruler," the "czar as supreme in his field as Landis and Hays in theirs." No doubt the papers will go on blithely assuming that all the theaters in the world now belong to one concern, of which Augustus Thomas is "dictator." That is their story; we may count on them to stick to it. But I fancy that Augustus Thomas gives thanks that no such alarming fate has befallen him. Who can predict how our rapidly growing class of "overlords" will look a few years hence? Perhaps funny. And Mr. Augustus Thomas is a humorist—wrote "The Earl of Pawtucket," if you recall. Like other humorists, he reverences a joke, but—"would rather see than be one."

SOME HAVANA SNAP-SHOTS

SPECIAL CORRESPONDENCE

NORTH AMERICA has but a hazy notion of what has been happening in Cuba. Americans may vaguely recall that General Leonard Wood cleaned up the island and set it on its feet and more recently that Cuba had a sugar boom which collapsed.

But America seems to be wholly unaware that Cuba regards intervention by the United States, under the terms of the Platt Amendment, as an imminent probability. It is generally considered that if the United States undertakes a third intervention it will be a friendly and peaceable one. And yet at least one Havana newspaper, "La Nacion," chants a sinister and persistent hymn of hate and declares that the day must come when hatred of the North American will be Cuba's new religion and Americans will be attacked on sight.

Intervention is an odious term, and, while I was told in Cuba that ninety per cent of the people would welcome intervention and the straightening out of Cuban affairs, the political job-holders would not like it and no one can forecast what the American-haters would start.

THE SWIFT TOOTH OF THE WORLD
TURNS TO CUBA

The performances of our boom towns at home have often been lively and ar-

International

GENERAL ENOCH CROWDER

resting. But these performances fade before the fantastic spectacle staged by Cuba during the recent times when the whole world, cut off by the war from other sugar supplies, turned to Cuba for all its sugar. The price of raw sugar

jumped from 1¼ cents to 23 cents, and Cuba very naturally went crazy. The pay of the blacks in the fields and mills jumped from 60 cents per day to \$8 per day. The whole island reeked with sudden riches, and some Cubans thought that before the boom was over they could make the world pay 50 cents for sugar.

A rush of real estate speculation swept Havana's outlying regions. Land hitherto worthless sold for \$25 to \$30 and \$40 per square meter. Parks, boulevards, bridges, marble fountains, monuments, and palatial mansions blossomed in the wilderness. A \$2,000,000 hotel, the Almendares, reared its marbles and tapestries in the middle of a cow pasture miles out of Havana; to-day it is closed and deserted, save for the cows that once more graze, but now in bewilderment, alongside its beautiful walls.

The gold towns, silver towns, cattle towns, and oil towns of the West have had their boomers, but it took Cuba to develop the world's champion of their kind. His name was José Lopez Rodriguez, familiarly known as Poté, meaning a cheap Spanish soup, a nickname suggested by his own slogan, "The pot boils." Poté was a humpbacked Jew, a native of Spain. He began his career in Cuba as a day-laborer, and then went to

Underwood

"QUINTA HIDALGO," THE "STATELY SPANISH MANSION WHICH HOUSES THE AMERICAN LEGATION IN HAVANA"

work in a printing-office and book-shop. Soon Poté was printing all of the lottery tickets, and his fortune was growing steadily. When the boom began, Poté bought some sugar mills, sold out at an enormous profit, and then embarked upon his master work, a two-mile addition outside of Havana.

THE BIG POT BOILS

The imaginative promoter cut down jungle bushes, leveled the rough manigua, and began lavish landscape gardening and incredible construction work. To-day Poté's addition is a marvel of residential beauty—only it is entirely without residents. Spanish mansions built of creamy marble, with stunning roofs of tile, ranged row upon row, with expensive lawns and sunken gardens between them, are fit for potentates and grandees. The wide boulevards are set off with marble pergolas and imposing monuments. Lagoons glisten in elegant parks.

No one has ever lived in Poté's addition; the houses were all built as come-ons; the boom collapsed before the new-rich could buy. Poté himself saw his fifty-million-dollar fortune oozing through his fingers until he had only eleven million dollars left. At this point, considering himself broke, Cuba's richest man hanged himself.

United States Senator Kenyon once paid a visit to Poté in Cuba. The Cuban inquired with interest regarding the United States Senate, its powers, and its methods of enacting laws. Poté was astonished to learn that it took a large number of Senators to enact legislation.

"Here I make the laws," declared Cuba's political boss. "No law goes on the books until I authorize it."

His personal habits were miserly, despite his free-handed squandering of money upon grotesque real estate pro-

motions. For years he lived in a hut, and often walked to save car-fare. Desiring a title, he picked up a smattering of pharmacy, which enabled him to go before the examining board and secure the right to sign certain initials after his name. In the yard of his home stands a large monument of Napoleon, whom he admired and of whom he undoubtedly considered himself to be the Cuban reincarnation. He secured the Government contract for the construction of part of the sea-wall on Havana's water-front. Much of Poté's wall has been beaten to pieces by the waves; that part of the sea-wall built by General Wood stands intact.

Poté's addition, which represented the actual expenditure of seven or eight million dollars, was put up for sale after the boom's collapse, on the following terms: \$100,000 down, and \$500,000 in four years, without interest. It was finally bought on those terms by one of Cuba's ex-Presidents.

BANKRUPT CUBA

Last year the workers in Cuban sugar-canes, instead of receiving the previous year's boom pay of \$8 per day, worked for 60 cents to \$1 per day, and have not yet been paid for last season's work. American bankers concluded that with this condition staring Cuba in the face there would be no sugar crop this year. But the unpaid laborers have remained at work, and this year's Cuban sugar crop totals 3,800,000 tons as against 3,900,000 tons last year.

The workers in the sugar industry are not alone in their peculiar willingness to stick to their jobs despite uncollected back pay. When I was in Cuba in June, neither the Havana police nor Cuban post-office clerks had been paid for two or three months. Perhaps it is the flamboyant "chocolate soldier" uniforms

worn by police officers that keeps them happy even during protracted periods of financial neglect.

One big bank after another began to cave in early in the fall of 1920. The Banco Nacional de Cuba failed with \$150,000,000 of deposits, and still owes more than \$53,000,000, of which \$20,000,000 is owed to the Government. This important bank closed on October 10, 1920, reopened for a short time later on, and closed for good a year ago. Among the other big failures were those of the Banco Español de la Isla de Cuba and the Banco Internacional de Cuba. Many smaller private banks have closed, and seventeen banks are now in the hands of a commission for liquidation. Of the defunct Banco Nacional the ambidextrous Poté had been vice-president and owner of a controlling interest of its stock.

The present administration of the Republic of Cuba, which went into office a year ago, found itself the inheritor of piles of debts and of a looted treasury. Cuban Government checks are to-day being discounted anywhere from 10 per cent to 30 per cent, and more than \$1,000,000 worth of Government checks are still drifting about marked "no funds."

Warrants have been issued for more than \$6,000,000 worth of work done by contractors on public works, for which no payment has been made, and for which no funds are available. Cuban importers are said to have repudiated millions of dollars' worth of debts to manufacturers in the United States.

Cuba's four external loans amount to \$66,500,000. Payment of interest on the first three of these loans was made possible by the fourth loan, which was effected this year. On Cuba's three internal loans, amounting to nearly \$50,000,000, interest has not been paid.

GENERAL CROWDER

In the stately Spanish mansion which houses the American Legation in Havana sits General Enoch H. Crowder. He has been in Cuba for more than a year as the personal representative of President Harding. Round the tall, spare, commanding figure of America's genius of the selective draft revolve the strange, secret currents of Cuba's national politics. General Crowder occupies the position of a sort of czar in Cuba. He is a firm but wise and kindly czar; and it is well for Cuba that it has Crowder. Too acutely conscious of the welfare of 3,000,000 Cubans to be stampeded by the natural desire for speedy intervention on the part of American business interests operating in Cuba, General Crowder deals with President Zayas and his Cabinet with clear-headed deliberation but with unfailing firmness. He talked to me very frankly at the Legation about America's responsibilities to Cuba and of the importance of deliberate action. A bachelor, he devotes himself day and night to problems connected with his mission. General

Crowder is in long and frequent conference with Dr. Zayas, who is described by one observer as a soft-spoken, quiet, kindly old man, a shrewd lawyer, and stubborn in his views.

The United States is understood to have demanded a full and clear moral readjustment in the Cuban Government; and a definite programme, based upon ten memoranda prepared by General Crowder and referred to by Havana newspapers as "Secretary Hughes's ten points," has been submitted. The Crowder election reforms, now in effect, embody a system of identification of voters, and have apparently accomplished all possible elimination of election confusion and frauds.

Graft seems to be Cuba's chief official ailment. But graft is nothing new in Cuba. When the fortress of Cabañas, which adjoins ancient Morro Castle, was completed, bills totaling \$14,000,000 were submitted to King Charles III of Spain. The Spanish ruler seized a telescope and leveled it in the direction of distant Cuba. When asked what he was looking for, he replied, "A fortress costing \$14,000,000 should be visible from Spain."

"ATTACK THE AMERICAN ON SIGHT"

Americans in Havana tell me that if intervention by the United States should occur it would be a friendly move; that it would mean taking over the customs, Treasury Department, and public works; and would include the installation of experts in finance, revenue, public works, sanitation, education, law, economy, and accountancy. It is estimated that a friendly intervention would cost the United States something like \$200,000 per year, including salaries, rents, and supplies.

But if the outspoken views of "La Nacion" may be taken at anything like their face value, then an American intervention might open the door to something more than friendly co-operation. "La Nacion" declared on June 21 of this year that America's co-operation with Cuba "has been the narcotic which has worked on our sentiments, preventing us from declaring all the damage which the Americans have done to us and protesting against the oppression which the Republic has suffered." And the same article continues:

That sentiment of gratitude no longer exists in the hearts of the Cuban people. The admiration which the American democracy produced in the unforgettable year of 1899 has been extinguished. We do not yet hate, but the time is coming when we shall be completely dominated by this passion. What we lack is hatred for North America. The hatred of the American will be our new religion. Our teachers will have to comply with this need of national sentiment. It is the immediate work of the Cuban school, of the Cuban and Spanish teachers who model the mind of the child. This seed must be planted in the heart of the infant. It must be cultivated and cared for until it reaches the proportions which will make of us another Ireland, beloved

Underwood

A CHARACTERISTIC SCENE IN HAVANA—VIEW OF A SIDE STREET

of death if by that means we can arrive at absolute and everlasting liberty.

HAVANA REMAINS CHARMING

But despite these ominous rumblings of an excited press, Havana remains charming and seductive to the visitor from the United States. You wander fascinatedly about among the shops whose awnings suspend languid canopies clear across streets scarcely wide enough for a Ford and shading sidewalks so narrow that you must proceed in single file.

It was on one of these Havana shopping tours that Joseph Hergesheimer, the American novelist, discovered a Spanish shawl that has since made a unique place for itself in literary gossip. This tenuous, creamy product of Spanish looms and needles, aflame with its brilliant colorings, gave the romanticist no rest. It happened that a popular American magazine had been making an unsuccessful effort to secure a serial novel from Hergesheimer. The latter, remembering this, impulsively cabled the magazine's publishers that he would write them a serial if they would buy him the shawl. The transaction was quickly closed, and the serial, appropriately entitled "The Bright Shawl," soon began its appearance.

Seemingly there is something or other to parade about every night in Havana. Drums, bands, firecrackers, fluttering banners, and marching feet may be heard almost every night along the Prado. Havana seems never to sleep save during the heat of the day, and even that is mitigated by innumerable arcades and awnings. Every building is romantic with balconies. Unlike the glaring white coral structures of Bermuda, Havana builds with soft, peach-colored stone and trims with cool pastel shades of blue and green and lavender.

The low buildings and inevitable balconies must be a constant lure to the porch-climbing temperament; but Latin ingenuity of the underworld seems to prefer to angle for its loot, and a friend of mine tells me of waking up one night to see his watch and chain floating weirdly through the air and out of the window. A fishing rod and line were the instruments of appropriation.

While your watch may be safer under your pillow than on the table, a resident of Havana assured us that street hold-ups are unknown, and that a stranger may taxi without fear through the most suspicious-looking of the narrow thoroughfares at any hour of the night. Under the flare of their curious old iron lamps Havana streets all have an inscrutable air of impending melodrama.

ECONOMIC INCOMPETENCE

Cuba's financial tribulations are not due to intrinsic reverses, but to economic incompetence and to burlesque politics. A one per cent sales tax and an eight per cent profits tax on all classes of business have been imposed to renew public funds. The riches of Cuban soil and climate are almost incredible. A tobacco crop is grown in ninety days, at a profit of \$500 per acre, and sugar-cane bears nine crops after one planting, and may be grown for fifty years on the same soil without transplanting. The world seems entitled to reasonable benefits from these natural riches, isled in Cuba's hotbed of fertility, without the interference of the childish pranks of Cuba's burlesque politicians. But just how much it is the business of outsiders to meddle with Cuban notions of conduct is still to be decided. There is a world of difference, however, between the butchery of General Weyler and the healing hand of General Crowder.

NEWTON FUESLE.

On board S.S. "Ulua" in the Caribbean.

BY THE BLACK HEARTHSTONE

BY ARCHIBALD RUTLEDGE

It was a seashore as wild as that over which Prospero held mystic sway; and to the west of the shore-line rose the velvet-purple wall of a forest every whit as primeval as Evangeline's. From the far-stretching marshes curlew whistled humanly, something aware of mortal trouble; from the moldering forest, steeped in ancient peace, a great horned owl voiced impressively his stately sorrow. Moonlight marbled the sand beach, and by its enchanting wand even the somber pines were tinged with a faint, austere light. It was the deep of night; midnight and forest mystery and sea mystery. Eerie and glamorous was the scene. The place appeared to be a stage set for fairy rites. It seemed like what Milton must have had in mind when he wrote:

The sounds and seas with all their
finny drove
Now to the moon in wavering mor-
rice move;
And on the tawny sands and shelves
Trip the pert fairies and the dapper
elves.

Yet on this lonely sea beach, redolent of romance, were no supernatural creatures—only two human beings of ordinary inconsequence, and before them ambled an old dog of obscurest pedigree. You see, Sam Weston and I were out hunting raccoons.

That was thirty years ago, when Sam and I were boys. Though he was black and I was white, we seemed to have the same appreciation of many things, and particularly of the sport of following the wise and wily raccoon through the pine forest and along the sea beach. In the deep and gloomy woods that fringe that region of the Carolina coast, on the hummocks in the broad salt marshes, in the semi-tropical jungle of the coastal waste lands we followed our game. Our comradeship had all the tacit and genial understanding that is common to youth. We were simply friends.

But then I became bound to education, while Sam remained free. Moreover, though I regularly revisited my old homeland haunts, it just happened that Sam and I did not meet. And, as has been said, thirty years passed.

Recently when I was at home my brother said to me one Sunday morning: "Don't you want to drive out with me to see Sam Weston? He is always asking about you. He lives about a mile from the village here. I want to talk with him about some carpentering; he's the best carpenter we have in this country now," he added.

A brief drive along a fragrant pine-land road bordered by aromatic hedges of cedar and myrtle brought us to Sam

Weston's house. It was small, homelike, immaculate. In the front yard trim little flower-beds were laid out; their borders were carefully kept by conch-shells. On either side of the door were tied handsome bunches of cape grass, which Sam had evidently gathered on some late trip to the beaches. I noticed that he had about ten acres of land fences behind his house. The toil required to clear such a tract must have been considerable; for it was land obstinately wrested from the ancient primeval grasp of a moldering swamp. Dankly the swamp glimmered upon the small, sweet, triumphant clearing that the man had won from it.

At our rap the door was opened and Sam welcomed us. And for a few moments thereafter I could think of nothing but:

Shepherd, I take thy honest-offered
courtesy,
Which is oft sooner found in lowly
sheds
With smoky rafters, than in tapestry
halls
And courts of princes, where it first
was named
And yet is most pretended.

And here I want to bear testimony that the Negro has the grace of heart to be as genuinely courteous as any man who walks the earth. And by *courteous* I do not mean merely kindly and hospitable: I mean that he can sense the fitness of things and that he knows something of the reticences and the deferences of heart. I take it that courtesy of this genuine sort is an excitingly authentic sign of character; and I know that I have found high and gentle courtesy in the Negro. Many a time by the black hearthstone I have been made welcome by an ingenuous and unaffected affection that reached my heart because it came from another's. Judge not the Negro's courtesy—or any man's—when you merely see him in a gang of track laborers, in a group working on the wharves of a seaport town, or in a gang toiling with pick and shovel along the highroad. You may, indeed, in a sense, judge him in such situations; and you will probably find him to be as cheerful and as willing a workman as you have any right to expect any man similarly placed to be. Yet if you would really know the Negro, you will have to sit with him beside the black hearthstone. To know any man you must see him at home, beside his own hearth. Come with me to Sam Weston's fireside.

The three of us sat before the genial fire of lightwood and scrub-oak; and as I looked at Sam, over me came a flood of memories. He had aged, his hair was tinged with gray; but he had not

changed. I saw at once that, instead of permitting life to mar him, he had compelled life (in the grim, implacable struggle that every one has to meet) to make a man of him. Small in stature, muscular in a lithe hard way, with a sharp face evidencing quick perception and restless, almost imperious energy, this good Negro with whom I used so often to follow the hounds on moonlit nights had in thirty years not altered so much as developed. I could now see in his face the same alert intelligence which I, as a boy, had learned to trust to take me out of difficult situations incident to midnight hunting. I could see the old understanding; I could sense the old affection. And to be conscious that early friendship remains unchanged by the years is one of the purest pleasures which life can afford. Physically of course time had changed Sam Weston in its wholesome fashion; but the character, by infallible signs readily detected, had undergone no change save that of sane and simple yet noble growth.

It was the old Sam who, with a quiet geniality that warmed our hearts, assured us that our visit was most welcome to him.

"Where are you working now?" I inquired.

"Down to the Point," he answered, referring to a section of the near-by seacoast town; "we are rebuilding the house that was burned."

"Who has charge of the work?"

"I look after it, sir."

My brother looked at me significantly. Sam's modesty was apparent.

"How many men do you have under you, Sam?"

"Eighteen this week," he said; "we are trying to finish the work so that the family can move in by the first of the year."

"Could you do a little work for me, Sam, some day this coming week?" my brother asked. "I have to get some gutters put on that back porch of mine, and you are the man to fix them."

"I done make a promise to finish the house," Sam said, and in his tone there was earnestness. "I wouldn't like to go back on my word. But I will come any afternoon after we knock off work for the day."

The day was forthwith fixed for the work; and I knew that the work was as good as done, and well done at that. There was no talk of the "eight-hour day," "time-and-a-half for overtime," and all the other formulas so current nowadays. Here was a man who was glad to get extra work; but he was likewise a man of his word—he would accept no

task until he had first done full duty to his first employer.

As I sat there listening to Sam's honest talk I wondered what more could be expected of a good workman than those very qualities which he so unconsciously yet so patently displayed: gladness to toil; readiness to come to an agreement with a decent employer; faithfulness to fulfill his word; cheerfulness over every prospect; efficiency; contentment in skillful service. There may be other qualities which a good workman should have; but if all workmen had those just enumerated the industrial deserts of the earth would be translated into oases where well forth clear springs and where bloom myrtles and roses.

From the Negro who was talking in his thoughtful, courteous way to my brother my gaze wandered about the room. The whole house, I knew, had been built by Sam; and this room had been finished with especial care. Over the fireplace-mantel the places of honor were given to two diplomas of secret-society membership. On the wall a few pictures were disposed. There was a faded photograph of a little boy Sam had lost. On the broad mantel—which was a slab of heart-cypress hewn out with a broadax from some patriarch of the swamp—I marked some trophies of wood and shore: the dropped antler of a whitetail stag, a huge shark hook, and a handful of alligator acorns. The room itself, in every detail, was spotlessly clean; the yellow-pine floor had been scrubbed until it literally glistened, the walls and ceiling had lately been painted. I thought: "This is like the home of a happy craftsman in a land where an ancient civilization prevails; here is a man who owns his house and his land, who loves his work, who is respected by the members of both races with whom he is thrown. He knows and enjoys the simpler—and by that I mean the genuine and fundamental—joys and sorrows of life. He is not in the least troubled in spirit because his position happens to be subordinate to that of some one else. Perhaps he has sensed the necessity of what Boswell termed the grand scheme of subordination, and appreciates the importunate truth of Johnson's fine saying: "There can be no order without subordination." Perhaps his spirit caught long ago the idea that Pope put so pregnantly into words:

Honor and shame from no condition
rise;
Act well your part, there all the
honor lies.

Here, then, is a humble workman acting his part most admirably; a craftsman of whom any civilization may be justly proud; for to the rearing of the vast temples of civilization the obscure artificers have as certain and as necessary work as those who project the tremendous plans, who

Think in gold and dream in silver,
Imagine in marble, and in bronze
conceive.

As we were leaving Sam Weston's home he asked us to wait a minute. He disappeared, telling us that he would meet us at the car. And there he met us, smiling, a chicken in one hand and a bag of peanuts in the other. They were gifts for us; nor did his courtesy cease with his gifts.

"If you could come out before day some morning this week," he said, "I would like to take you to a place in the marsh where plenty of mallard ducks are—out yonder near Jeremy Island, where we used to hunt 'coons," he added. "I could easy do it and get back in time for my work; or I could take you to the pond and leave you there for the shooting."

There surely can breathe no man with soul so dead as to refuse such an invitation. I accepted it—but for another year. I must pay my respects to those mallards; but, far more than that, I must renew my sporting comradeship with Sam.

You have seen the Negro at his hearthstone; you have seen him welcoming guests at his door and telling them good-by at his gate. I venture to say that you have seen the genuine man. Yet if you go to the movies, or if you read stories in magazines that have a few million a week circulation, or if you see him on the minstrel stage, you will get nothing but a pitiful caricature of the Negro. Inevitably he will be shown to be cowardly, absurd, pilfering, scheming, credulous, preposterous. If the characterizations were true, they might be ludicrous; but nearly all of them are shamelessly false. Long have I been amazed that the American public could be for so great a length of time so deeply deluded. Of course it depends on what the public wants: the truth or merely something to create laughter; a portrait or a cartoon—and even the cartoon lacking that crude sapience of justice that a good cartoon has; the mirror held up to nature or merely buffoonery and burlesque. If you would hear the oracle, go to the shrine; if you would know the present truth, and through it come to a clear understanding of it, and therefore to a sane vision of the future, visit the black hearthstone.

The popular idea of the Negro is as menacing to his and to the country's welfare as it is essentially false. To be definite, I should like to explode certain current misconceptions concerning him. It must be admitted that the Negro is pictured as a fearful being, afraid of the dark, of ghosts, of deserted houses, of wild animals. Now, as a matter of fact, the Negro will walk alone at night mile after mile through the loneliest country, and will have at least as little concern as the white man. I know well a Negro who received from the British Admiralty a medal for killing single-handed a notorious man-eating shark in the harbor of Bombay. I know another who went with a white man to a solitary

island to capture a herd of fierce wild cattle; and the white man told me that the Negro's nerve was something extraordinary. Lately, at Vancouver, there was buried a Negro, Joe Fortes by name, who for thirty years had been a member of the beach patrol, and as such had saved many lives. The esteem in which he was held may be judged by the fact that when he was buried—

the . . . port

Had seldom seen a costlier funeral.

It ought to be apparent that I am not saying that all Negroes are brave; such a statement cannot be made about the members of any race. But I do assert that the Negro has on many occasions showed himself to be a man of courage. I give one last instance of it: My father, a colonel in the Confederate army, had been wounded in the battle of Antietam. His body-servant then and throughout the Civil War was a Negro, Charlie Williamson. After the battle, when Lee began to recross the Potomac, there was a good deal of rear-guard fighting; and the nature of the country rendered this guerrilla work most effective. While fording the river on horseback my father, weak from his wound, which had not been dressed, fell from his horse. In the face of dangerous fire from Federals on the Maryland side of the river, Charlie waded back, drew my father out of the water, and carried him safely to the Virginia shore. I call that bravery; and it was other things as well—devotion and fidelity worthy of renown.

Another false impression of the Negro is that he lacks the humor which compels you to laugh with him, and has only the folly and the absurdity which make you laugh at him. As a matter of fact, the Negro's sense of humor is a part of his philosophy of life; it is not merely adventitious, it is natural. Yet no one who has not lived in the South can well appreciate its exact character or can realize the almost constant gentle raillery and genial badinage that are constantly employed among the Negroes themselves and between the two races. I have long believed that the Negro has all his humor (as he has most of his songs) tinged with fitful gleams from the moonlight of melancholy—the sure effect of one's accurate observation of life and reflection upon it. But sometimes the humor is infectious; always, I may say, it is spontaneous. In reparation its effect can be seen.

"Why, hello, Joshua!" said an old planter to an old Negro who had been his workman and something like his comrade since boyhood. "I see that all the old fools are not dead yet."

"No, sah," Joshua replied with a grin; "and I is glad to see you lookin' so well, Cap'n."

What has been said of courage and of humor in the Negro may also be said of other qualities which popular fancy denies him. Certain of these traits may

perhaps best be illustrated by another visit to the hearthstone.

UNTIL his affliction fell upon him Peter Small was an Esau of the finest order. The world is full of incipient and spurious woodcrafters; but this hunting comrade of mine was a genuine woodsman. Such, indeed, was my respect for his opinion in such matters that for years I seldom accepted as final any statement concerning wild life until I had had upon it the opinion of Peter. He taught me more about trapping the red fox, of finding the home of the otter, of locating the master bull among the alligators, and of a hundred other curious matters of nature than all the books I had ever read. Other Negroes might tell me of having seen droves of forty wild turkeys, or of having seen ten deer in one herd; but I would not be satisfied until I had seen and consulted Peter. He is a man of few and of final words. He always thinks carefully before answering; but the answer will be a genuine reply. Well, not long ago I heard that Peter was sick; and the report made me fear that something ominous was wrong.

After three miles of walking through dank watercourses, over airy pine ridges, and along old hedged plantation roads I came to the Negro's solitary cabin: and in the sunshine before it sat my old friend. By "old" I do not mean aged, but for long my comrade. He observed me coming, and he tried to smile a welcome; yet he could not rise to greet me. Nothing could have more deeply emphasized the grievousness of his trouble.

"Why, Peter," I said, "I had been hoping you would run an old buck over me this Christmas. What is the meaning of that bandage on your head?"

"I have a little trouble, sir," he said; and his voice was full of suppressed pain. He said no more.

I sat down on the bench beside him in the sun, and for a time I told him of what I had been doing since last we had met. Then at last I asked him about himself.

"The doctor says I've gwine leave you," he said. His tone was one of simple resignation; but on his face was a bleak wistfulness as he gazed off over his home fields. From him was no complaint; he did not even discuss the details of his illness in the manner characteristic of main streets and small towns. He bore and was silent. For him I could do little; of course I did what was possible. But here was a fine specimen of manhood doomed to early death; and he might have been saved by a good doctor if his care had been given in time. Among the most crying needs for the rural South is a Grenfell—or a hundred such—to minister to the Negro physically. To make the imperative nature of this need clear, I may say that in the vast plantation regions not

one Negro mother in a hundred ever receives at childbirth medical attention; and thousands of little babies are reared without ever having in their periods of childhood's ailments any genuine attention such as modern science can give. Many survive, but many perish. Devoted physicians are sorely needed. Many men now in general practice do indeed give the Negro almost boundless help; but the need is still great. I have long wondered why those who give money to Negro education do not specify that some of it is to be devoted to the training of Negroes who shall be medical missionaries to their race; or why all our medical missionaries feel it incumbent to go to Korea and to China and to the other ends of the earth. Great free dispensaries in the South would be of immediate and inestimable assistance to a race which is in dire need of such help, far more in need of it than in need of either lower or higher education. If there is a real "Negro Problem," it seems to be the problem of having him, as a race, given proper medical assistance.

The case of Peter Small, just described, illustrates the Negro's quiet and uncomplaining acceptance of hardships that would make many a soldier quail. Perhaps he does not have those sensitive spirit wings that are so easily crushed by life and its storms, that lift one perilously into ethereal realms; but he has an ascent of spirit sufficient to make him see certain of the fundamental truths of life; to make him steadfast in affliction, courageous in pain, stoical in cruel suffering. These qualities of heart must not be denied the Negro; only by an assured acceptance of them as genuine possessions of his can we approach an understanding of his character.

AGAIN, it has been said that the Negro is slovenly—though, oddly enough, the Negro as pictured in the modern magazine is shown most fashionably tailored, to meet popular fancy in matters sartorial. And I am ready to admit that his acute poverty often lends to him and to the things that are his the appearance of a neglect bordering on abandon. Yet once more come with me to a black hearthstone, and I will show you as bonnie an inglenook as you will find in the glens of Lothian or Argyleshire.

The place in question is called Tranquillity. No stranger abode is to be found on this continent. In the midst of that wild morass known as the Delta of the Santee, where a hundred years ago fortunes were being made in rice, there is now a solitary hillock of white sand. It has upon it two noble live-oaks. There are several cabins there. A half-mile away in the gross delta marsh stands a dark tower—a "slave-tower," wherein in the old days the slaves used to take refuge when a sudden West Indian hurricane came up the coast. But no storm and no mighty freshet which inundates all other parts

of the Delta ever covers with wild waters this inviolate hill of Tranquillity. I often go there to shoot ducks; and I am always welcomed by London and his wife.

Let us say that I arrive after dark. At my call London comes with a lantern; and while we make our way to his cabin he regales me with tales of the abundance of ducks—which, to tell the truth, I can hear hilariously quacking all about me in the flooded fields. In the cabin is London's wife, Lucy, who has supper ready. A cheerful fire of driftwood blazes in the ample hearth; a little lamp, with a chimney clean as crystal, is set on a small immaculate table. The fire and the lamp give sufficient light to show me that the room is immaculate. There is not a cobweb, not a fleck of dust visible. The yellow-pine floor glistens. At the fireplace are shining pans and dark clean pots. Hominy is bubbling thickly. Bacon is frying. Coffee is steaming. London has a neat stack of wood ready to replenish the blaze as long as he and I sit up to talk hunting and the old days. After a time Lucy brings me a broad light cypress board for my lap; and on this she serves my supper—all that a hungry hunter could desire, and served daintily.

After supper we three talk for an hour. Lucy then retires; and London and I rehunt the Delta wastes for the past thirty years. At length he shows me to my room—a little offset from the cabin, which, though bare and small, is as clean as human care can make it. The frame of my bed is of pine boards; the mattress is of Spanish moss; but the sheets are snowy, and so fresh as to seem lavendered. Between these I lose myself in ineffable peace until at four o'clock London calls me for breakfast and the morning shooting.

We return at eleven o'clock; and by broad sunshine the cabin of London is as speckless as it had appeared by night. Besides, on all sides I see neat fences, orderly little garden patches, trim paths. Having, therefore, known this home, and many another like it in character, how can I accept the gross dictum that the Negro is slovenly? When I see a Negro home suffering for want of repairs or for want of all things in the way of neatness that a home should have, I know that "chill penury" here has set its blighting hand. Such a home is more pathetic than it is hopeless; for I feel that it is the result of circumstances rather than of intention, of conditions rather than of character.

IN these days we hear much of this problem and of that; of the industrial problem, of that of immigration, of that of the Negro. But I take it that there is no problem, local or National, which does not resolve itself into a human problem, and therefore an individual problem. "Love thy neighbor as thyself" is a mystically profound and all-powerful command. The so-called trou-

ble between the Negro and the white race is identical with the trouble between any two individuals of any race or age who do not understand each other and do not wish each other well. The hearts of all of us are infallibly human; and by the truth of such a statement all of us are indicted; for, since we are human, we are liable sometimes to be intolerant, selfish, unappreciative of another's position, needs, hopes, fears, de-

sires. The Golden Rule is the almighty solvent for all human ills of the character in question; one touch of its wand, and the shadows of ages flee away.

Clouds and darkness rest upon all phases of life; upon that of the field and the forest, the strident mart, the moiling factory, the mazy and pulsating arteries of transportation. But the movements of men and women in the more active phases of life often give us no

real idea of the inner life—the sanctuaries where dwell the hearts of the race. It is only by the life of the home—or chiefly so—the joys and sorrows, the music and the silences before the family fireside, that we come truly to know any people with the poignance of acute understanding. And I hope that I have come to know something of the real Negro through my visits to the black hearthstone.

PETTICOAT HILL FOR EXAMPLE

BY FRANK A. WAUGH

PRESERVING LOCAL SCENERY

IN western Hampshire County steep hills command no special premium. Even when they have a good stand of timber they are considered valuable chiefly to the lumberman. At the very foot of Petticoat Hill itself stands a thriving sawmill, which obviously could not keep piling up its sawdust cones unless timber cutting were a going business. Yet the sawmill is one of the very clearest reasons for the present status of Petticoat Hill.

For this is not just a common hill with a common stand of second-growth mixed hardwoods on it; this is a State reservation with a bronze tablet set in a stone at the front entrance. The inscription on the tablet reads:

PETTICOAT HILL
GIVEN INTO THE KEEPING OF THE
TRUSTEES OF PUBLIC RESERVATIONS
BY
MARTHA WINSLOW NASH
IN MEMORY OF HER HUSBAND
EDWARD WORTHINGTON NASH
A LOVER OF NATURE
1906

In short, we have here a beautiful woodland park typifying several principles of great importance in the cultural life of this interesting young American race.

MAKING A MEMORIAL OF NATURE

As a memorial what could be finer than this? In fact, do we not have here the very model for all those communities, all those posts of the American Legion, and all other public bodies now seeking the best means to memorialize our friends and comrades who failed to return from the Great War? Town parks and forests have been frequently suggested of late as appropriate memorials. Any one who cares to see how it seems may drive up to Williamsburg, Massachusetts, and satisfy himself fully. A half-day scrambling over Petticoat Hill, walking through the cool forest, resting on the convenient seats, drinking from the big spring, looking out at the inspiring distances, ought to convince anybody that such a memorial is worth while.

THE BIG WHITE OAK ON PETTICOAT HILL

"This is not just a common hill"

generally obliterated, and in place of the ancient story written with blue-stem, bunch-grass and buffalo-grass, with purple astragalus, prairie sage, and upstanding compass-plants, there is inscribed a new story of wheat and corn and alfalfa. No one need regret the

transformation, except that it has been too complete. There ought to be some adequate and legible remnants of the prairies kept for succeeding generations.

The fact is, the common college graduate, mill worker, floor-walker, member of the Legislature, or hotel barber does not appreciate the importance of saving good specimens of local scenery. Each of these representatives of general society does actually love the landscape, and goes fishing, golfing, or picnicking in it whenever possible, but he no more considers the public duty of protecting it than he thinks it his business to look after the State's water supply. That is why a concrete example like Petticoat Hill is so significant.

In Belchertown, at the other end of Hampshire County, is another reservation of local scenery equally worthy of mention. This is a deep, rocky, picturesque glen with heavily wooded slopes above and a courageous little stream below. The name commemorates the youth of the author, James G. Holland, spent in this neighborhood. The land was recently bought by public subscription and is held by the trustees of the Belchertown Historical Society.

Still another example of delightful landscape which enjoys a neighborhood reputation and use is found in Whately Glen, in the neighboring town of Whately. Here a considerable brook comes down from the hills through a gorge of heavily faulted granite. There is a whole chromatic scale of waterfalls from A altissimo down to G below the cow pasture. The big ones roar in the gloomy shadows like lions in the jungle; the little ones flash over the sunny ripples like butterflies on the milkweed blossoms. Here, shut in by the towering hills, shaded by the woods and sung to by the tumbling waterfalls, is one of the finest picnic grounds I have ever seen, and I do not forget Schoenbrunn, the Bois de Boulogne, nor Maxwell's Grove on Sharps Creek in Kansas.

This delightful spot, well known and loved by the citizens of two counties, is nevertheless only partially published. It is still held partly in private ownership. The village of Deerfield has some water rights, but the public has no permanent

PICNIC GROUNDS AND CASCADE AT WHATELY GLEN

"There is a whole chromatic scale of waterfalls from A altissimo to G below the cow pasture"

picnic rights. Something ought to be done about it, and quite possibly something will. The trend of civilization lies that way.

GOVERNMENT AND LANDSCAPE

Since we have begun to use these joyful bits of common scenery to illustrate general principles, we might as well carry our generalizations one step further. The preservation of good landscape is one of the highest functions of human government. The government hasn't generally found it out yet, but that does not alter the fact. The Federal Government of these United States has lately taken to the protection of a few outstanding landscape features in the National Parks, a few others in the National Monuments, and the incidental, unintentional safeguarding of scenery in the National Forests. Some States have State parks and forests; others are waking up to the sound of the alarm clock and are stretching themselves in a sleepy sort of way toward the same goal.

THE MORE LOCAL, THE MORE IMPORTANT

But when this is all done, it is not enough—not nearly enough. Petticoat Hill, Whately Glen, and Holland Glen are not National Parks, they are not even State parks; they are merely indispensable. They are here in Massa-

chusetts, where we live, right in our own neighborhood. We can go to see them two or three times a year if we have sense enough. One could go to them as easily and as often as to the movies, with results possibly as good. They are a part of our daily environment. They help to make Massachusetts beautiful, and Massachusetts is the habitat of some millions of people who need beauty at home.

The general principle here is that local government is the most important—the more local, the more important. The government of our town concerns us more than the affairs of our State, and our State business affects us more seriously than anything they do in Washington; while any one can lately observe that national government is so much more important than world government that national governments will hardly permit the world order to emerge at all. Thus when it comes to that highly consequential function of government, the reservation, protection, and publication of scenery, the most serious concern in the whole programme is that the local community should take care of its own picnic grounds.

This generalization applies without exception or qualification to every community. Has your neighborhood some

exceptionally lovely spot, some lake, some stream, some hilltop outlook, some forest, better than the average and representative of your country at its best? Certainly you will want to keep it, to enjoy it, and to hand it down unimpaired to your grandchildren. Or is your neighborhood, on the contrary, destitute of all these glories? You will then certainly want to keep the best you have, and haply to improve it, so that you may not be ashamed among the neighbors of your State, nor your children unused to the beauties of their native land.

DRAWING A MORAL

Either way, your town requires the best local park which your territory can supply, and the sooner your citizens come to themselves and do the right thing for themselves, the better it will be also for the popular human race, and especially for your immediate successors. It is not necessary to wait for an act of Congress, or even to get a bill through the Legislature. If you and your neighbors know what you want, there are forty ways to get it, and all of them better than getting it through Congress. Petticoat Hill is one example among thousands of what has already been done.

DU PONT

He has helped pack hours into minutes!

AFTER all, the measure is how much he the years he has on earth; civilization's hardest battles struggle with Time... of a man's life accomplishes in and one of civilization's hardest battles struggle with Time... the unending effort to give to each succeeding generation the means of making a fuller use of the winged minutes.

This war with Time is old as Time itself . . . yet the most glorious victories have come in the past century . . . the century that has seen the entrance of the Chemical Engineer into the world's industries. It is he who has helped make your minutes as long as your great-grandfather's hours. It is he who, working miracles with metals, has made possible the wonders of today's time-saving transportation . . . the mile-a-minute locomotive, the cross-country truck, the racing motor and now, the promises of the sky's highways.

Helping to produce telephone, telegraph—and wireless, he has cut the time of communicating with other people to the merest fraction of what it was a century ago. His applications of chemistry to inks, colors and papers, have made possible books, magazines, newspapers, publications that reach millions in the time your great-grandfather took to reach a few scores of people.

His paints, enamels, varnishes have placed beauty beyond Time's destroying hand. His movie films flash the world before you, and his phonograph records immortalize Caruso's voice for your children's children . . . while Jenny Lind's is but a memory to a passing few.

* * *

THE Chemical Engineer is a pioneer in industry, for into the realm of manufacturing he has brought not only abundance of materials that speed the world's production, but processes that are new, that are less costly, that are less wasteful. To him, you and all this generation of men owe the radical advances in life's comfort that have come in the past hundred years.

It is the du Pont Company's pride that since its founding in 1802, it has been a large employer of Chemical Engineers . . . and has been able to make very considerable contributions to the growth and advancement of applied chemistry that has given America its deserved supremacy in industrial achievement.

This is one of a series of advertisements published that the public may have a clearer understanding of E. I. du Pont de Nemours & Co. and its products

E. I. DU PONT DE NEMOURS & COMPANY, Inc., Wilmington, Del.

TRADE  MARK

FINANCIAL DEPARTMENT

The Financial Department is prepared to furnish information regarding standard investment securities, but cannot undertake to *advise* the purchase of any specific security. It will give to inquirers facts of record or information resulting from expert investigation, and a nominal charge of one dollar per inquiry will be made for this special service. All letters of inquiry should be addressed to THE OUTLOOK FINANCIAL DEPARTMENT, 381 Fourth Avenue, New York.

"SMITH'S FIRST INVESTMENT"

IN the belief that many readers of The Outlook are not familiar with the method of buying and selling stocks on the New York Stock Exchange, we shall try to explain to them how such transactions are carried out. The idea was suggested to us by a pamphlet, in the form of a little play, issued by the Committee on Library, New York Stock Exchange, from whom copies of the pamphlet may be obtained upon application. The pamphlet is entitled "Smith's First Investment," with the sub-title "A Dramatization of a Typical Investment Transaction Made Through the New York Stock Exchange." It

is an extremely interesting and informative piece of work, and we take the liberty of presenting the gist of it here.

The playlet opens with Smith, a man with money to invest, entering the Denver branch office of Wilkins & Co., members of the New York Stock Exchange. A "quotation board" is on the wall at the rear of the office, and a boy is posting quotations on it as they are read off to him by another boy at the stock ticker, which lists every transaction on the Exchange a few moments after it is made.

Smith has never bought any stock in the office before. He

STRAUS BUILDING - CHICAGO

STRAUS BUILDING - NEW YORK

Trustworthy Bonds for Every Investor

"STRAUS BONDS are absolutely trustworthy," writes one of our clients, "and I do not know what higher praise I can give to an investment than that. When I buy a bond of you, I know I shall never have to worry over the safety of my funds."

This simple statement of fact is typical of thousands of letters we get from our clients every year, all telling the same story—safety, satisfaction, and freedom from worry and care, through investment in Straus bonds.

Every investor should post himself on these sound first mortgage bonds, which are available in maturities from two to twenty years and in denominations of \$1,000, \$500 and \$100. Write today for descriptive literature, and specify

is introduced to the manager, and explains that he has \$10,000 he wants to invest in a good stock. He presents a letter of introduction, opens an account with the firm much as one would open an account with a bank, and is told that when he gives an order a deposit of one-half the amount required is necessary, the balance to be paid when the stock certificates are delivered to him. Upon inquiry, Smith learns that the usual commission for executing stock orders averages about 1/6 of 1 per cent—that is, \$15 for the purchase of 100 shares of stock at \$100 a share, involving \$10,000.

Smith is satisfied thus far, and asks the manager to buy him some stock which he considers good. The manager quickly informs him, however, that no good firm will take the responsibility of such an order; they are glad to give an opinion on securities, but cannot accept "discretionary orders." Smith thereupon asks his opinion of a certain stock, and the manager tells him he considers it a good investment. He explains to Smith, however, that an order for this stock does not mean that it is being bought from Wilkins & Co., but only through them. The brokerage firm is merely an agent. He explains further to Smith that a great advantage of buying stocks listed on the New York Stock Exchange is the fact that they can be bought and sold on a very few minutes' notice, which is not true of many unlisted securities. Again, listed securities make better collateral and it is easier to borrow money on them. Lastly, the investor is protected, because the Exchange severely restricts the way business is done there.

The manager and Smith then consult the ticker, and find that the stock they have in mind has just sold at 95½. Smith thinks he does not want to pay more than that for it, and finds that he can enter an order for it at that price and it will be bought for him at 95½ or less or not at all. He therefore writes on the order pad, "Buy 100 Blank Common at 95½."

The manager takes the slip to the window marked "Orders" and hands it in. A clerk takes the slip, reads it, and hands it to the telegrapher seated at an adjoining desk before a telegraph instrument. The telegrapher reads the slip as he transmits the message over the firm's private wire to New York, "Buy 100 Blank Common at 95½."

In the wire room of Wilkins & Co.'s New York office are several telegraphers seated at desks labeled "Denver," "Boston," etc. The instrument on the Denver desk begins to click and the order comes in, "Buy 100 Blank Common at 95½." When he has written out the message, the telegrapher hands the slip to the order clerk. The order clerk takes down the receiver of his telephone, which is connected with another telephone on the ground floor of the New York Stock Exchange. "Hello! Hello!" he says. "Buy 100 Blank Common at 95½. Got it?" He replaces the receiver.

At the other end of the phone is another clerk. He too writes out the

En route to American sidewalks

AT every stage, from living cattle to finished footwear, good banking smooths the commercial pathway for the leather industry. Whether hides and skins are shipped from the American or Canadian West, Latin America, the Orient or elsewhere, funds and documents are handled accurately, safely and swiftly. The banker also conducts investigations and performs other special services at moderate cost.

Boston, the greatest leather market, is a clearing house for domestic and foreign hides. Tanneries have operated here since Colonial days. Leather manufacture in this country employs hundreds of thousands.

Sturdy Massachusetts shoes are preferred by millions, East, West and abroad. Other New England-made leather goods sell in markets nearly as extensive. In serving all this national and international commerce, the world-wide organization of the National Shawmut Bank is decidedly useful and efficient.

It is always a pleasure to welcome new clients who desire to avail themselves of our facilities and experience. Likewise, it is pleasing to serve other banks who have business in this section, and wish to handle it via the most direct route—the bank that is closest to the heart of New England industry.

THE NATIONAL SHAWMUT BANK
of BOSTON

FROM THE SOIL

This country's prosperity, with all its industrial greatness, springs essentially from the soil and is largely dependent on the efforts of those who sow and harvest the crops that contribute to the basic wealth of the nation.

Situated at the heart of a vast farming region, The Continental and Commercial Banks, through many years of close contact with agricultural interests, are keenly alive to the special banking requirements of farmers and endeavor to meet these in a manner fully justified by the great importance to the country of those who produce and market its crops.

order on a slip of paper, presses a button beside him, which flashes a number on the annunciator board at one end of the room, this number belonging to Mr. Wilkins, the floor member of the firm. He sees his number on the board, hurries to the telephone, and gets the slip with the order on it. He then hurries back to the trading floor, which is covered with brokers and pages; there is a loud murmur of voices and many people are hurrying to and fro.

Mr. Wilkins approaches the "post" where Blank stock is traded in and inquires the market on Blank Common. A specialist seated at the "post" replies, "94 $\frac{7}{8}$ bid—offered at 95 $\frac{1}{8}$." Mr. Wilkins then shouts to the crowd assembled there, "I'll give 95 for a hundred Blank." Another broker answers, "I'll sell a hundred at 95 $\frac{1}{8}$." Again Mr. Wilkins tries to buy it at 95, in order to save the extra eighth for his customer, but the other broker is firm. A third broker appears on the scene at just that moment and offers a hundred at 95. "Take it," shouts Wilkins, eagerly. The two brokers confirm the deal, and Wilkins reports to his telephone clerk. The report of the purchase thereupon starts traveling back towards Denver over the same route the order to buy had taken, and in a very few minutes—less than ten probably—Smith is handed a confirmation slip by the manager announcing that Wilkins & Co. have purchased 100 shares of Blank Common for him at \$95 a share. Smith gives Wilkins & Co. his check for one-half the purchase price, and inquires when he may expect to receive his stock certificate.

"Not for several days," says the manager. "You see, this transaction must go through the clearing-house first, and Wilkins & Co. will get the certificate tomorrow. But, as you wish to take this stock up and hold it as an investment, it must first be transferred into your name at the transfer office of the Blank Corporation, in New York, so that the dividends will be sent to you. Before the certificate is transferred into your name you must pay us the remaining sum you owe on it. When our New York office gets the certificate made out in your name, it will send it by registered mail to us. When we receive it, we will notify you, and you can take it away."

"But, in the meantime," Smith asks, "how about a receipt?"

He has the confirmation, the manager tells him, but of course he can have a formal receipt too.

Meanwhile the boy at the ticker in the Denver office reports the sale of 100 Blank Common at 95 and the board boy puts the quotation on the board, where the customers seated about the room can readily see it.

"Probably the 100 shares you bought," the manager says to Smith.

"How are the reports of sales and purchases put on the ticker tape?" Smith inquires.

"When a sale is made on the floor of the Exchange," the manager explains, "a

The Atlantic Trust Investment Plan

BANK SAFETY FOR INVESTORS

The Atlantic Trust Investment Plan is the partial payment or instalment plan of buying bonds, with this important addition:

The entire resources of this bank—the same resources that are back of savings and checking accounts—are back of your investment account.

The most important feature of the Atlantic Trust Investment Plan is **BANK SAFETY**.

With a first payment as low as \$50 and monthly payments of \$20, you can buy the same bonds we buy for the investment of the bank's funds.

reporter writes it down, checks it with the brokers making it, and turns it over to one of four telegraph stations on the floor. The operator there telegraphs it to an office in an upper story of the Exchange building, where another set of operators put it on the ticker. From there it goes out, and is printed immediately on ticker machines all over the country."

Smith asks if any one can get a ticker machine, and learns that the Stock Exchange is very strict about them and will allow no one to have one of their tickers unless the results of careful inquiries are entirely satisfactory. Any firm suspected of illegitimate transactions is liable to have the ticker removed from its office, for all tickers are the property of the Exchange.

So it happened that Smith made his first investment and discovered how it all was done. If he had wished to sell 100 shares of Blank Common, the procedure would have been almost exactly the same, except that he would have had to deliver his stock certificates for this number of shares when he placed his order to sell. And he could have instructed his broker not to sell for less than 95%, or "at the market," which means the best price the broker can get for it at the time of sale.

Buying and selling stock through the New York Stock Exchange is, so far as the investor is concerned, one of the simplest things imaginable. And the service rendered is probably speedier and more efficient than is the case with any other transaction in the world of business.

LILACS

BY HARRY LEE

THE little seamstress
Paused before a stall
Where lilacs were—
And suddenly
The street became
A leafy lane to her,
All rainy winds
And twitterings,
And flitting amber light,
And wings—

The room rent paid,
One need not think
Of anything
But food and drink—
And one can work
With such a will—
With misty lilacs
On the sill—

The little seamstress
Paused before a stall
Where lilacs were—
She came
In threadbare gray, but oh—
She went
In lavender—

Important to Subscribers

When you notify The Outlook of a change in your address, both the old and the new address should be given. Kindly write, if possible, two weeks before the change is to take effect.

An Unusual Service for Outlook Readers

You are frequently in need of a household helper, companion, nurse, governess, teacher, or business or professional assistant. Or perhaps you are in search of such a position yourself.

In either case, an Outlook "Want Ad" will undoubtedly solve the problem. Here is a typical extract from a letter just received—"I had not anticipated that my ad would prove so alluring. I received twenty-four replies and they came from thirteen different States. It has given me a great respect for the wide circulation of The Outlook."

Try a "Want Ad."

The rate is only Ten Cents a Word.

His father New York business man, might live in the same home with him if accommodations a suitable, but this is not required. Surroundings must be A1. Appointment for interview may be arranged by addressing 1,904, Outlook.

BY THE WAY

WHAT mental image is called up by the words "an Englishwoman"? Probably that of a fair-haired, blue-eyed, slender woman above the ordinary height. And with this image in mind the author of "Crusading in the West Indies" no doubt received a shock when he asked an old Negress in San Juan if she was a Porto Rican and received the proud answer, "I am an Englishwoman!" "I never," he says, "should have suspected it from her color. It appeared that she was born in one of the neighboring English islands and was a British subject—therefore 'an Englishwoman,' not bad logic!"

President Southard, of the International Association of Women Preachers, in a recent address said that of all the churches the Friends (Quakers) have had the largest proportion of preaching women. The Disciples of Christ and the Christian Church have also always given opportunity for women to preach. The Salvation Army recognized sex equality from the beginning. "The liberal churches, Unitarian and Universalist, ordain women. 'The Battle Hymn of the Republic' was written by a Unitarian minister, Julia Ward Howe."

Wealthy Uncle (as reported by the "Purple Cow" of Williams)—"You are extravagant, sir. These cigars are a lot better than I smoked at your age."

Collegiate Nephew (coolly)—"They're a lot better than you smoke now."

"Finance and mechanics have long been considered non-feminine spheres," a writer in the "New Republic" says, "and so it is encouraging to discover that in New York City there are 399 women bankers and money-lenders, 940 real estate agents, 1,699 manufacturers, and 1,051 managers. It is equally gratifying to discover 137 women engravers, 22 electricians, 12 building contractors, 24 architects, and 10 electrical engineers. The list even includes seven inventors, a mechanical engineer, and 324 dentists—all tasks requiring mechanical skill."

Visiting Aunt (as reported by "Punch")—"You've been a naughty little girl to-day, Pamela."

Pamela—"Well, you shouldn't come on a Monday; that's my bad day."

Commenting on Mr. Hutchinson's novel "If Winter Comes," as the greatest success in fiction of the past year, Mr. C. K. Shorter, editor of the London "Sphere," raises the question whether the book's psychology is altogether sound. "Men's understanding of women is a thing upon which they continually flatter themselves," he says, "but where they constantly come to grief. Novelists and poets have not been the most fortunate classes so far as their married life is concerned."

"Dante's Beatrice and Milton's Eve Were not drawn from their spouses, you'll believe,

says Byron, and an analysis of the married life of the majority of poets and novelists who have prided themselves

upon their knowledge of womankind has shown that they have almost invariably selected the wrong partners in life. But the main thing is that Mr. Hutchinson has succeeded in writing another novel which will command a wide public and which will prove provocative of discussion."

The question has been raised as to where O. Henry, the famous short-story writer, got the O. in his *nom de plume*. A writer in the New York "Times" quotes "the only interview ever given to a newspaper" by William Sydney Porter, as O. Henry was known in real life, as conclusive on the subject:

"It was during these New Orleans days that I adopted my pen name. I said to a friend: 'I am going to send out some stuff. I don't know if it amounts to much, so I want to get a literary alias. Help me pick out a good one.' He suggested that we get a newspaper and pick a name from the first list of notables that we found in it. In the society columns we found the account of a fashionable ball. 'Here we have our notables,' said he. We looked down the list and my eye lighted on the name Henry. 'That'll do for a last name,' said I. 'Now for a first name. I want something short. None of your three-syllable names for me.' 'Why don't you use a plain initial, then?' asked my friend. 'Good,' said I; 'O is about the easiest letter written, and O it is.'"

Basketball Coach (as reported by the "Yale Record")—"Here you! Don't do that! Use your head!"

Little Green—"Oh, is that allowed?"

A lover of horses sends these items about famous chargers:

Epitaph on the grave of Copenhagen, the charger ridden by the Duke of Wellington the entire day of the battle of Waterloo:

Born 1808. Died 1836.
God's humble servant, tho of meaner clay,
Should share the glory of that glorious day.

The Grenadier Guards had a snuff-box made of one of the hoofs of Napoleon's horse Marengo. The lid was inscribed:

Hoof of Marengo, barb-charger of Napoleon. Ridden by him at Marengo, Austerlitz, Jena, Wagram, in the Russian Campaign and at Waterloo.

General Lee's horse, Traveller, lived two years after his master's death, lovingly cared for.

General Custer's horse, Comanche, alone of horses and men, survived the Battle of Little Big Horn. He lived to be almost thirty years old—was never ridden again after Custer's last stand. His name was entered on the retired list of the U. S. Army and for nearly twenty years drew a pension.

Apropos of faithful horses, it is announced that Mrs. Warren G. Harding has presented a check for \$100 to "Clover," a fifty-one-year-old horse. "I hope Clover will long continue to be the oldest horse in the world," she said in presenting the gift.

Travel with Comfort and Economy

You will not only enjoy the water trip but will save money by traveling on D & C Steamers which make daily trips between Detroit and Buffalo; Detroit and Cleveland on Eastern Time.

of the Year*

THIS FREEDOM

By

A. S. M. HUTCHINSON

Author of

IF WINTER COMES

A story of married life which will provoke
widespread discussion. Can a married
woman have a business career and still do
her duty by her husband and her children?
That is the theme of this absorbing, vital
novel, which will undoubtedly be the best
seller of the year. Wherever people gather,
there will be talk of THIS FREEDOM—and
you will want to have read it.

The Day's Work on the New York Central

FROM midnight to midnight the New York Central Lines haul 100,000,000 ton-miles of freight.

A ton-mile, the measure of transportation, is one ton moved one mile. A hundred million ton-miles are equivalent to moving a ton a distance greater than from the earth to the sun; or of moving 4,000 tons around the world.

In the same twenty-four hours the passenger trains record 10,000,000 passenger-miles, the equivalent of carrying more than 10,000 passengers from Chicago to New York.

The day's work of the New York Central Lines is about one-tenth of the transportation service of the railroads of the United States, and is greater than the service rendered by all the railroads of England and France combined.

NEW YORK CENTRAL AND SUBSIDIARY LINES

CONTRIBUTORS' GALLERY

SAMUEL FLAGG BEMIS is Professor of History at Whitman College, in Walla Walla, Washington. With his article Mr. Bemis sent us copies of the "News Bulletin" published by the Foreign Policy Association, containing arguments for the return of all alien property and also regarding the recognition of Russia. He refers to these bulletins in his discussion.

A FEW years ago there appeared in The Outlook a group of poems from the Chinese by Witter Bynner and Dr. Kiang—the first of these translations to be printed in any magazine in America. Since that time nearly two hundred of them have been published in various magazines in this country and in England. Mr. Bynner has again submitted another group which we present in this issue. Mr. Bynner is a playwright, poet, and lecturer on poetry and kindred subjects. He was graduated from Harvard University in 1902, and was for four years assistant editor of "McClure's Magazine" and literary editor of McClure, Phillips & Co. From 1907 to 1915 he was advisory editor with Small, Maynard & Co.

ELON JESSUP, whose timely articles on various outdoor activities have been of invaluable assistance to the more or less amateur sportsman, furnishes the readers of The Outlook with some practical instructions in mountain climbing. He is the associate editor of "Outing."

FRANCIS ROGERS is the author of the article entitled "A Glimpse of England." He is a graduate of Harvard and a very finished musician. He has been instructor of music at Yale University, and during the war did extensive Y. M. C. A. work in France. His special correspondence from Europe has interested and informed readers of The Outlook from time to time.

SPECIAL correspondence from Europe comes to us from the pens of two other men well able to give clear and authoritative information. Major-General Sir George Aston has been recently contributing articles on British affairs. Mr. Elbert F. Baldwin is a member of our own editorial staff who is representing The Outlook abroad.

WILLIAM P. HELM, JR., has made himself known to Outlook readers by his Washington correspondence.

FREDERICK M. DAVENPORT, of the New York Senate, writes on a subject which is of never-failing interest to the American public. The article is but one indication that Senator Davenport's skill in dealing with public questions has its source in a very broad human interest.

The Outlook

AUGUST 30, 1922

GARVEYISM

IN the present circumstances of "Rt. Hon." Marcus Garvey—the "Negro Moses" and "Provincial President of the Republic of Africa"—Mr. O'Neill might find material for a play as gripping, almost, as "The Emperor Jones."

Uptown, at Liberty Hall in Harlem, New York City, Garvey dons robes of green, crimson, and black to preside over his third "world congress" of Negroes, grants titles of nobility, and divides up Africa into "dukedom." Downtown, meanwhile, officials of the United States Department of Justice are preparing for his trial, early this fall, on charges growing out of misfortunes that have overtaken his steamship corporation, the Black Star Line, whereby the \$600,000 invested by hard-working Negroes vanished into thin air.

In his schemes his Black Star Line was "vital." For years, now, he has told his followers that only by supporting the "merchant marine" and linking together the fragments of "scattered Ethiopia" could they hope to liberate Africa, unite it, civilize it, develop it, arm it, and make it a black Zion of refuge and at the same time a defender of black men everywhere. Invariably his speeches, as well as the state documents issued through his newspaper, "The Negro World," led up to "And now a word about the Black Star Line; we must have ships—more and larger ships!"

Dr. W. E. B. Du Bois has gone on record as declaring his belief in the man's honesty, though he long ago foretold the consequence of slipshod business methods. Judge Panken, lecturing Garvey in the Seventh District Court, said, "It seems to me that you have been preying upon the gullibility of your own people, having kept no proper accounts of the money received for investment," but added, "There is a form of paranoia which manifests itself in believing one's self a great man." The Friends of Negro Freedom, however, are less charitable. Their poster, headed "Marcus Garvey Must Go!!!" invites "men and women, white and colored, foreign and native" to Shuffle Inn, where anti-Garveyism challenges Marcus (and the police) every Sunday afternoon.

According to Garvey's figures, Garveyism the world over has 4,500,000 adherents. According to the National Association for the Advancement of Colored People, the Belgian Consul has been inquiring about Garvey apropos of unrest in certain Belgian colonies. This has

led the Association to call up the French Consulate, who, according to report, attributed unrest in certain French colonies to the same cause. According to Garvey's own published statement, his newspaper has been excluded from certain British colonies. A page of that paper is printed in Spanish. To reach Spanish-speaking America? Perhaps only to reach the now fairly numerous Spanish-speaking Negroes of Harlem, where a branch of the New York Public Library maintains a Spanish department. In all that relates to Garvey and Garveyism one expects exaggeration. Not long ago an anti-Garveyite statistician reviewed the Provisional President's figures in the light of his finances and concluded that, at most, his followers numbered 90,000.

PRIDE IN RACE

IT would be a mistake to conclude that Garveyism is the product purely of the bravado which expresses itself in Garvey's uniforms and in the gorgeous feathers that adorn his hat as he rides in glory, or of the equally gorgeous pretentiousness of his programme. Whatever success Garveyism has had has been made possible because there is in it an appeal to a sound and wholesome quality, though the appeal is perverted and the quality exaggerated. Garvey's whole appeal is addressed to the instinct of self-reliance. With all its bombast and absurdity and mad quixotism, it is an appeal to race pride. The injury that it has done to the more credulous among the Negroes and the mental torment that it has inflicted upon the saner element among the Negroes cannot be ascribed to the fact that it has been an appeal to race pride, but that it has been an appeal to false pride of race. Booker Washington also appealed to race pride, but it was the pride that set men, not to chasing rainbows, but to self-respecting work and to service of the commonwealth.

It is perhaps significant that Garvey, who proclaims himself the Provisional President of the Republic of Africa, is not an American but a West Indian, and that the notion of "Africa for the Africans" was not even originally his own, but was borrowed in London from Dusi Mohammed Ali, half Negro and half Egyptian. This sort of thing is not likely to have any permanent influence on Americans, white or black.

While Garveyism is running its spectacular and tragic course, the steady

progress of the Negro in America is following the lines marked out by Booker Washington, one of the great Americans of his time, whose pride in his race existed side by side with a humility that was one of the elements of his greatness

SECRETARY HUGHES ON THE NEWBERRY CASE

THE occasion for the vigorous letter recently written by Secretary Hughes in which he declares that Senator Newberry was wrongly and most unjustly convicted was an inquiry from a single correspondent; but the timeliness and value of the letter lie in the fact that the charges against Senator Newberry, which have been thrown out by the highest court in the country and by the action of the Senate itself, are being used in the political campaign in Michigan against the candidacy for renomination by the Republican primary of Senator Townsend, who has ably supported and defended his colleague, Senator Newberry.

It is true, as Mr. Hughes intimates, that there still remains some misunderstanding as to the nature of the charges against Senator Newberry and the result of the thorough investigation by the Senate. Mr. Hughes sums up by saying, in his usual vigorous and clear manner: "The conviction of Senator Newberry was obtained under a statute held by the majority of the Supreme Court to be invalid. It rested upon a ground which did not involve any finding by the jury of moral turpitude, and was effected only by a most serious misconstruction of the statute which exposed him to conviction regardless of any moral offense upon his part and no matter how high-minded he might have been in his conduct in the campaign."

When the facts of the case showed that no legal offense had been committed and that the so-called conviction was really no conviction because it was for a supposed offense not forbidden by law, opponents of Senator Newberry shifted their ground and tried to arouse prejudice and public feeling against Senator Newberry by asserting that the amount of money spent by his friends to secure his renomination was excessive and scandalous. Secretary Hughes points out that it was practically impossible for any candidate to avoid violating the statute if it were construed as the prosecution claimed it should be, for on that basis it would forbid the expenditure by a candidate in a primary of more than

\$3,750—a ridiculous sum when one considers that the very purpose of a primary is to allow the party voters to become informed as to the merits of the different candidates and that this must be done very largely through printed matter and addresses. It has been said that the campaign of Mr. Pinchot for the primary nomination as Governor in Pennsylvania cost over \$125,000, yet every one knows that the campaign was not one of mercenary influence but of public information and of getting the facts and arguments before the voters. In this Michigan campaign, moreover, Senator Newberry's opponent, Mr. Ford, spent enormous sums in what was in effect political publicity, although it was in the guise of commercial advertising.

Senator Newberry was convicted under a law which was not a law as the case proved, and not for any alleged act of corruption, but only on the charge of expending more money than the statute allowed. We repeat what we pointed out when the case was first under discussion, that "to set an arbitrary limit for the expenditure of money for elections is to create a crime where no moral wrong is necessarily involved, and it was a relief to many reasonable students of public affairs to find that this law was based on an arbitrary distinction proved on another ground to be unconstitutional."

PRESIDENT HARDING ON THE LABOR CRISIS: COAL

THERE has been some disposition to criticise President Harding's address to Congress relating to the present crisis in the railway and coal strikes. It is said that he is trying to shift the burden of responsibility from his own shoulders to Congress without definitely telling Congress how to deal with the actual existing crisis; but it is easier to criticise the President for not doing something or proposing something than to describe just what he should do or propose. Immediate and effective action would probably lie in the direction of taking over the mines and the railways, or of enforcing compulsory arbitration, and either course would encounter formidable opposition. When, however, the President declares, as he does in his Message, that the people of the United States are at the mercy of the United Mine Workers, and neither exercises the powers he now has nor asks for new powers to assert the authority of all the people over that part of the people that has them at its mercy, it is not strange that there should be disappointment at the apparent lack of leadership.

The President does make four definite requests from Congress, but none of these requests applies directly to immediate settlement of the strikes. The

request which has met with the most opposition in Congress and seems least likely to be carried out (namely, the proposal for the establishment of a Governmental coal agency which should have power to buy, sell, and distribute all coal that is subject to inter-State shipment) aims to guard the public interest and to prevent profiteering, suffering, and loss if the strikes continue or after they end if the shortage of coal is still a public menace. It does relate to the present crisis, but it does not provide a way for settling the difficulty.

The request for a law which would establish a National coal commission to investigate the coal industry—mining, carrying, distributing, selling, and profits—is admirable, and seems to meet with acceptance in Congress as well as with the public. It would take up and report to Congress such questions as the best way to deal with the over-production and over-mining of the soft-coal mines, with the desire of miners generally for a working year of, say, not less than 280 days, problems of storage and seasons, and how to deal in future with disagreements as to wages and contracts. But this proposal suggests a remedy not for this but for future crises.

PRESIDENT HARDING ON THE LABOR CRISIS: RAILWAYS

ON the railway situation the President's chief recommendation is to do what is popularly called "putting teeth" into the law behind the Railroad Labor Board. The President points out that the Board as it stands now cannot impose penalties nor enforce its decisions, nor require compulsory arbitration. He holds that its decisions must be made enforceable and effective against employers and workers equally. He does not answer the question which every one at once asks, namely, How does he propose that the Board should enforce such powers? Probably he would answer that the case would be analogous to that of the Inter-State Commerce Commission, which has very definite powers; that the orders of the Court could be enforced against the railways precisely as those of the Inter-State Commerce Commission are enforced; and that, as to compelling the workmen to obey the mandates of the Board, the recent decision of the Supreme Court, which would render the unions liable financially through their treasuries, will be of great assistance.

The last specific recommendation of the President does not at first sight seem to bear on the labor question; but it most emphatically does so, for it proposes to allow the Federal Court jurisdiction in criminal cases within States where violence is done to aliens. The immediate occasion for this is of course

the Herrin massacre and the lawless acts of railway employees in holding passengers under uncomfortable and even dangerous conditions on deserted trains. The practical argument for such a measure has often been put before the country, but Congress has never acted. It is certainly an embarrassing situation when such an incident occurs as that which happened years ago in New Orleans, where Italian citizens were lynched; their home Government naturally applied to the United States Government for redress, and our Government was obliged to reply that it had no power either to prevent such a lynching in advance or to punish the criminals. A number of such instances might be quoted, and it seems certain that our dual form of government acts unjustly in this matter. The President did not hesitate to speak of "the mockery of local inquiry and the failure of justice in Illinois," and urged that in the future the Federal Government should have power to "punish barbarity and butchery at Herrin or elsewhere, no matter in whose name or for what purpose the insufferable outrage is committed."

There were energy and purpose in President Harding's pledge in this address to use all the power of the Government to maintain transportation and sustain the right of men to work. He did not hesitate to point out abuses of labor organizations and unfairness of organizations of employers.

THE LABOR CRISIS AS IT IS

BUT meanwhile, up to August 22, there has been no positive advance in the settlement of the railway and coal quarrels.

Under the Cleveland agreement, certain soft-coal operators have pledged themselves to open their mines and some mining of soft coal has been done. The hard-coal strike remains unsettled; day after day we hear of new conferences, but only of hopes of settlement; one such conference is going on as we write, and may have positive results before this is read; one chief difficulty is the insistence by the miners that agreements now and in the future must be reached by conferences, and not through arbitration.

The seniority question, which we have already discussed at some length, remains the difficult point in the railway trouble; the Eastern roads are uncompromising on this point; the Western roads show some disposition to compromise.

THE HERRIN MASSACRE

THE feeling of horror and the demand for action and for the legal punishment for those who perpetrated the slaughter at Herrin grows rather than diminishes as time goes on. One corre-

spondent of a New York paper asks why no adequate measures have been taken and intimates that it is because the local officials have been intimidated by the "Red element." It is true that the local authorities have shown little disposition to deal with the matter bravely and thoroughly. We are glad to note now that a special Grand Jury is to be impaneled to consider the case.

Other indications show that Illinois outside of Herrin is seriously disturbed and active in the matter. One despatch from Chicago states that a private fund of from \$25,000 to \$100,000 is to be raised to enable the Attorney-General to extend his investigations and press prosecution. The Illinois Chamber of Commerce is vigorously pushing this plan, and its president has received a letter from President Harding in which he expresses his gratification of this evidence that there is "a conscience in Illinois which will not tolerate such a disgraceful thing."

Under the present limitations of law and Constitution the Federal Government has no power to move, the sole authority lying with the State authorities because the crime was committed within its limits. We have referred elsewhere to President Harding's request to Congress to remedy this state of things.

ARE THE RAILWAYS SAFE?

RAILWAY employees engaged directly in the transportation of passengers and freight claim that cars and locomotives during the period of the shopmen's strike have fallen into such a state of neglect and disrepair as to render many

of them unfit for use and, in some instances, unsafe for operation.

On the basis of this and other professed fears, transportation employees here and there have temporarily abandoned their duties. An extreme instance was the abandonment of transcontinental passenger trains on the Pacific coast, to which we referred last week. Deserted by the crews, the passengers, including the aged and infirm, were left

for several days and nights to the mercies of the desert in midsummer.

In a letter to the President the Chairman of the Inter-State Commerce Commission pointed out that the Commission is charged with the enforcement of laws governing the safety of rolling stock; and the President, in a reply which received general commendation, urged that there be no modification of vigilance in enforcing these safeguards thrown around the traveling public.

The man or woman who takes passage on a train is entitled to every assurance of safety that human ingenuity can devise. It is as much the railways' duty to safeguard passengers as it is to carry them to their destination. A carrier is required by law to keep its equipment in safe and workable condition at all times. This prime requirement of every-day operation is enhanced during periods of industrial upheaval. Safeguards should be increased, not diminished.

The present condition of rolling stock, whatever it may be, is not wholly the result of the strike of the Federated Shop Crafts, which began on July 1. What were the railways doing to bring their equipment to required standards of safety prior to the shopmen's strike? Have cars and locomotives one hundred per cent safe on June 30 deteriorated so rapidly as to become unfit for use two months later?

On the whole, we think not. Some of the claims of the employees may be justified, but, all in all, their recent sound-

AN INFORMAL CONFERENCE ON THE COAL STRIKE

John L. Lewis, President of the United Mine Workers, is shown at the right talking to two newspaper men; James J. Davis, Secretary of Labor, is at the left, with hand extended, engaged in earnest conversation with a larger group of newspaper reporters

ing of alarms savors somewhat of propaganda. It would be but natural for the strikers to court public support in this manner in their desire to end the strike. It seems, however, to have been overdone. The railways still load almost capacity freight, except for coal.

But where in the scale of requirements did rolling stock stand when the shopmen's strike was called?

All told, there are 2,258,000 cars in the ownership of Class I railways. Of that total more than fifteen per cent, or upwards of 342,000, were in bad order July 15. The figure is about the same as that of July 1. These railways operate 64,000 locomotives. More than 15,000 were in bad order July 15. One locomotive out of every five owned by the chief carriers of the country was laid up for heavy repairs. One out of every twenty was laid up for light repairs. The figures are those of the railways themselves.

That was the situation June 30, in substance, for two weeks made little change in the numbers. It has been the average situation for two years past, the carriers' reports reveal. The situation was worst in July, 1921, and had been growing progressively better till the strike was called. The railways were not wholly to blame for this sad state of affairs. They have not even yet fully emerged from the demoralization of Federal control. The business depression also depressed equipment repairing. But with the coming of the business revival the railways had started to put their house in order—a task interrupted by the strike.

The interruption should be but a temporary one. The figures are far higher than they should be. When working conditions become normal again, as they surely will, it should be the carriers' first duty to take their broken equipment out of the shop and put it, in safe running order, on the rails.

A BAD TURK

ENVER PASHA was the last to die a violent death of the triumvirate that misruled Turkey, and that ordered or allowed the slaughter and starvation of hundreds of thousands of Armenians and affronted the sentiment of the world. Talaat, who brutally defended the massacres, was assassinated by an Armenian; Djemal was slain a few weeks ago; now Enver has been killed in Bokhara by the Bolsheviks, whom he first supported and then betrayed. He was the strongest of the trio intellectually, but his violent temper and his insatiable personal ambition pushed him always into situations where revenge and hostility encompassed him.

Enver had the evil pre-eminence of being the man who forced Turkey into the arms of Germany. He even made a

secret alliance with Germany months before his purpose was known in his own country and took measures hostile to the Allies while Turkey was nominally neutral. His military activities (apart from the defense of the Dardanelles, which was largely planned and carried out by German experts) were vacillating and ineffective. Since the war he had been a wanderer and a schemer; he plotted to become monarch of the Kurds, nominally aided the Soviets in the Caucasus region, and finally took arms against them.

There was a time when Europe thought it saw in Enver Pasha the leader of a rejuvenated and reformed Turkey. But the Young Turks' régime was as oppressive and as far removed from ideas of self-government as the Sultanate it overthrew. It ruled by force and ignored what laws were supposed to exist. After the close of the war, Enver was outlawed at Constantinople, was declared the author and instigator of many crimes, and condemned to death, if caught.

Enver's career was devoid of patriotism; principles he had none. He fought for his own hand, and died the death of a turbulent disturber of the peace.

"THE MOTHER OF CONTINENTS"

AN article in "Asia" by the distinguished scientist Dr. Henry F. Osborn, who is at the head of the American Museum of Natural History, has as its title "The Mother of Continents." It relates to recent discoveries by an expedition under the leadership of Mr. Roy Chapman Andrews for the Museum in Mongolia. There in distant and barren

tracts have been found large deposits of prehistoric remains.

The interest and importance of this find is not in the fossilized remains themselves, but in the deduction drawn from the quarter of the globe where they have been uncovered. One of the great problems of science has been that of the course and movement of mammalian life over the globe. The two great beds of prehistoric deposits heretofore known are widely separated—one in Europe, the other in our Rocky Mountains. Now Dr. Osborn has long argued *a priori* that the progress of the extinct, big mammalian life could not have been from one of these regions to the other, for if so there would be evidence of a spread of that life from the Rockies east and from Europe west. The only other logical alternative would be that the original region of full development before dispersal must have existed at some point on the other side of the globe, west of the Rocky Mountain center and east of that in Europe. That would be somewhere in Asia. It was partly to seek such a center that this expedition was sent out.

The discovery lately made precisely answers the requirement of Dr. Osborn's hypothesis, and verifies the theory that from Mongolia the emigration of the great mammals started east and west, reached the centers already known, and thereabouts died out by dispersal. Dr. Osborn comments:

This discovery gives the answer to one of the four great questions which the expedition sought to solve: namely, whether ancient Asia is the mother of the life of Europe to the far west, of North America to the

NAVY SEAPLANE HANGING LOW OVER A HEAVY SMOKE SCREEN THROWN OUT BY A DESTROYER FLEET

This picture, taken near San Diego, California, shows the plane veering to the left to dodge the black clouds. The plane is co-operating with the battle fleet, being employed to direct its actions behind the smoke screen

far east. It is a kind of realization of a palæontologic Garden of Eden—of the birthplace, or Asiatic homeland, from which many kinds of reptiles and mammals spread westward and eastward.

The value of the discoveries may be of basic importance in the large aspects of evolution, and it is hoped that further work may bring out similar evidence regarding the early history of the "primates" from which man is held to have evolved.

The story as told by Dr. Osborn in the current issue of "Asia" is a fascinating episode in the always enlarging chapter of scientific research.

THE AIRPLANE AND THE BATTLESHIP

THE recent bombing by airplanes of the British pre-war dreadnought Agamemnon confirms the conclusion of the demonstration off our Virginia capes a year ago. But those are totally wrong who suppose the conclusion to be that the day of the battleship is over. On the contrary, the navy has gained a new and potent weapon. Hereafter warships will carry fighting airplanes and bombing airplanes, and a major engagement at sea will have its attendant or precedent battle of the air.

Those who have read the articles in The Outlook by Lieutenant Clifford A. Tinker, of the United States Bureau of Aeronautics, have learned what advances have been made in the planning of small fighting planes, in the devices for launching them from vessels, in "landing" them safely at sea, and in building

aircraft carriers. They have learned also how the Germans, debarred from building large commercial planes lest they be turned into bombers, have built small, low-powered, short-range planes and are now making fast little monoplanes that, in Lieutenant Tinker's judgment, form a menace to the peace of Europe. All signs point to new and different developments in future wars of the air, but the new weapon will be an adjunct of navies, not their supplanter.

The attack on the Agamemnon was a startling demonstration, for if the "bombs" dropped upon it had been war bombs instead of "duds" the vessel would have been destroyed a dozen times over. Some four hundred of these dummy bombs fell on and around the war-vessel with a degree of accuracy that showed the efficiency of recent sighting devices. The Agamemnon was controlled and maneuvered by wireless and was moving at fifteen knots an hour. Many of the bombs were dropped from a height of 8,000 feet, at which height an airplane is practically immune from anti-aircraft firing. Not only were 400 bombs dropped on or close to the Agamemnon, but some of the fast planes flew so low as to sweep the decks with machine-gun fire. One result of the demonstration was that the British Government at once announced its agreement with the Air Minister's plan of providing a new air force of 500 planes for home defense, at a cost of about ten million dollars a year.

There is evidently a use for airplanes apart from the navy, but there is most

emphatically also a use for airplanes working and fighting in conjunction with the navy.

THE SUPREMACY OF THE GERMAN GLIDERS

TWO weeks ago Lieutenant Tinker, in the most recent of his Outlook articles, gave what is probably the first authentic statement of the achievements of the Germans in the art of using gliders. By experimentation the Germans, as he pointed out, have "built new and stable gliders, and with them have accomplished soaring and gliding flights which equal, and in some respects excel, the performance of huge birds."

Since that article appeared the Germans have made astounding advances in this new art. The record made some months ago by Harth of a gliding flight of twenty-one and a half minutes has been totally eclipsed by a flight made by a young student named Hentzen which lasted for ten seconds over two hours. More than that, extraordinarily accurate landings were made in a contest in which a point was designated near which the competitors sought to land. The victor in this contest of "goal flying" succeeded in landing within thirteen feet of the goal.

Lieutenant Tinker said that the earlier efforts in gliding were regarded by the Allied officers as a mere school-boy craze, but later became a matter of concern and even alarm. Now it is reported that the French see in these German accomplishments a serious threat to their own air supremacy.

It is said that these records made in Germany did not depend upon a very high wind. In fact, during the competition the wind varied from twelve to eighteen miles an hour, and some of the gliders kept in the air in a breeze of less than nine miles an hour.

Simultaneously there have been gliding flights in France. The best French record up to August 21 is an endurance flight of five minutes. This record was made by a Frenchman, who succeeded in making also the best record in the total time aloft, which amounted in all his attempts to a sum of fifty minutes. These French records seem absurd in comparison with a German flight of two hours.

It is said in explanation that the German trials were under much more favorable conditions and at a much more favorable locality. Wasserkuppe, in the Rhone Mountains, is declared by Edmund Allen, the American participant in the French contests, a student at the Massachusetts Institute of Technology, to be three times as high as Combe-grasse, where the French contests were held, and better for its rising currents of air. The contests were to continue in

both France and Germany. The later French contests were to be made at a higher point.

INTERNATIONAL TENNIS

VERY few ambassadors accomplish more for wholesome and friendly international relations than sportsman-like contestants in international games. The very idea of sportsmanship has served as a test by which to distinguish between the conduct of civilized and barbarous people in even the grim contest of war; for experience proves that advantage rests with soldiers who know how "to play the game." Much more in times of peace is the attitude of good sportsmanship a test of amicable relationship between one people and another. Nothing in recent years has done more to prove that East and West can meet than the encounters between American players and the two members of the Japanese Davis Cup team, Ichiya Kumagae and Zenzo Shimidzu, who became affectionately known as Ichy and Shimmy and whose whole career reflected honor on Japan and created good feeling in America.

American relations with France and Spain are undoubtedly to be appreciably affected for good by the coming to this country of the French and Spanish Davis Cup teams.

France has already established her place in tennis by the skill and power of her representatives in other years, and in particular by the supremacy of Mlle. Lenglen over all other women players of the world. This year, however, the French players have made an especially strong impression. The French team entered for the international matches of which the Davis Cup is the trophy was defeated by the Australian team, but the names of Gobert, Cochet, and Borotra will be remembered in tennis annals.

What perhaps was the sensation of the Davis Cup contests this year was the playing of the Spaniards. It is said that no player in the world is quicker on the ball than Manuel Alonso. He showed himself one of the masters of the game in his defeat of the Australian Pat O'Hara Wood. The Spaniards and Australians broke even on the first day of the singles matches, but the Spaniards lost the doubles match on the second day, and then, after a spirited contest, lost the two remaining matches in singles. The three Spanish players—Señores Manuel and José Alonso and Count Manuel de Gomar—have reinforced the French players in dispelling a good many illusions about the Latin temperament. The so-called Anglo-Saxons of the English-speaking peoples—and we count in that category those who are Celts as well—have done a

AUSTRALIANS DEFEATING THE FRENCH IN THE DAVIS CUP DOUBLES

The French players, André Gobert and Henri Cochet, are in the foreground; the Australian players, Gerald Patterson and Pat O'Hara Wood, are on the further side of the net

great deal to establish standards of amateur sportsmanship; but these French and Spaniards and other players that no one would dream of calling Anglo-Saxon are helping to make standards of good sport (which, after all, are only standards of fine conduct in all competition) a universal rule.

THE CONFLICT OF INTERESTS

IN a fight for principles even defeat brings with it some measure of satisfaction. There is an element of joy in being a soldier in the noble army of martyrs. To fight, however, for something that is not a matter of principle and then to be beaten is to taste bitterness. That is why American politicians are so uneasy in any tariff campaign. They know very well that there are no political principles involved. They have no righteous cause by appeal to which they may seek to rouse the people to action. They have no political ideal for the sake of which they might ask their party to risk success. The only justification for a course in respect to the tariff is the honest opinion that that will lead to a result approaching practicable justice and a fair distribution of benefits.

It would be very much simpler for the politicians and much less confusing to the voter if the two major parties of the country were divided on the tariff according to some fundamental policies. As we pointed out last week, however, neither party has ever undertaken to carry out a tariff policy based on a simple and basic political theory. If one

party had said that it would direct its course toward making of the tariff a Chinese wall and the other party had directed its efforts to the abolition of all tariff duties, there would have been alternatives presented to the voters which they could have understood and on which they could have made their choice.

Instead of dividing on the matter of principle or theory, the two parties have been in practical agreement in upholding the general policy of a tariff of adjustment or regulation with a view to both revenue and protection.

This policy, which is not a party policy but a National policy, has not been agreed upon because it is simple. On the contrary, it bristles with difficulties. Just because it is a policy of adjustment it cannot ever place the tariff in the category of settled questions. Congress has often been denounced for its proclivity to "tariff tinkering." It ought not to be blamed for this. If it is going to do the will of the people of America, who have evidently committed themselves to a policy of adjustment, it must provide for tariff tinkering of some kind. If Congress were allowed to build up a Chinese wall, it could probably build it high enough and strong enough to last for many years without repairs or additions. Or if it were allowed to do away with the tariff altogether, it would not need to be bothered with questions of specific rates on this and ad valorem rates on that, but could relegate the tariff to the limbo of forgotten issues. So long, however, as the people want neither exclusion of imports nor free trade, Congress must keep continually changing the tariff gears in order to ac-

commodate the power of the commercial engine to the constantly changing economic grade.

Since, then, there have to be frequent changes in tariff schedules, the various interests affected become at once parties to the tariff controversy.

These interests are chiefly of two kinds.

In the first place, there are the interests of one locality or section of the country conflicting with the interests of another.

In the second place, there are the interests of the producer as contrasted with the interests of the consumer.

As a consequence every tariff bill as soon as it is introduced into Congress becomes the target of criticism from every angle. It is bound to cause dissatisfaction, in varying degrees, among all the interests involved. The wool grower wants the tariff rate on foreign raw wool high; the wool importer wants it low. The sugar refiner wants a tariff rate that will give him a wide market in which to choose the cheapest raw material; the sugar grower, on the other hand, wants to limit the refiner's market in order to avoid the danger of finding his foreign competitor's product offered for a price that does not meet his own cost of production. Every interest is tempted to believe in a Chinese wall tariff for its own product and free trade in the products that it needs to buy. Thus it comes about that under the American policy, which is neither distinctively Republican nor distinctively Democratic, the tariff, as Hancock once said, is a local issue. The task of Congress, whether it is Republican or Democratic, is the disagreeable one of finding some series of compromises which will be productive of the fewest political enmities. In the enactment of every tariff law the members of Congress are sure to cause dissatisfaction to practically every interest. We do not recall a tariff measure that has won hearty praise from anybody except its own sponsors. Such a result of dissatisfaction is inevitable in any attempt to reach a compromise between conflicting demands.

If the task of reconciling these local interests is difficult, the task of reconciling the difference between the interests of the consumer and those of the producer is impossible.

Practically everybody in the country is both producer and consumer. It would seem, then, that it would be easy to lead an individual citizen to see that he would have to strike a balance between his own conflicting interests. It would be easier if each citizen were a producer of one thing and a consumer of another, or a producer of everything and a consumer of everything. What

creates the difficulty is the fact that each is directly a producer of only one or two things while a consumer of virtually everything.

The natural consequence of this fact is that the interests of producers are divided, while the interests of the consumers are to a very large degree united. On another page we print in a group of cartoons one representing the citizen as heavily loaded with the burdens of various duties—on clothes, on shoes, on cotton goods, on utensils, on sugar, on food. This is the sort of cartoon that appeals to everybody because everybody is a consumer. If, however, it pictured the producer of shoes, either capitalist or wage-earner, as using the power of the tariff on foreign-made shoes as an automobile to help him carry his packages, the cartoon would have a very limited appeal because it would appeal only to the shoe producers. And even that cartoon would have to show, in fairness, a gasoline tank labeled "Free Hides." Thus it happens that, while the demand upon each Congressman is for the protection of the commodities produced among his own constituents, the attack on Congress as a whole for protecting those industries in the aggregate is nearly overwhelming.

Congress is thus faced with a dilemma. If it refuses to touch the tariff, it is charged with being unresponsive to the demand for adjustment of the rates to changing conditions, while if it begins to touch the tariff it is threatened with all sorts of punishment.

In a future editorial we shall consider some of the conditions which make this dilemma peculiarly perplexing at this time and the efforts which Congress has made to escape from it.

THE ALMIGHTY SOLVENT

THAT was a delightful essay in last week's Outlook on certain characteristics of the black American by Archibald Rutledge—a South Carolinian who knows his English poets, his classical philosophers, and also the red fox, the wary otter, the bull alligator, the droves of wild turkeys, the flocks of wild ducks of the Southern uplands, swamps, and seacoast. He knows the old-time Negroes of the South, too, and has drawn the portraits of three—Sam, Peter, and London—that make the reader wonder whether there might not be a rising tide of color, which Lothrop Stoddard does not take into account in his lugubrious prophecies, that would be a blessing instead of a curse to humanity.

It is not, however, the poetry, the outdoor flavor, or the skillful character

drawing in this essay of which we wish to speak—although it might be said in passing that Archibald Rutledge is uncovering a new vein of fine literary art in the South. It is not because his paper is redolent of pine and cypress and musical with the call of game birds and the beat of hoof and patter of paw; not because it combines so pleasantly the virility of the woodsman with the shyness of Nature in her poetic moods; not because it is comparable to the best work of Richard Jefferies or W. H. Hudson or William Beebe or John Burroughs, that we comment upon the essay here. It is because it ends in a shocking paragraph of morals—shocking, we mean, in the simple sense that, wholly unexpected in such a context, it arrests attention. The paragraph reads:

In these days we hear much of this problem and of that; of the industrial problem, of that of immigration, of that of the Negro. But I take it that there is no problem, local or National, which does not resolve itself into a human problem, and therefore an individual problem. "Love thy neighbor as thyself" is a mystically profound and all-powerful command. The so-called trouble between the Negro and the white race is identical with the trouble between any two individuals of any race or age who do not understand each other and do not wish each other well. The hearts of all of us are infallibly human; and by the truth of such a statement all of us are indicted; for, since we are human, we are liable sometimes to be intolerant, selfish, unappreciative of another's position, needs, hopes, fears, desires. The Golden Rule is the almighty solvent for all human ills of the character in question; one touch of its wand, and the shadows of ages flee away.

How simple it all sounds, and yet in how heartbreaking a fashion we all neglect the Rule by which most of our social and political problems might be solved! The encouraging thing is that, while creeds and rituals, while archiepiscopal letters and Papal bulls pass away, the Rule, in spite of the cant and hypocrisy with which it is often enmeshed, still persists in impressing mankind with its reality. Even the literary revolutionists, who are determined to cast aside all man-made schemes of morality and portray life as they think it really is, come back to the Rule as a standard and measure of human beauty. Theodore Dreiser can hardly be called a sanctimonious preacher of puritanical morals, and yet from the point of view of literary art he has never done anything better than his studies of the effect of obedience and disobedience to the Rule upon the lives of three of his "Twelve Men"—a country doctor, a country storekeeper, and a country workman.

In "If Winter Comes" and "The Clean

Heart," the best two of A. S. M. Hutchinson's deservedly popular novels, the author actually, although we hasten to acquit him of any ulterior or cunning moral design, sets forth the supreme happiness that practice of the Rule brings into life. More than that, he discloses one of its often hidden but most golden qualities—it does not require self-sacrifice, but only that one shall not sacrifice others to one's own selfishness.

Archibald Rutledge is right in calling the Rule the almighty solvent.

THE HAPPY DE MORGANS

THERE is no more delightful and entertaining reading than biography, provided that it has certain requisites: the lives described must be worth while; the material available must be warm with the glow of human nature, not mere arid records; the author must have ability to put before his reader traits and personality with ample use of incident, anecdote, and humor. It is because the recently published volume entitled "William De Morgan and His Wife"¹ has just these qualities that it is a welcome and enjoyable addition to literature. The book is made beautiful by fine reproductions of over twenty photographs of exquisite specimens of Mr. De Morgan's pottery and Mrs. De Morgan's paintings, so that it gives pleasure to the eye as well as to the mind. The author is Mrs. De Morgan's sister; she is an experienced biographer; her intimate knowledge of those about whom she writes, joined to sound literary judgment, made her the one person admirably equipped for this particular task.

Rightly this is quite as much the Life of Evelyn De Morgan as of her husband. It was one life; they were closely associated in art, in his literary success (which was due to the impulse he received from his wife), and in their friendships with Burne-Jones, Rossetti, Morris, and others. No two lives that had to do with imaginative work were ever so tied together unless those of the Brownings. Sir William Richmond, their old friend, who writes the book's preface, says:

It is seldom that a marriage is absolutely successful, where the road of life taken is so similar, where the temperaments are completely in accord, and where no commonplace rubs against life's sharp and tiresome edges ever occur. Evelyn and William De Morgan were absolutely one: one in sympathy, in intelligence and its direction, one in tastes, and in perfect companionship. They teased and

chaffed one another as schoolboys do, they were amused at each other's idiosyncrasies, and I verily believe amused also at their mental similarity. He believed in her Art and she in his. They were both artistic in the highest sense, and where the business capacity came in is a puzzle to every one.

The story of the way in which De Morgan came to write "Joseph Vance" has often been told, but never so vividly as in this book:

Some time before, in 1901, during a spare hour, he had written two chapters of a novel, "just to see what I could do," he explained subsequently; "I always loved grubby little boys, and I thought I should like to write the story of a grubby little boy. I began and got interested in him. But when I read over what I had written, I was so little impressed with the result that I nearly burnt it; in any case I put it away in a drawer and forgot all about it. Later in the year, when we were going out to Florence, it accidentally came with us among a great mass of business papers." Turning out these papers some time afterwards, he tossed the despised manuscript with a heap of rubbish into the waste-paper basket, where by chance his wife saw it, and glanced casually at it before consigning it to the flames. The story, with its graphic, sordid realism, at once gripped her attention; she set it carefully aside and awaited her opportunity.

Shortly afterwards De Morgan was ill in bed, suffering ostensibly from influenza, but principally from the unwonted idleness which filled him with depression and sapped his vitality. Evelyn took the piece of manuscript to him and laid it by his bedside, with a pencil temptingly adjacent. "I think something might be made of this," she said briefly. When she looked in softly half an hour later, he had started on the occupation which he was never again to abandon, and was writing rapidly.

What is not so well known, however, is that De Morgan, having once started in his novel writing, kept on with tremendous energy regardless of success or failure. Publishers not unnaturally hesitated a little at the length of "Joseph Vance," and before it had actually seen the light "Alice-for-Short" and "Somehow Good" were finished.

De Morgan failed as a commercial potter, but he did not fail as an artist in ceramics. One art critic, for instance, has said since De Morgan's death that the things by De Morgan that were shown in 1914 at the British exhibition in the Pavillon de Marsan "glowed there among the dim splendors of pre-Raphaelite survivals, evidence of a complete union of art and craft such as rarely is found in modern times." So that has come true which De Morgan himself playfully said after his factory failed: "All my life I have been trying to make beautiful things, and now that I can make them

nobody wants them. Only my own extinction can make them valuable."

What made De Morgan's novels—all written, remember, after he was sixty-five years old—was exactly that which one finds everywhere pervading his letters. They have humor, playfulness, sympathy, and admiration for what is high-minded and honorable, a philosophy that is optimistic and cheerful, together with the born story-teller's sense of plot and character. He liked "Joseph Vance" best himself, probably because its humor was liveliest; many of his admirers would put "It Never Can Happen Again" or "Somehow Good" first for choice. He wrote nine novels, two not quite finished when he died, and at least five of these were richly and abundantly good. And this from a man who had spent his energy up to his sixty-sixth year in producing pottery and tiles! His wife's painting—modest as she was about it—received more praise than his ceramics. Mrs. Stirling tells us that "her husband, as success came to him, facetiously remarked the *volte-face* in their respective positions: 'Formerly it used to be Mrs. De Morgan and her husband, now it is Mr. De Morgan and his wife!' Of all which he owed to her, however, he was profoundly aware, and once when some one was talking in enthusiastic terms of his genius, he cut short the panegyric gently by pointing to the 'real Janey': 'There is the genius,' he said."

The letters in this book are capital; even the boy De Morgan's illustrated letters are good fun, and one later illustrated letter from him to a boy—reproduced in facsimile—is quite like those that Theodore Roosevelt used to send his children. De Morgan's letters to Burne-Jones and the replies are especially full of humor and have interesting side glimpses at art and literature.

There are lessons in this record of two busy, happy, and loving lives—lessons too obvious to need pointing out. We may suggest them, however, by quoting a deserved tribute paid to William De Morgan by Professor William Lyon Phelps at the close of an appreciative article on Mrs. Stirling's book: "To me he is one of the world's great humorists, who regarded the show of life with that clear-sighted tolerance that only humor and sympathy can give. And no one can read this biography without a sense of gratitude toward the author of it, first, for presenting to us so clearly a remarkable personality, and, second, for the proof that such a personality gives of the possibility of living a cheerful, happy life, provided one lives from day to day, taking happiness as it comes without discontent, and without crying for the moon. For if any man in this imperfect world ever lived happily, that man was William De Morgan."

CHRISTY MATHEWSON

SPECIAL CORRESPONDENCE FROM FREDERICK M. DAVENPORT

THE other day I read in The Outlook the editorial on Christy Mathewson entitled "The Fight of a Clean Sportsman." I have often wondered what gives Mathewson such a continuing hold on the affection and the respect of great numbers of the American people, whether the particular baseball public or others. I had never met him, though I have seen him pitch in other years and have been impressed by the remarkable personal as well as physical self-control which he exhibited, a quality to which The Outlook called attention in its editorial.

Last week I happened to be motoring through the village of Saranac Lake where Mathewson for two or three years has been making his stand against the grim enemy of tubercular disease. The editorial came to my mind, and I thought I would look Mathewson up. I asked the boy behind the soda-water fountain in the village drug-store if he knew where Mathewson was residing. "Sure!" he said. "Ninety Park Avenue." I wended my way up towards the locality, and, not finding the place at once, inquired again of a young miss. She exhibited the same familiarity with the number and pointed out the house. I found Mathewson resting easily in a long porch chair, and in good color, flesh, and spirits.

I had no thought of interviewing him or, indeed, of writing about my visit. It was only a friendly call upon a man who was brought up on the edge of a country village in Pennsylvania near which I spent my own boyhood. I quote from the conversation only those points which I am sure would not be embarrassing to him but which are so illuminating of your editorial that I am sending them to you.

I found, when I left, that I had a peculiar sense of the quiet poise and generosity of spirit of Mathewson. I felt that there was something about it worthy of imitation by all those who look for success similar to his in any field of life. He was associated from 1901, when he first pitched in a professional game, until Labor Day, 1916, when he pitched his last game, with many rough and plain citizens of the Republic who were his comrades in the struggle for the pennant of victory. He would be the last to concede it, but he himself was a thoroughbred in native stock and educational training compared with most of the men with whom he was surrounded. But his estimate of them, I found, was high. He said that they came from the mines and the farms and from many walks in life, but that they soon acquired in their new and trying environment a practical education which developed their personalities and made them very interesting and companionable associates. I said nothing to

him about it, but I have often heard elsewhere surprising stories of the influence Mathewson had upon them, of how the coarse or profane badinage of the clubhouse suddenly ceased when Mathewson walked in. There was no awe about it. They just didn't want him to hear it, that was all. It didn't seem appropriate. Incidentally, my recollection is that, while Mathewson never posed as a saint, he thought it was a good thing for the country to keep the dollar mark off Sunday, and so always declined to play professional profit-making baseball on that day.

This democratic instinct for doing the plain right thing grew up with him in the simple country village of Factoryville, Pennsylvania, where he passed his boyhood. The doctors let him go back there last week by automobile to spend his forty-second birthday with his father and mother. The press throughout the United States carried news of the event and of how the countryside turned out to greet him. He told me at Saranac of his boyhood at Factoryville. Baseball was his early passion. He liked it so much better than hoeing potatoes on the little farm near the village. "I remember," he said, "the first game I ever pitched for money. Factoryville didn't have a team of its own, but when I was fourteen years of age a club at a little distance away offered me one dollar to pitch nine innings, and I was to pay my own expenses. I would have been willing to have paid them a dollar, if I could have scraped it together, for the privilege. Nothing seemed so much worth while to me."

I learned where he acquired that terrible accuracy which disconcerted many a batsman in the National World Series in later years. "I regret very much," he went on, "that I developed a deadly aim in my boyhood by throwing stones at birds. I was responsible for slaughtering a good many of them, I am sorry to say."

We fell to discussing the salaries of big players. "They are very much larger now than they were in my day," said Mathewson. "I began at \$250 a month for six months' work. Even at the height of the period the best players got only from \$7,000 to \$10,000 for the season. Now I hear that Babe Ruth gets somewhere near \$40,000 a year."

Here was an opening. I said, "Isn't Babe Ruth growing irascible and showing pretty poor self-control?" Instantly the poise and breadth of sympathy of Mathewson showed itself. "Well, I don't know," he replied. "Self-control is a wide word. Sometimes the management doesn't think a player has self-control because he exercises his own judgment at the bat instead of following implicitly the directions of the coach. Ruth is what he is. It is his temperament

which makes him so valuable to baseball and so worthy of his salary. The mass of people on the bleachers care most for a man whom they can cheer to-day and jeer to-morrow, and Ruth fits into that picture. He is on the heights when the bleachers rock with applause, and he is correspondingly depressed and irritable sometimes when the great crowd turns on him because he doesn't produce the thrills. It is all in the mercurial temperament. And it is the very thing which gives Ruth great money value. Now there is Sisler, of the St. Louis team—he is every bit as valuable a player as Ruth, some people think more valuable. But he has another temperament. When he makes a great hit or a great play and the crowd are ready to idolize him, he modestly touches his cap and fades away out of sight. He doesn't fit into the picture."

Mathewson was surrounded with vases of wild flowers. I spoke of them, and he said: "Oh, yes. The doctor lets me take about twenty minutes' quiet exercise twice a day, and so I have been studying botany and brushing up upon the wild flowers about Saranac, so that I will know their names when I see them again. It is fine to be able to get about a little." This big six-footer, who now weighs again 204 pounds, was down to 150 pounds a year and a half ago when the fever laid hold upon him. If he gains for six months more, or at most a year, the doctors have great hopes of a permanent cure.

I remembered that The Outlook editorial was not quite positive as to whether Mathewson was with the American Expeditionary Forces in France when disease overtook him. I asked him about this, and he said that he was the assistant gas officer of the Twenty-eighth Division, but that his health began to fail only when he had been back in this country several months.

Such a mellow, sane, intelligent, self-controlled personality I have rarely talked with. As I walked away I felt that it had been good to be with him and that the American people knew what they were about in keeping an eye of affection upon this great human athlete in his lonely struggle. It is an astonishing thing that six years after he pitched his last game the solicitude of millions should follow him as eagerly as ever. I read an editorial in the "Evening Bulletin" of Philadelphia last week to the effect that every decent American ought to put up a prayer for him on his forty-second birthday, because every decent American ought to want to help to pull him through. There may be something inscrutable, but there is something very real and deep about such a carrying personal influence. The secret is to be found, I reckon, in genuine character that has produced the goods. The

(C) Keystone

American people care very little whether the field is baseball or politics or religion. They know the real thing. I was talking to a companion at a dinner party in Pennsylvania the other night

about my impressions of Mathewson at Saranac, and before I knew it everybody at the table was listening. When I had finished, a well-known director of music who sat on my left said, "I have two

boys, and next to Theodore Roosevelt their ideal is Christy Mathewson." Well, after all, it is the same thing. Whoever is as big as the best in the American people is the idol of all of us.

CONDITIONS IN BRITAIN

I—A GLIMPSE OF ENGLAND

SPECIAL CORRESPONDENCE BY FRANCIS ROGERS

IN July, 1921, England was burned brown by a pitiless, prolonged drought, the value of the shilling was only 18 cents (a drop of 6 cents since 1914), and the evidences of appalling unemployment were to be seen on every side. England was carrying on bravely, but grimly, concealing her many scars and infirmities as best she could and meeting her multitude of new and perplexing problems with the suppleness born of long experience, with which she has been able so many times to circumvent her difficulties.

In July, 1922, abundant rains have restored England to her normal verdant, fertile self, the shilling is worth 22½ cents, and official figures confirm the superficial signs of a substantial reduction in unemployment. So much as this one may discover for one's self in a few hours; it would be a long task, and one for which I am not competent, to offer a comprehensive and reliable estimate of England's condition at this time. All I shall attempt here to do is to transcribe for the readers of *The Outlook* a few glimpses of the England I have been in these past three weeks.

It is only little by little that one can take in the enormous price that England has paid and will for years to come continue to pay, for her participation in the war. Our own country is rightly proud of her share, but when one is in England one comes to realize that America, despite the magnitude and intensity of her effort, suffered but little in comparison with the older country. England put all her man power into the war, and, in addition, mobilized her woman power to an extent unequaled by any other great nation. Over two hundred thousand women were in uniform under Government discipline; this without counting the myriads of women engaged unofficially in war work. All England's material power was pledged to the winning of the war. In 1922, four years after the war, the English are the most heavily taxed people in the world. Of its actual fighting men the greater part are dead. (I was told the other day that in one small counter-attack in Belgium six years ago all but one out of forty-three officers were killed.) Forty-seven thousand veterans are now in hospitals and never will leave them

alive; some six thousand are totally blinded. Such figures as these might be extended indefinitely, all pointing the same moral: that these burdens and bereavements England incurred in our behalf, as well as her own, wherever she faced the Germans. Surely it were contemptible in us now to show ourselves, rich and all but unscarred, anything but generous and sympathetic in our dealings with our late allies.

The great need of England, if she is to get firmly on her feet again, is productive employment, and yet while I write Congress is trying to enact a bill to reduce trade with England. With one breath we ask her to repay what she borrowed from us with which to defeat our common enemy; with the next we would deny her the ability to do business with us. To-day the Balfour Note has been published, and England is awaiting America's response; I wish I felt sure that it was to be as magnanimous as the circumstances merit!

Rural England is again a delight to the eye. Its fields are full of grazing flocks and herds, or of yellow grain. Its trees are as opulent as ostrich plumes,

"IT IS GRATIFYING TO OUR NATIONAL PRIDE TO SEE HOUDON'S STATUE OF WASHINGTON GAZING SERENELY OVER TRAFALGAR SQUARE IN THE DIRECTION OF THE HOUSES OF PARLIAMENT AND SAINT-GAUDENS'S LINCOLN PLACED DIRECTLY ACROSS THE STREET FROM THE ENTRANCE TO THE ABBEY"

Photographs copyrighted by the Keystone View Co.

and in their luxuriance and symmetry seem never to have known either animal or vegetable blight. This great fertility must mean prosperity to the farmer, although I am told that the general use of harvesting machinery works much to the disadvantage of hand labor, which used to count on the returns from the harvesting season. Industrial England is still in a parlous state, waiting for the resumption of trade, upon which, indeed, the prosperity of the entire world depends.

In matters artistic England is on the upward grade. The Royal Academy exhibition, though by no means epoch-making or revelatory of new genius, is the best since the war. I arrived too late to hear any of the performances of opera in English that signalized the spring season, or any important concert, but I know from other sources of the excellent promise of the young English composers. Among the dramatists Milne is the most prolific in the field of light comedy; Galsworthy's "Loyalties" is the strongest of the new plays. I spent six days at Stratford-on-Avon and witnessed eight performances of the New Shakespeare Company in the Memorial Theater.

When an Englishman comes to the United States, his first interests are the sky-scrapers and Niagara Falls; the American seeks first Westminster Abbey, then Stratford. All summer long our doughty tourists have streamed through this little Midland city, hurrying from Shakespeare's birthplace to his tomb by way of Anne Hathaway's cottage and the

grammar school where the poet learned his "small Latin and less Greek" (or, probably, no Greek at all). Too few of them know that on the banks of the smiling Avon is a theater in which during the summer weeks an admirable company of players, talented, ambitious and thoroughly trained, give daily performances of eight of Shakespeare's plays, changing the bill at every performance. It is a stock company, in which every player holds himself ready to play any part assigned to him. The Mark Antony you admire to-day will be an even better Iago to-morrow; the charming Rosalind will as Cleopatra sweep you off your feet. Our country has known no such competent company in a generation. This summer they are playing also "The Rivals." Iago, Othello, and Emilia gave exhilarating impersonations of the two Absolutes and Lydia Languish. The delightful old comedy is produced according to Sheridan's own version, and not "with Sheridan twenty miles away," in the guise inaugurated by Joseph Jefferson and revived by The Players in New York last spring.

The stage management of the Stratford Company is thoroughly intelligent; the scenery is adequate, though so simple as to permit the rapid shifts necessary for a lively performance; the costumes are for the most part those given to the Memorial Theater by Sothorn and Marlowe when they retired from the stage some years ago. Across the street from the theater are the assembly-room and reading-room of the English-Speak-

ing Union, that valuable institution that is doing so much on both sides of the water to make Americans and English understand and thereby like each other better. The Stratford Company would welcome an opportunity to make an American tour, but, unfortunately, they have not yet been able to secure the financial backing for the venture. A visit from them would be an important beneficial event in our theatrical life.

I cannot conclude these random notes without speaking of the friendliness and courtesy that follow the visitor wherever he goes in England. To a New Yorker, not used to considerate treatment in the streets and other public places, the good manners of the English are especially ingratiating. It is also gratifying to our National pride to see Houdon's statue of Washington gazing serenely over Trafalgar Square in the direction of the Houses of Parliament and Saint-Gaudens's Lincoln placed directly across the street from the entrance to the Abbey.

Washington, Lincoln, Shakespeare, and a thousand other great traditions the two nations share with each other; the war has forged a thousand new links in the chains that bind our destinies together. Unless the two nations continue to make common cause against the powers of disruption now so rampant in the world, the future of civilization is black indeed. England will spare no pains, I am certain, to continue this union of effort. Let us pray that the United States may not be found wanting in the critical hour. If any American

thinks that England needs us more than we need her, he will do well to study an English newspaper and see how England's interests reach to every corner of

the world and certainly do not focus on us. No, the prosperity and general welfare of the British Empire are of incalculable value to us, and, even if only

from self-interest, we should strive to further them by every means in our power.

London, August 1, 1922.

II—IRELAND AND BRITISH "EMPIRE" DEFENSE

SPECIAL CORRESPONDENCE BY MAJOR-GENERAL SIR GEORGE ASTON, K.C.B.

IT would be rash to predict anything of unhappy and turbulent Ireland, but there is at least better ground than before to trust that order will be established, the liberal Constitution offered the Free State by Great Britain be formally accepted, and representative government put on a sound and permanent basis."

I am encouraged to write this article by the above extract from *The Outlook* of July 12, and by a previous reference therein to General Jan Smuts as having, more than any other man, convinced the Irish people at large that, whatever their aspirations for independence in the far future, they may well be willing for the present to have the liberty of action and self-government that satisfies the Canadian, the Australian, and the citizen of the South African Republic.

I had the good fortune to be serving in South Africa at the time of the Union, a critical period in South African history. Towards the close of 1908 I presided at Durban over a conference between representatives of what were then four self-governing "colonies"—Cape Colony, Natal, the Transvaal, and the Orange Free State—about mutual defense, one of the levers by which Union was achieved. In 1912, after the Union, General Smuts handed over to me at Bloemfontein about fifty officers to be trained as the Staff Officers of the new South African Defense-Force. Half of them were British South Africans and half were Dutch South Africans. Most of them, only ten years before, had been fighting each other to a finish in what, in those days, we used to call "the" war. In my inaugural address I told them that they had before them the ideal of a South African nation, that the spirit in which they would work would be a South African spirit, that upon them, more than upon any other public servants, would the success of the South African nation depend; because the South African forces formed one of the most important, if not the most important, indications of South African nationality. General Smuts said, in an inspiring speech: "South Africa must not have a Boer army or an English army, but a South African army," and, he added, "If you succeed, as we believe that you will, you will not only produce an army but a nation." That was just ten years ago this month. Those ten years have seen a South African army, so created, put down three rebellions in the country, and stand shoulder to shoulder with British, Canadians, Australians, New Zealanders, and Indians—not to mention men from all other parts of the British "Empire"—in defending

the anti-imperialistic ideals for which that very misleading expression stands. Regardless of their racial origin, Dutch and British combined to form the South African army which, at Delville Wood, made the name of South Africa famous throughout the world, and every South African proud of his nationality.

I remember, during those days of South African Union, reading over and over again F. S. Oliver's "Alexander Hamilton" and Gertrude Atherton's "The Conqueror," which adds so much human interest to the tale of the Union of the States of America. I also remember wondering, in view of the subsequent experience of the influence of States' rights in bringing about the Civil War, how such matters would stand in the new South African Constitution. This Constitution turned what had been independent self-governing colonies into "provinces" with little vestige left of their independence, only such matters as primary education and the upkeep of roads being left to the provincial administrations. For contiguous states, grouped in the same nation or community, a central or Union Government was established having full power over finance, economics (through control of railways, customs, and taxation), and defense, including police. It is with defense that we are here concerned, with the influence of the new Irish Free State Constitution on the problem of British "Empire" defense.

We see in Ireland, now being accepted, a policy which is the exact opposite to that adopted for contiguous "colonies" in South Africa at the time of Union; it is a policy similar to that adopted for the British Commonwealth of nations which are not contiguous but remote from one another, spread all over the world. The expression "British Empire" does not occur in the Irish Free State Constitution; "British Commonwealth of Nations" is there used officially for the first time, to the best of my knowledge. The South African policy is being reversed, and, instead of trying to incite a national sentiment in the United Kingdom by maintaining one British army, the historic South of Ireland regiments with their wonderful war records have been disbanded. The Irish Free State, in this matter, has been given what has loosely been called "Dominion status." That expression as applied to Canada, Australia, New Zealand, and South Africa means virtual independence, the only official links being allegiance to the same constitutional sovereign, and, to a decreasing extent, the appeal by citizens to the same final court of appeal, the Judicial Committee of the Privy Council in Lon-

don. It means, from the defense point of view, the right to maintain sea, land, or air forces and fortified bases from which they can operate, without interference by any external authority. It does not and cannot mean the same for the Irish Free State. This should be clearly understood, to avoid misconceptions and accusations of ill faith, of which we have had enough in the past. The late Admiral Mahan wrote: "Ireland by its geographical position stands across and controls the communications of Great Britain with the outside world." The British people are unwilling at the present stage to run the risk of their communications with the outside world being controlled by a nation constantly proclaiming its hostility to everything British. To that extent, and only, I believe, to that extent, the Irish Free State Constitution does not confer "Dominion status."

The establishment of a virtually independent nation in territory hitherto included in the United Kingdom has already had one good result. It has exploded once for all the myth about the attitude of Britain to Ireland. All that the British have done for many years has been to try to keep the peace in Ireland between Irishmen of different views and religions. By so doing they have incurred such bitter hostility as to give rise to the saying that England's trouble would still be Ireland's opportunity. The use made of that opportunity in the Great War sorely weakened the British army, owing to the need to keep large forces in Ireland at a most critical period. In the words quoted above from *The Outlook*, there is at least better ground than before to trust in the future. Much will depend upon the success of the recent appeal by the Provisional Government of the Irish Free State to the agitators and enthusiasts who "make dishonest appeals to emotions, founded in many cases upon deliberate falsehoods."

The establishment of the Irish Free State will, on the one hand, throw upon the English, the Scots, the Welsh, and the Ulstermen, still grouped in the United Kingdom, an additional share of the white man's burden of empire proper, a burden which is not shared by Canada, Australia, or New Zealand, though it is by South Africans, who govern five times their number of native races. On the other hand, if the experiment succeeds, as we hope and believe that it will, the army maintained by the still United Kingdom will be more free to accomplish its mission in Empire defense, the maintenance of order within, and defense against invasion from without.

SHALL WE FORGET THE LUSITANIA?

BY SAMUEL FLAGG BEMIS

THEY say a good story has been going up and down the boulevards of Paris. It is one which may get written into our school texts of American history.

An American doughboy was captured by the Germans. He was brought before a staff officer for interrogation.

"How many of you Yankees are there in France already?" the German asked.

"Oh, about three millions," the American replied, nonchalantly.

"Three millions! Impossible! According to our precise information, there are not enough ships to carry across that many troops, even if they could get through our submarine blockade." The German was astounded.

"Oh, yes, we have ships enough. In fact, only one ship was necessary to get us all across."

"One ship enough! Absurd! What ship was that?"

"The Lusitania."

It was indeed that one ship, and the long train of submarine controversy which followed its destruction, that brought the United States into the war and our boys to France. Let no American fool himself into believing that our Government went to war for any other reason than the murder of our citizens on the high seas in the most wanton violation of international law. If it had not been for the submarine outrages we would not have joined the Allies, and Germany would have won the war. Let any one who will not believe this read the revealing letters of Franklin Lane on President Wilson's Cabinet meetings or the London letters of Walter H. Page.

THE RIGHTEOUSNESS OF AMERICAN CLAIMS

The one ship brought three million American troops into the war and changed the destiny of humanity. That the cause for which these men fought was righteous no one in America will now deny. If so righteous, it follows that this Government has morally obligated itself to secure proper indemnification for the outrages to neutral American citizens whose assault and assassination brought this country into the war. Our Government owes it to its self-respect and honor to see that the families and dependents of the scores of these citizens shall be indemnified at the expense of Germany. It owes it to its self-respect and honor that American citizens surviving those horrors with crippled bodies shall be indemnified for their suffering as far as material compensation can help restore them to health and happiness. The United States in all its history has had no more righteous nor more universally acknowledged claims than these against a foreign Power. It is to the honor of both our

great political parties that they have shown a determination to secure for our victims of German piracy the reparation they deserve.

AN ORGANIZED PROPAGANDA TO FORGET

Very curiously, there is developing an organized opinion that is already trying to make us forget the Lusitania. It would leave to shift for themselves these Americans who had the temerity to travel, in full protection of their Government and with its passports, on Allied passenger ships during the war. This sort of organized propaganda would forget altogether our fellow-citizens killed or crippled on the Lusitania, Sussex, and other Allied passenger boats and on American merchant ships during the period of our neutrality. In the case of Swiss and Spanish subjects who were injured or who lost their lives in the torpedoing of the cross-Channel passenger packet Sussex in 1916, Germany made prompt indemnification. She also offered to indemnify the United States for the Lusitania and Sussex horrors. We correctly refused to accept mere money compensation for such shameless insult. We insisted on absolute and final rejection of the principle of ruthless submarine warfare before discussing material reparation. We insisted, ultimately, on extinguishing by armed force that vicious principle. Now that the principle itself has been attended to in the only possible way, the claims of these Americans may be considered. But, we repeat, there are fellow-countrymen who would forget the Lusitania—at least the American victims murdered on it in the most spectacular assault against civilization that modern times have witnessed.

Before the writer is a little circular put into wide distribution among American educators, writers, students, and clergymen by an association whose general purpose is a liberalization and definition of American foreign policy. The circular is entitled "Return *All* the Alien Property." It refers to property of German, Austrian, and Hungarian owners sequestered—not confiscated—during the war by the United States, after act of Congress, and now held for eventual disposition in the hands of the Alien Property Custodian. It is this property alone which can be available to satisfy the claims of our citizens or the dependents who survive them, claims so just as to have justified a war.

It is useless to speak of collecting anything from Germany unless out of this sequestered property. This can easily and honorably be done, and Germany be left to indemnify in such way as she can the German owners of that property. The same is true as to Austria and Hun-

gary, if we choose, although this article applies specifically to Germany. All that Germany has now is mortgaged to the European Allies by the Treaty of Versailles. The property now held in trust by the United States amounts to something considerably over \$600,000,000, ample to satisfy the claims of which we write. What is left may be returned to the German Government. But we should remember right here that a bird in the hand is worth two in the bush. Also that an American dollar at this writing is worth anywhere between four hundred and five hundred marks. The history of the Boxer indemnity shows that the United States, the only Power to return to China any surplus out of the round sum collected, may be trusted to do justice to Germany with what is left after securing to our own citizens the justice so ruthlessly trampled on from 1914 to 1917.

PRIVATE PROPERTY IN WAR TIME

The argument for the immediate return of "*all* the alien property"—the word "*all*" has been used and italicized because of reports that the Government had proposed to return properties of value of less than \$10,000—is the more plausible because it purports to be based on international law. It is the more indefensible because it is put forth to liberal-minded Americans by an organization whose directors are students of international law and who have, perhaps unconsciously, failed to give the law of nations fair examination in this particular instance. Above all, they have not made their brief fair to the American citizens murdered on the Lusitania. Their argument runs in favor of Germany and against the justice of requiring payment for the American claims out of the sequestered property and leaving to Germany the obligation to restore to her citizens the property which she will have agreed to divert to our purpose. The argument is not only not patriotic, but not just.

They contend as follows. Heretofore the United States has always insisted on the sanctity and security of private property of enemy aliens in time of war. This procedure "embodies what has since 1793 been deemed a fixed rule of international law and has been considered unassailable. Whatever path other nations may choose to follow, we at least have an honorable tradition to maintain in this matter, fortified by our treaties, by international law, and by the promises expressly made when Congress adopted the policy of sequestration." It is asserted that the argument that this sequestered property should be held as security to satisfy claims due American citizens strikes at the root of the in-

violability of private property in time of war, "for to use private property to pay governmental obligations is merely a method of confiscating it in whole or in part." Anyway, it is held, the claims of American citizens will probably be reduced to a sum not exceeding \$25,000,000 (this statement despite press reports that the State Department has totaled the American claims, filed under oath, at several hundred million dollars). Therefore all this sequestered property should not be held as security for the just claims of Americans slain and mangled by German torpedoes, but should all of it be immediately returned to its alien owners. It is needless to add that thereupon it will be taken over by the Allies to satisfy the unextinguished claims of their subjects.

The question thus is one whether the claims of killed and injured Americans, the victims of these outrages during the period of our neutrality, should be relinquished—after the United States has made victory possible and has demanded no war indemnity nor cessions nor reward of any kind—to help satisfy Germany's European creditors. It is argued that it is illegal or dishonorable, or both, for the United States to hold this sequestered property against satisfaction of our just claims.

Now, as a matter of reality, it is neither illegal nor dishonorable to hold this property until our claims are satisfied. And it is obvious that these claims actually can be satisfied in no other way. An attentive examination of the treaties between the United States and Germany and of the relevant principles of international law, simple enough for everybody to understand, will show that our hands are in no danger of being tainted.

Even immunity from absolute confiscation—remember it is only temporary sequestration with which we need actually be concerned here—has by no means been a universally acknowledged principle of international law. One of the standard treatises on international law before the war was Hall, who declares as follows on confiscation:

Upon the whole, . . . although the seizure by a belligerent of property within his jurisdiction would be entirely opposed to the drift of modern opinion and practice, the contrary usage, so far as personal property is concerned, was until lately too partial in its application, and has covered a larger field for too short a time to enable appropriation to be forbidden on the ground of custom as a matter of strict law; and as it is sanctioned by the general legal rule, a special rule of immunity cannot be established by custom alone. For the present, therefore, it cannot be said that a belligerent does a distinctly illegal act in confiscating such personal property of his enemies existing within his jurisdiction as is not secured upon the public faith; but the absence of any instance of confiscation in the more recent European wars [i. e., since the Napoleonic wars], no less than the common in-

terest of all nations and present [1889] feeling, warrant a confident hope that the *dying right*¹ will never again be put in force, and that it will soon be wholly extinguished by disuse.

It has been the tendency of some writers after Hall to consider the decrease of that "dying right" of confiscation (not the milder procedure of temporary sequestration) to have occurred already, although there had been since Hall's time no European war of sufficient consequence to test the strength of the increasing desire for such immunity. Thus, for example, the distinguished American publicist, Hershey, writing in 1912, regarded the confiscation of private alien enemy property as entirely obsolete in practice. He was speaking of course of confiscation, not of sequestration.

THE DIFFERENCE BETWEEN CONFISCATION AND SEQUESTRATION

Two years after Hershey's book was published the European War broke out, and the immunity of private property could not stand the strain. It was to the interest of Germany to secure the general adoption of that principle, just as it was for her interest, in the face of British sea power, to secure the general adoption of the Declaration of London and, if possible, the immunity of private property at sea. This was simply because of the great amount of German investments abroad. Germany would have had far more to gain than to lose by establishing the immunity of private property. Not so with France and England, which speedily sequestered German-owned property located within their territory. In protest and retaliation, Germany did the same to French and British property in Germany. Later Great Britain proceeded to sell all sequestered German property located in her territory and to wind up German-owned business concerns, holding the liquidated proceeds against the terms of peace. France did not ordinarily sell the alien enemy property. She was content to administer it during the war. Following the British practice of liquidating enemy-owned property, the same procedure was put into force by Germany against British-owned property. In innocent Belgium, where no cause for retaliation should have existed, the property of alien enemies was placed under German administration, except in the case of British-owned property, which was promptly liquidated. As is well known, the Treaty of Versailles settled the question of the eventual disposition of this sequestered property, not by confiscating it, but by crediting it to Germany's reparations account. By the terms of the Treaty, Germany took over the responsibility of indemnifying her subjects for property over which they had thus by the action of their Government lost title.

¹ Italics inserted.

When the United States entered the war, the right of sequestration was thus in full practice by the chief nations of the world. There had been no actual confiscation, nor technically has there been confiscation since that time. In fact, there is no occasion to use the word confiscation at all here. We are dealing rather with sequestration, a milder procedure which recognizes the title of the property to be held in trust for the owner. The practice of the United States, however, had been to favor the complete immunity of alien-enemy-owned private property, just as we had consistently voiced our desires to see accomplished the complete immunity of private property at sea. We actually wrote an anti-sequestration guaranty into our first commercial treaty with England, at England's strong insistence, because of the enormous amount of British-owned property then existing here, concerning which sequestration had been recently threatened by Congress. That treaty applied to the War of 1812 in so far as this provision is concerned. During that war the Supreme Court of the United States held that *confiscation* could not take place without a special act of Congress. Since the War of 1812 we have not been engaged in a war in which the question of enemy-owned property existed in magnitude enough to be of vital importance. When we went to war with Germany, we stood confronted with the existence of a great amount of enemy-owned property within our confines and the widespread European practice of sequestration. To allow that enemy property to continue in its existing shape would actually have weakened the military strength of the Nation. For example, if we had not taken over the German privately owned ships in American harbors, if we had recognized the absolute sanctity of private alien property in that instance and had forborne to use these ships for transports, Germany might have won the war, and there would be no question of sequestered German property vexing a few good people to-day in our land. They would be annoyed, instead, by the difficulties of meeting staggering taxes to pay Germany's war expenses. It is interesting to note in this connection that the clamor against sequestration has not been very audible in the case of the ships taken into custody and used for transports during the war. In regard to the other German-owned property sequestered and later sold, the proceeds were largely invested in Liberty Bonds, which are now held in trust by the custodian—instruments which proved almost as helpful in winning the war as the ships we were lucky enough to find in our harbors.

Considering that there was no express prohibition of international law against sequestration, nor even any certainty in the case of actual confiscation, and considering the widespread practice of European nations, among them our

enemy, the American procedure of taking custody of alien property in this country and putting it into such shape as was most useful for victory is nothing which can be held to tarnish the honor of our country. All this is written in the assumption that Germany and her allies had not already committed against us hideous violations of international law such as to justify not only this calm sequestration but retaliatory measures of the most severe and unmistakable nature. Understand that we have been discussing the question only from the technical point of view, as if the decks of passenger ships had not already been made slippery with American blood and as if no American woman or child had been done to her death by a German *Schwarzkopf*.

OUR TREATY OBLIGATIONS OBSERVED

It remains to see whether in our sequestration of German-owned property we have violated any treaty obligations. The only treaty provision which applies is Article XXIII of the Treaty of Amity and Commerce between the United States and Prussia of 1799. This article repeats the terms of the same article in the treaty of 1785, and was reincorporated in the Treaty of Commerce and Navigation of 1828, which continued legally to govern relations between the United States until the outbreak of the war in 1917. The article stipulates:

If war should arise between the two contracting parties, the merchants of either country then residing in the other shall be allowed to remain nine months to collect their debts and settle their affairs, and may depart freely, carrying off all their effects without molestation or hindrance. And all women and children, scholars of every faculty, cultivators of the earth, artisans, manufacturers, and fishermen, unarmed and inhabiting unfortified towns, villages, or places, and in general all others whose occupations are for the common subsistence and benefit of mankind, shall be allowed to continue their respective employments, and shall not be molested in their persons, nor shall their houses or goods be burnt or otherwise destroyed, nor their fields wasted by the armed force of the enemy, into whose power by the events of war they may happen to fall; but if anything is necessary to be taken from them for the use of such armed force, the same shall be paid for at a reasonable price.

With this article in mind, let us examine American treatment of enemy-owned property.

The procedure was determined by the Trading-with-the-Enemy Act of October 6, 1917. An admirable summary of that act and procedure under it may be found written by the eminent authority on international law, Professor James W. Garner, in the "American Journal of International Law" for 1918, also summarized in the same writer's "International Law and the World War" (1920). The act provided for appointment by the

President of an Alien Property Custodian with power to receive all money or property due or belonging to an enemy or enemy ally subject which might be delivered or conveyed to him, and, under the direction of the President, to hold and administer the same. All corporations, associations, and trustees with shares owned by enemy aliens were required to make manifest the amount and location of enemy alien ownership. All debts owed to alien enemies or property due them, not otherwise expressly provided for by license, was to be delivered to the Custodian. These last-mentioned funds were then to be invested in United States bonds. All other property held by the Custodian was to be "safely held and administered" by him. According to Professor Garner, the sale of enemy property does not appear to have been authorized by the Trading-with-the-Enemy Act further than was necessary to protect that property against waste and to preserve the interests of the United States in the same. But by a clause in the Urgency Deficiency Bill of March 28, 1918, the Custodian was given general power to sell to American citizens any property in his possession; and by an executive order of April 2, 1918, sales were commenced. "The avowed purpose of this measure . . . was to destroy the enormous financial power which had been built up in the United States by persons resident in Germany," and to root out German influence." The proceeds of sales of course were not confiscated by the Government, but retained—sequestered—in its safe possession until a proper occasion should come for adjustment of the several difficulties with Germany. It is this money which is still in the possession of the Alien Property Custodian, and which some few people would not like to see returned immediately and without condition to Germany.

The question arises, Was this sequestration a violation of the Treaty of 1799, above quoted? On this the authority of Professor Garner is quite clear:

This treaty stipulation was, however, clearly inapplicable to property owned in the United States by persons residing or domiciled in Germany. It evidently had in mind the protection of peaceable non-combatant enemy aliens who remained in the United States after the outbreak of war, and not those who were abroad and engaged in carrying on war against the United States. . . .

It does in fact not appear that the property of any German subject residing in the United States not actually engaged in making war against the United States and not interned, was seized or sold. Seizures and sales were in the main limited to property owned, not by enemy aliens residing or domiciled in the enemy country and embracing such persons as the Emperor, the late Chancellor Bethmann Hollweg, and many capitalists belonging to the ruling class who held enormous property interests

¹ Italics inserted.

in the United States and who were actually engaged in making war against the Government and people of the United States.

Only in case restitution of this property is not contemplated can it be regarded as confiscation, opines Mr. Garner, not without noting the Senate debates which maintained that confiscation would be just reprisal for Germany's conduct in destroying the lives and property of American citizens on the high seas. He continues:

Apparently it was the intention of Congress that the whole question of restitution should be left for determination by the treaty of peace at the conclusion of the war, the idea being that a claim would be presented to Germany for damages on account of the unlawful destruction of American lives and property at sea by the German naval forces, and a balance struck between the amount so claimed and the amount of the proceeds derived from the sale of German-owned property in the United States. On this assumption, the seizure and sale of German-owned property in the United States by the American Government, severe and unprecedented as it may seem, can be justly defended.

It is not necessary to contrast the weight of authority behind these words with that on which rests the unsigned text of a well-meaning but uninformed liberal association which purports to give advice to Mr. Hughes in the disposition of the foreign affairs of the country. One might be tempted nevertheless to note that the same association which stands here, after its own logic, for the sanctity of private property is at present conducting a campaign for the recognition by the United States of the Russian Soviet Republic, which has arrogantly and persistently refused to restore private property of any kind, alien or domestic, confiscated in 1917.

The final assertion against retention of this sequestered property as security for claims is that it is contrary to "promises expressly made when Congress adopted the policy of sequestration." As to this assertion, it is enough to say that it is wrong in fact. A reading of the acts in question shows no such promise, nor does a reference to the United States Statutes at large and the "Congressional Record" for the period of the war.

GERMANY'S OWN VIOLATIONS OF THE TREATY

Before losing sight of the treaty of 1828 with Prussia, we should notice certain other articles applicable to the treatment of the United States as a neutral by Germany, a belligerent. Article XII of the treaty declares:

If one of the contracting parties should be engaged in war with any other Power, the free intercourse and commerce of the subjects or citizens of the party remaining neutral with the belligerent Powers shall not be interrupted. On the contrary, in that

case, as in full peace, the vessels of the neutral party may navigate freely to and from the ports and on the coasts of the belligerent parties, free vessels making free goods.

The treaty further provides that in case a strictly specified list of commodities shall be subject to detention as contraband they shall never be confiscated as such, but full indemnity for their actual value shall be paid the owners, although the goods fall within the enumerated category of contraband.

Contrast with this treaty the German submarine blockade of England and its application to American shipping. Contrast the ruthless submarine warfare—not anticipated by any treaty, it is true, but as rank piracy beyond the pale of civilized warfare and international law—with the loyal observance by the

United States of the terms of the old Prussian treaties. It is both silly and wrong to maintain that the conduct of the United States toward alien-owned property during the recent war has been anything but honorable and fair. We have pursued the path of "proud punctilio," and that in the face of shameless violation by Germany of international law in its universally recognized definitions and of her very treaty obligations with the United States.

THE JOINT CLAIMS COMMISSION

It would not be even necessary to subject the matter of these claims to a German-American joint commission. The United States is perfectly competent, and the history of the Chinese Boxer indemnity shows that it is able honorably and justly to settle them without

reference to German assistance. But to avoid any accusation by Germany of "veiled confiscation" a joint claims commission can be set up by agreement between the two Governments, with the understanding written into the convention that all sums awarded to American claimants be paid out of the German property now in sequestration, the balance of which shall then be promptly returned to Germany. That is what appears to be the policy of the Department of State. Surely there is nothing unfair or dishonorable about this procedure, nor anything wrong in holding the property in sequestration until Germany is willing to agree to such a settlement of claims the justice of which she had expressly acknowledged before she finally forced us into war.

Let us not forget the Lusitania!

VICTOR. EMMANUEL III

EDITORIAL CORRESPONDENCE FROM ITALY

BY ELBERT FRANCIS BALDWIN

NEVER have I met a simpler, more unaffected, more intelligent man.

Simplicity was in refreshing contrast to the stiff salutes from the many gorgeously uniformed military men as I entered the palace, crossed a great court, and ascended a long, spacious stairway leading to splendidly decorated rooms. In the last of them was Duke Borea d'Olmo, Royal Master of Ceremonies, with whom I conversed for a few moments. Then a door at the other end of the room was opened, and another official appeared and shook hands with me. Both then took their positions on either side of the door and, standing at attention, invited me to pass through.

I entered the throne room. I looked towards the other end, where I expected to see the monarch sitting in state, when, lo! close to the entrance a small, friendly-looking person was smiling, extending his hand, and saying in English, "I am very glad to see you, Mr. Baldwin."

Before I could recover from my surprise he had escorted me across the room to a sofa, on which he ensconced himself in true Rooseveltian fashion, indicating at his side a table for my "topper" and an armchair for myself. In the same way, later, when he gave me his hand in good-by, indicating that the audience was at an end (I had of course to wait for the royal signal before rising), he accompanied me across the room to the door, thus thoughtfully saving me the otherwise necessary backing out and the three customary bows, and also saving himself the furniture I surely would have backed into on my way out.

I had come for a supposedly three-minute formality. The King kindly kept me half an hour.

THE KING AND QUEEN OF ITALY VISITING TRIESTE

The Queen is kissing a little Yugoslav child, a representative of the race which occupies Trieste in conjunction with the new Italian rulers of the city

The American Forestry Association had requested me to inform his Majesty of its gift to Italy of five million Douglas fir seeds. From what the King told me, I felt surer than ever that the gift would be appreciated here.

I did not have to tell him what the American Forestry Association was any more than what The Outlook was. His knowledge of men and things is simply omnifarious.

Speaking of The Outlook, he inquired

Keystone

KING VICTOR EMMANUEL III OF ITALY

"King Humbert gave his son a Spartan education in every way. You read the result in the strong lines of the present King's face"

how long I had been on its editorial staff.

I replied: "Thirty years."

He answered: "You must have begun young."

"No, your Majesty."

"Why, how old are you?"

When I told him, he said: "I supposed we were about the same age."

He knows how to hand out a compliment.

In connection with The Outlook, we spoke of Theodore Roosevelt. "What a pity such a man could not have been

spared!" remarked the King, and then made me tell him about the Brazilian expedition. "He seemed so young when he was here," his Majesty added, "it is difficult to realize that he is gone."

We talked of various events. The Facta Ministry had fallen the night before, and I thanked the King for receiving me at a moment when his engagements were presumably pressing.

Not once did I have to take recourse to Italian or French. His Majesty speaks English not only with easy

fluency but, strange as it may seem, without foreign accent.

Victor Emmanuel's portraits do not do him justice. In the first place, he is maturer, not to say older looking. In the second place, his face is finer and more winsome. In face, as in mind, he is ahead of his father, Humbert I, and his grandfather, Victor Emmanuel II.

King Humbert gave his son a Spartan education in every way. You read the result in the strong lines of the present King's face, as in the marvelous range and accuracy of his information. His physician said to me the other day: "Tap his Majesty on any subject, and you will get, not only a ready response—you may find that in some things he is unusually erudite." Such proved to be my experience.

His manner unites his father's force and his mother's grace. Yet there is a wistful something about the manner, as of one who, though happy because of many blessings, had long since found one fundamental blessing withheld and would know the reason why—a blessing more essential to a king than to a commoner.

As I sat there I could not help thinking of my earlier visits to Rome, when I saw the King, then a little boy, driving with his tutor. Like every one else, I admired the boy's mother, Margaret of Savoy, and used to go frequently to the Pincio, where she drove daily, to get a sight of her lovely face and gracious manner. Once I had a bow from her all to myself, and that was a red-letter day for me.

Now the boy has become the man. His closely cropped hair is graying fast. His prominent mustache does not altogether hide the lines of his fine mouth. His clear eyes are at once piercing and all-embracing; they are kindly, but they show that he cherishes no illusions. Unlike most Italians, as he talks he makes few gestures.

A conscientious and a really powerful ruler, Victor Emmanuel is first, last, and all the time a domestic man. Some people complain that the King and the Queen do not show themselves enough in public. They are not always on dress parade, it is true, but they show themselves conscientiously and sufficiently. What is more necessary for Italy or for any other country, they show themselves models of family devotion. Years ago the royal physician—as he himself told me—happened in at the palace nursery, and found the King, Queen, and their children all on the floor playing mumbletypeg.

A few hours after my audience to-day I saw an old Roman friend who visits the King frequently. "The next time you have an audience with his Majesty," remarked my friend, "ask if you may not bring one of your sons along with you, should the occasion permit. The King takes a great interest in young men. He has a fine boy of his own."

Rome, July 20, 1922.

THREE POEMS BY CHANG HU

TRANSLATED BY WITTER BYNNER AND KIANG KANG-HU

AN OLD SONG

THREE thousand li from her native land
And twenty years in the depths of the palace,
To-day, at the end of a single stave,
She cannot hide her tears from you.

ON THE TERRACE OF ASSEMBLED ANGELS

SUNLIGHT slants on a stately roof, Branches present their red blossoms for dew . . . Last night the Emperor made a new choice— Ever-True's bright smile parts the curtains.	The Emperor favors Lady Kuo Kuo. In the morning, approaching the palace gate, riding, Contemptuous of paint as a blemish on beauty, To meet him she smooths her two moth-tiny eyebrows.

AT CHIN-LING FERRY

IN the one-story inn at Chin-ling Ferry
Even a night is enough misfortune,
But down the dead moon's ebbing tide
Beckon the twinklings of Kua-chou.

THE NEW GUARD AT THE PUBLIC PURSE

SPECIAL CORRESPONDENCE FROM WASHINGTON

BY WILLIAM P. HELM, JR.

THE Federal Government spends, year in and year out, about \$100,000 every working hour for transportation of its property and employees. Nearly every dollar of this money is spent wisely and judiciously, but once in a while there is a slip and a few dollars are spent unnecessarily. When such slips occur, they are investigated, safeguards against their repetition are erected, and the Government profits in the long run through changes which would not have been adopted otherwise.

A case in point is the recent shipment of a human skeleton. It was sent with a miscellaneous lot of hospital supplies—food, containers, laundry-bags, instrument tables, and bed screens—from one institution to another. With the exception of the skeleton, the shipment, which weighed 13,600 pounds, was subject to a low freight rate. The freight rate on the skeleton, however, was three times the first-class rate.

As the car containing the goods was sealed and the weights of the various items were not listed separately, the entire shipment moved at the skeleton rate. Moreover, railway regulations prescribe 20,000 pounds as a minimum carload, so the freight charge was based on that weight. Because of these circumstances, the Government paid about five times as much freight on the shipment as it should have paid.

The high charges on the shipment did

not escape the eye of an official recently assigned to the task of saving money for the Government in the item of its transportation charges. He investigated, found that the railway was clearly within its rights, ordered the bill paid and the system changed. No Government laundry-bags will travel hereafter at three times the first-class rate.

The change was made through the vigilance of the Government's newest major agency, the Bureau of the Budget. That agency has been functioning smoothly and quietly for about a year. It employs no press agent; it does not work in the newspapers, so little is read about its activities. Its duties consist of nothing more or less than saving money for the taxpayers.

It saves money in hundreds of big and little instances, all of which come under two headings: First, economy in planning for future expenses; and, second, economy in spending funds already appropriated. Its work is so big and broad and with so many ramifications and the economies it has already achieved are so richly studded with striking illustrations that it is difficult in a short article to portray even its high lights. Its scope and accomplishments are measured in savings of hundreds of millions of public funds and in a spirit of economy that is spreading, like leaven, through every executive branch of the Federal Government, clear down the line to the humblest employee.

It is little more than a year since Congress enacted the Budget Law. Under that law the executive branch of the Government is required to plan appropriations for a year ahead, in detail, and submit the estimates to the Director of the Budget, who holds over them the power of veto. The Director of the Budget has exercised his prerogatives to such good effect that Government expenditures during the present fiscal year are many millions below what they would be without such a check.

Bureau after bureau has sent its estimate to the Director of the Budget, to have it slashed in its non-essentials; to have cherished plans of increased Governmental activity—and expense—eliminated; to have pet projects thrown into the discard. Bureau chieftains have finally realized that a new day has come in spending public funds and that there is a new and effective check to boundless expansion of Governmental domain. It has been a shock to these well-meaning and highly efficient gentlemen, the like of which they have never had before.

In justice to these able public servants, it should be clearly pointed out that they have been trained for generations to consider the end to be accomplished as of prime importance and the cost secondary. With this lifetime training become set in the hard mold of habit, there is little wonder that they are wrenched in adjusting their affairs

(C) Harris & Ewing

FORMER BRIGADIER-
GENERAL H. M. LORD,
THE NEW DIRECTOR OF
THE BUDGET,
Succeeding General Dawes

to the new rule that the cost comes first and, with certain notable exceptions, the end to be accomplished second.

They are learning, however, thanks to the deft guiding of the first Director of the Budget, General Charles G. Dawes, and to his resourceful and energetic successor, General H. M. Lord. The first of these gentlemen taught official Washington the new rules of the game; the second is training it to team-work and perfection in its play. The first, because of his vigorous testimony before a Congressional investigating committee, has been profanely dubbed "Hell-and-Maria" Dawes; the second, from his own slogan, "Economy with Efficiency," is growing into the characterization of "Economy" Lord.

Dawes, first in the new field, accomplished the spectacular; Lord, his successor, is carrying on and, in addition, is putting into effect some highly meritorious and efficient ideas of his own. He realizes, in his own language, that "we must sell the budget every day to the American people," and he is seeking every day of his interesting official life to perfect his salesmanship.

The Director of the Budget is the personal agent of the President. The President has clothed him, by virtue of the Budget Law, with extraordinary powers. He has the dictum in affairs of finance over the rulings of members of the Cabinet. Subject only to the President's approval, his word is law as to what ex-

penditures shall be recommended to Congress and what shall not for every bureau, board, commission, and department of the Federal Government.

Clothed with these ample powers, the Director of the Budget has made intensive study of Government expenditures.

One of the first things investigated by the Budget Bureau was the business of buying. It uncovered some amazing things. It found that in the Treasury Department alone, for instance, there were twenty-six separate and independent purchasing agencies, each buying supplies. Imagine a great business organization with twenty-six unrelated purchasing agents! That was changed of course; the Treasury now has one purchasing agency. The Department of Commerce had sixteen such agencies; there now is one. And so that phase of the work is progressing through the entire fabric of the Government. The savings, naturally, are enormous.

The Budget Bureau also found that certain Governmental agencies, notably the Army, the Navy, and the Shipping Board, had on hand billions of dollars in surplus supplies. Investigation disclosed also that other Government agencies needed the very articles, in many instances, which were classed as surplus. Here was an opportunity for one branch of the Government to sell, at sheriff sale figures, supplies which other branches of the Government were buying at market prices.

That, too, was changed. Now there is a clearing-house for all Government requirements. When a department needs supplies, its requisition must go to the clearing-house. If another department has them on hand as surplus, an exchange is made, with resultant saving. Not until investigation has shown that the required supplies are not on hand as surplus in the Government's possession is the department making the requisition allowed to purchase them.

That system saves money. Here is one instance:

The Navy needed twenty-nine vessels—cargo steamers, tankers, etc.—to replace worn-out auxiliary craft. Under the old way of doing things, it would have advertised for them. Under the new way, it got them from the Shipping Board, which had the vessels tied up and was paying out money to keep them properly conditioned and under guard. The savings to the public in that item alone exceeded \$17,000,000.

Take another case. Taxicabs were required for the use of foreign delegations at the Arms Conference, and the United States Government, as host, sought to provide them. It offered to make a contract with a private taxicab company at Washington, but the price named by the company was considered too high. Through the Bureau of the Budget an arrangement was made to use the War Department's excess passenger automobiles, much more commodious and comfortable than private taxicabs, and \$20,000 was thereby saved to the taxpaying public.

One more illustration. The Post Office Department sought to obtain extra trucks to move the flood of Christmas mail. Four hundred War Department vehicles were pressed into service throughout the country, and the saving therefrom totaled approximately \$50,000.

Such co-ordination in purchasing was unknown before the enactment of the Budget Law.

In the field of transportation a Federal Traffic Board was installed to effect economy. An Advisory Committee composed of Mr. Lewis J. Spence, Director of Traffic, Southern Railway; Mr. George H. Ingalls, Vice-President of the New York Central Lines; Mr. Lincoln Green, Vice-President of the Southern Railway System; Mr. H. M. Adams, Vice-President of the Union Pacific System; and Mr. Archibald Fries, Vice-President of the Baltimore and Ohio Railroad, was named to assist. These gentlemen, serving without pay under the chairmanship of Mr. Ralph C. Caples, an experienced traffic man, have aided and are aiding the Government in its new work under the Budget Bureau.

As expected, the Board is saving public money. An economy of \$220,000 was effected in five months by the shipment of Government property by rail and water instead of all rail. A fifty per cent cut in rates (from \$2.50 to \$1.25 per hundred pounds) has been obtained on all water shipments of Government

property, a big item, from coast to coast. This in addition to the \$220,000 cited above. Within six months, it is estimated, the total savings brought about through the Federal Traffic Board have been not less than \$1,250,000. And, in addition, the Board has laid down regulations which will perpetuate this saving annually to an equal or greater sum.

Other great subdivisions of the Bureau of the Budget have been built up and are to-day in effective, though little heard of, operation. Here are a few illustrations of savings not only directly attributable to the Bureau of the Budget, but brought about solely by the Bureau's initiative:

Prohibition officials used to rent private warehouses in Brooklyn, Philadelphia, Baltimore, Boston, Chicago, and other large cities for the purpose of storing their seized contraband. Space that was unused in Government warehouses is now used for that purpose, at an annual saving of \$80,000 in rent.

Three hundred Marines guard the mails in New York City. They were housed at the Brooklyn Y. M. C. A. building and were receiving commutation of rations. The Bureau of the Budget found space for them on an unoccupied Shipping Board pier at Hoboken, with a resultant saving to the Government of \$300 a day, or more than \$100,000 a year.

A transfer of fire extinguishers listed as surplus by the War Department was effected to various other departments.

On the market the extinguishers were priced at \$10.50 each, as compared with \$4.75 paid by the War Department. The savings on that transaction were about \$21,000.

The Chicago Postmaster was furnished surplus coal at a saving of more than \$8,000; the Marine Corps was enabled to effect a \$24,000 saving in obtaining cotton undershirts from the War Department; a saving of \$120,000 a year in the upkeep of a cable ship was effected through a transfer; and the Labor Department saved more than \$5,000 in a little deal involving the purchase of blankets.

These are some of the ways—a handful drawn for purposes of illustration from thousands—in which the Bureau of the Budget is operating to save money for the American taxpayer.

Just now the Bureau is engaged in the task of paring down the estimates of Government officials as to what they will need to keep their various enterprises going during the coming fiscal year. That part of the work is not spectacular; it is not calculated to make friends for the Director of the Budget; it is not altogether pleasant. It is a hard thing for a man to cut into another man's ambitions, especially if the other man happens to be a personal friend. But that is what Director Lord is having to do to-day, and will have to do to-morrow, and will continue doing until he sends the completed product to the President for transmission to Congress.

General Lord is one of the most popular of army officers. He has spent considerable time in high service with the War Department at Washington. His previous work had to do almost wholly with War Department finances, of which he was in charge. He established a record for efficiency there which has not been eclipsed. Under his administration of its funds the Department came through the last fiscal year without a single deficiency bill. He is trying now to apply that measure of success, so far as it can be applied, to the entire organization of the executive branch of the Government.

He has already received preliminary estimates of next year's requirements from the various departments. Under the law, he will receive final estimates not later than September 15. It will be his task to cut them approximately \$600,000,000 to bring about a reduction in the cost of government and hold total expenditures to the limit of total anticipated receipts.

"Our country," said President Harding the other day in addressing a meeting over which General Lord presided, "is one of the few in the world which is now paying its way as it goes, and I must regard with disfavor any tendency to interfere with this condition or to increase taxes."

"Mr. President," said General Lord in response, "we guarantee new and signal triumphs in the field of governmental economy with efficiency."

CLOSE-TO-HOME MOUNTAIN CLIMBING

BY ELON JESSUP

AN outdoor activity which demands varying degrees of specialized knowledge on how to walk, creep, writhe, and in certain instances almost hang on by your finger-tips has become extremely popular within recent years. To-day is the heyday of mountain climbing. In the White Mountains of New Hampshire, Rockies of Colorado, Sierras of California—almost any mountain or hill locality, in fact—one finds all ages and both sexes turned mountaineer, youngsters as well as grown folk scaling towering peaks.

This general popularity of mountain climbing is gratifying to any one who likes to see the outdoors made the most of. It is a recreation which is good for the soul and good for the body. A Swiss guide once remarked: "I have no evil thoughts when I am climbing a mountain."

Which sums up with engaging simplicity one side of this excellent sport. The present article, however, is mainly concerned with physical aspects. The good works of mountain climbing are numerous in this respect. With practice, mountaineering develops nimbleness and all-around strength of body,

strong lung power, fine sense of balance, caution, teaches one properly to preserve energy and how to keep one's nerves under control. The game gives and demands all-around development rather than specialized muscular development.

Next Week

in The Outlook for September 6 will begin

"Under Four Presidents"

The Autobiography of

Oscar S. Straus

Unfortunately, mountain climbing in its present-day popular phase is too often accompanied by high spirits run wild without thought of caution or result. The rules of the game receive an insufficient amount of attention. The exhilarating combination of expanding lungs and hungry imagination now and again blinds one to important practical details. There is a temptation both to overdo and take foolhardy chances, although of course one is not always conscious of running these chances. The experienced mountaineer never, if he can possibly help it, does either. He plays safe.

Mountain climbing is, or should be, considerably more than a haphazard scramble. Some people are born climbers, but, as a rule, the game must be learned in the mill of experience. And it does not make a vast amount of difference where one learns, for the fundamental principles of mountaineering hold good the world over.

The snow-fields and glaciers of the Alps, Canadian Rockies, and Himalayas of course demand a specialized knowledge of snowcraft which is hardly necessary in regions such as the Adirondacks

CLIMBING MOUNT SIR DONALD, SELKIRKS, CANADA

and the White Mountains. Snowcraft is a big subject in itself. Yet the fundamental elements of caution, knowledge of natural conditions, and conservation of physical energy are about as essential in one place as another. A fall of fifty feet from the Hudson River Palisades may prove just as fatal as a fall of three thousand feet in the Rockies, a landslide in the White Mountains may be more disastrous than a snowslide in the Alps.

One of the first rules of mountain climbing is that of learning the game by easy stages. I know a girls' camp located in the New Hampshire hills from which every so often during the course of the summer a party of about fifteen girls ranging from eight to thirteen

years of age are taken on a four days' climb among the peaks of the White Mountains. They all look forward to this climb as the big event of the summer.

None of the girls, however, is allowed to go until she is in fit physical trim and has set her mind and feet to work learning the fundamentals of mountain climbing in the low foothills close by the camp. She is put through a thorough course of sprouts which will make her feel at home in bigger hill company.

This system is excellent in every respect and fully as applicable to grown-up climbing beginners as it is to children. And with the widening of one's climbing experience, say from the White Moun-

tains to the Rockies, it still holds good. Every mountain range has individual characteristics, and these should be learned under tolerably safe conditions. If your fancy turns to snow-mantled peaks of the Canadian Rockies, learn your mountains and the specialized methods of climbing which these demand on reasonably low and easy peaks of this section before tackling high and difficult monarchs. There are few experiences more terrible than those of becoming physically exhausted and losing one's nerve in a dangerous mountain spot.

The present article is confined for the most part to what might be termed close-to-home mountaineering, meaning thereby that it deals with climbing methods which may be practiced in varying degrees in almost any mountain or hill section on this continent, from the Ramapo Hills to the Canadian Rockies. Snow and ice climbing methods are omitted, for the reason that these are found only in certain regions. Close-to-home mountaineering is far more general than alpine mountaineering.

The two outstanding dangers in almost any sort of climbing are accident and physical strain. The average climber is not so liable to the former as he is to the latter. Even a fairly steep foothill is a strain upon human powers, and while mounting its slope your strength is being pitted against one of nature's greatest forces.

It is only when this strain is reduced to its minimum that you have the proper kind of climbing. Which for the most part means being in fit physical trim before tackling a mountain and knowing how to preserve one's energy on the way up. A ten-year-old boy, for example, is likely to be endowed with a greater supply of spirits than wise judgment, and for this reason will stand watching and advice. By all means encourage his mountain-climbing ambitions, but teach him how to climb. And in all instances give due consideration to the condition of the heart and lungs, for the strain upon these organs is great.

Methods of getting to the top of a mountain or hill vary with local conditions, but whether you climb in the Adirondacks, Berkshires, Alps, or Rockies there is up-hill and down-hill walking to be done, and this means a different sort of foot-work than that to which one is accustomed on level ground. Let me explain the energy-saving technique of walking up a fairly steep slope.

If you were to ask the average small boy (and not a few of his elders) to demonstrate the best method of mounting a slope, he would probably start off at top-notch speed and with each stride upward he would give a vigorous spring with the toes of the rear foot, or, in other words, *push* himself up the slope: a proceeding comparable in some respects to lifting yourself by your bootstraps. A great deal of spirit and foot-work, to be sure, but not much head-work. He is throwing stored-up energy

to the winds and playing havoc with the muscles of the calves of his legs.

A similar demonstration on the part of an experienced mountain climber shows a notable difference. In this case the whole body seems to be doing the walking. In place of high spirits we find even rhythm and leisurely restraint. The rear foot, instead of being pushed upward, is *pulled* upward. No one set of muscles is being overburdened; the work of climbing is being equitably distributed throughout the body. If the slope proves too steep for comfort while walking upward in a straight line, the course is changed to a zigzag route. Paradoxical as it may seem, the longest route to the top sometimes proves the shortest.

There is a slight swaying motion to the body of the experienced climber and his steps are fairly short. When he reaches level spots in the slope, his stride is lengthened a trifle but the speed is not appreciably increased. Always on both steep and level stretches he walks with the heel as well as the ball of the foot planted flat on the ground, even though it is necessary to place the foot sidewise to the slope in order to accomplish this. To mount a slope solely on the toes and balls of the feet, so that the heel is left suspended in air without support, means great waste of energy. This is commonly done by beginning climbers.

While climbing a slope, one now and again slips backward from stepping on loose stones, mud, or wet grass. The beginning mountaineer under such conditions is likely to resemble a horse in a treadmill; he makes frantic efforts to hold his balance and regain lost ground, but fails to think about lost energy. The seasoned climber, on the other hand, acts as the condition of the slope warrants. The loosening of a single small stone may sometimes start a dangerous rock-slide, and in such a case one must get off to one side in a hurry, out of harm's way. But as a general rule a slip is a wholly innocent proceeding; the experienced mountaineer amiably allows himself to slip without making any effort whatever to stop, and then when he has ceased slipping goes back again to his leisurely rhythmic climbing.

Expanses of loose small rocks or great boulders are likely to be encountered on occasional slopes, and these should be regarded with suspicion and trod with catlike caution. Small rocks should never be dislodged from their positions if one can possibly help it, and when stepping from one of the larger rocks to the next it is wise, as a rule, to plant the foot upon the sharp edges. The flat surface of a large rock may seem an inviting foothold, but it is not likely to be so certain as one of the edges.

In crossing a tilted expanse of great boulders it is far safer to step from one to the next than to walk on the ground. It would be foolhardy to walk between two boulders, for there is always the chance that the boulder above may break

FOLLOWING A ZIGZAG TRAIL IN THE VALLEY OF TEN PEAKS, CANADIAN ROCKIES

loose as the result of some slight jar. In stepping from one boulder to the next the climber must be constantly on his guard against a sprained ankle. Due to the uneven nature of the footing, such a possibility is rather greater in this particular variety of climbing than in most others. Alertness of eye in picking the right footholds and the thought in mind that you will sprain your ankle unless you are very cautious serve perhaps as the greatest safeguards against such an occurrence.

To return to ordinary, every-day slope climbing, with special reference to the

descent. The principles of descending a slope are somewhat different from those of mounting it. Just as in uphill climbing the natural gait is one of leisure, so on the downward course the natural gait is one of speed. But not too much speed, or one is likely to land in the lap of trouble; not a harum-scarum down-hill plunge in which the feet function more quickly than the eye. One should know every moment just where one's feet are stepping.

The best gait, except for fairly level stretches, is one which is more of a canter than a walk; the footprints are close

A PARTY ON THE PEAK OF MOUNT MADISON, WHITE MOUNTAINS

together in pairs, instead of being evenly separated as in ordinary walking. If one foot lands upon an insecure foothold, the other foot is close by to hold the ground and thus prevent a tumble. The legs function more like springs during the descent than they do in the ascent. The jar of one's descending body demands this. The knees should be bent, although not too much so. Springiness of legs lessens the chances of a sprained ankle, although one must always be on guard against this accident during the descent of a slope.

The most dangerous type of climbing is that of scaling a precipitous rock cliff. This variety of climbing should be taken by extremely easy and safe stages until one has acquired a workable knowledge of rockcraft. And rockcraft demands, among other things, the cautious paws of a cat, the sharp eye of an eagle, and the steady nerves of a mountain goat. If these attributes can be augmented by a fair knowledge of geology, so much the better. If one is climbing a mountain which is in a rapid state of disintegration, it is expedient to bear this fact in mind as one strainingly reaches for a far handhold or foothold. Likewise, one

must study the tilt of the rock strata. Strata which project upward furnish holds which the reverse lay of the rock does not.

The instructions of a Swiss guide with whom I climbed Mount Sir Donald, in the British Columbia Selkirks, go far toward summing up rockcraft in a few words. As we were about to tackle the sheer rock cliffs which towered above glaciers and snow he said:

"From now on we're going to be four-legged animals. Hands do as much work as feet. Test every new hand and foot hold before you trust it. Take your time. Go slow."

As indicative of the technique of rock climbing in general, I will briefly relate some of the methods which we used in scaling the tilted face of that stupendous mass of rock known as Mount Sir Donald. We left our alpenstocks behind at snow-line. These staffs, which are so necessary on snow slopes, are in rock work a far greater encumbrance than help. Our rope line slowly writhed up the face of rock, only one man moving at a time. I used the word "writhe" advisedly. Rockcraft demands a gradual shifting of one's weight when mounting

a sheer cliff. There is never a sudden spring, as in climbing a stairway.

Our hobnails underfoot, doggedly gripped inch-wide ledges, yet we were careful not to place too great an amount of confidence in these footholds alone. Three of one's four limbs should be constantly anchored to various nooks, ledges, and projections. Hands oftentimes become more important than feet. Every nook and projection in which we hoped to put our trust we first regarded with suspicion. In the majority of instances our suspicions proved to be ungrounded, for it so happens that Sir Donald is an especially substantial mass of rock. On a crumbling mountain our proportion of safe holds would not have been nearly so large. For the same reason, the danger from stone missiles dropping from above was lessened, although more than once there came a warning clatter which induced us to flatten ourselves against the face of rock until the reason for the clatter bounced off into space.

The descent was in some respects more difficult than the ascent; a quite different variety of descent, I can assure you, than the speedy canter which has been described in connection with the ordinary mountain slope. Eyes are located in one's head, but in descending a cliff you really need them more in the feet. Furthermore, while ascending one is almost constantly facing the gray rock so encouragingly close to one's eyes and does not give much thought to the dizzy drop below, whereas during the course of the descent one sees quite a bit of that dizzy drop and cannot wholly help thinking about it, however hard one may try to banish it from the mind.

It is at such a time that one who is inexperienced in the ways of rockcraft may be taken with that strange physical and mental confusion known as dizziness. Steady nerves play an important rôle in rockcraft. Before attempting a difficult rock climb one should make sure first that the nerves will stand the strain. And remember the first and last rule of this type of climbing, which is—never make even the slightest move in a hurry.

EVEN RAIN-WATER IS A GOOD DRINK AFTER THE HARD PULL UP MOUNT AMPERSAND, IN THE ADIRONACKS

THE BOOK TABLE

GOMBO

BY CARLETON BEALS

GOMBO is not the name of an elephant, a Siamese prince, or the latest breakfast food. It is a royal château of King Victor Emmanuel, of the house of Savoy, and is situated on the Ligurian seacoast near the mouth of the Arno River—a little gem of a retreat surrounded by four hundred square kilometers of pine and oak forests and plantation lands known as the Cascine Vecchie di San Rossore. The Cascine was founded by the Medici; the present buildings at Gombo were built for the pastime of the kings of Italy.

But far more significant: On July 8, 1822, Percy Bysshe Shelley, while crossing the Gulf of Spezzia from Leghorn for Lerici in the Don Juan, was drowned in a summer tempest directly opposite the gates of Gombo. Two weeks later his body was tossed up on the shore. The pockets of his coat were still bulging with a volume of Sophocles and Keats's last book of poems doubled back to the "Eve of St. Agnes." On August 16 the body was burned on the sands in the presence of friends: Leigh Hunt; Mary Godwin Shelley, his wife and author of "Frankenstein;" Lord Byron; and Edward John Trelawney, "who loved Shelley, traced out his corpse and snatched from the fire the Heart of Hearts."

Happening to be in Pisa on a hiking tour through Tuscany, I was able to visit Gombo one hundred years, to the very day, after the poet was drowned. The whole of the previous afternoon I wasted trying to secure a special permit to wander at will through the Cascine and out to the beach, but, whether such permits are not granted or whether I looked too seedy, I was unsuccessful.

So, on the hot morning of the 8th, I set out boldly, not with a Colt in my hip pocket, but armed with a small wad of lire, which in this modern age of over-touristed Italy are more potent than pen, sword, or the cross. Knapsack on my back, kodak at the hip, two sandwiches in an inside pocket of my shirt, staff in hand, I swung over the Arno by the Ponte Mezzo, down the long cool arcades of the Borgo Largo, through the vast Piazza Duomo with its tilted campanile, its gray Cathedral and Baptistery, its Campo Santo, out through the New Gate and along the Stradone delle Cascine—a straight white road flanked with poplar trees and sluggish irrigation ditches.

Carts creaked past loaded with pine cones and wood from the royal forests, high-bodied white oxen tugged patiently at great timbers, quivering thoroughbred horses were enjoying their morning outing. Here and there barefoot men crept warily along the canal-banks hunting for eels, or flung their flies for fish

smaller than the thumb, or wielded enormous nets fastened at the four corners to bamboo cross-sticks. A glorious walk under the spreading trees with vistas of open hay fields and the dark green of the forests beyond!

After four miles the road parted, flowing around a wire fence that inclosed the administration buildings of the vast royal estate. I turned rapidly to the right. But a warden wearing Puss-in-Boots buskins and a green feather in his gray hat intercepted me.

I gave him an ingenuous smile. "This, I presume, is the road to Gombo."

He picked me over with a hostile eye. "Ughuh. Let's see your *permesso*." Then he pointedly informed me my journey had come to an end.

"That's too bad," I said, mournfully. "I had set quite a store on walking through the Cascine." I added some comments about the beauty of the country, the picturesqueness of his costume, the kindness of Italians, and the loyalty of the King's servants, finding an excuse for lingering by taking an exposed film from my kodak.

"If you *should* go in," the warden speculated, rubbing his chin, "you couldn't take that kodak along."

I promptly handed it across, remarking that I felt quite safe in leaving it in his custody. He took it dubiously.

"But say, just *why* do you want to go to Gombo? *Perchè, perchè?*"

"Well, a poet was drowned there"—that was what I had meant to say, but in reality had stumbled upon one of those many confusing preterit and perfect tenses with which Italian abounds, so that my remark in reality was: "Well, a poet has just been drowned there."

"What!" With a hairy, sun-burned hand he promptly beckoned me inside the wire inclosure and locked the gate behind me. Telling me to wait "with patience," he leaped on a bicycle and pedaled furiously off toward the buildings. In a few minutes he pedaled furiously back.

Presently a fat paunch, bedecked with a massive gold chain, waddled around a turn in the path. The newcomer regarded me suspiciously and demanded:

"You say a man has died near Gombo?"

"Yes, a poet."

"How'd he get in?"

"He didn't. His boat capsized, and his body was thrown up on the shore."

"No *body* has never come this way—*mai, mai!*"

"It was burned on the sand—by friends."

The fat man exchanged a sharp glance with the warden. "Now look here," he went on, "what was the name of this here poet?"

"Shelley."

"*Scelli*. Italian, *davvero?*"

"No, English."

"*Ma!*" Relief relaxed his features.

He felt himself on firmer ground. Englishmen are always doing unusual things. "When did you say this happened?" he asked.

"July 8—"

"What! And his body already burned!"

"Excuse me; I meant July 8, 1822. A hundred years ago to-day."

The fat man wrinkled his brows painfully. Well, Englishmen were queer, poets were probably worse, and Americans were sons of Englishmen—it worked out quite syllogistically: A dead poet and a modern "nut" wanting to see where he had died. His fatness consulted volubly and passionately with the warden, using enough gestures to have appreciably reduced his weight had he held dumb-bells in his hands. I was to be allowed to proceed. The fat official waddled off mumbling. The warden gave me my final instructions.

"Mind now, don't take your coat off; that would be showing disrespect for his Majesty; and don't go wandering off the road—*sempre diretto diretto*. They won't let you past Gombo to the sea, but—well, have you anything to eat? You can't eat on the royal farms, you know."

He pawed painstakingly through my knapsack, meticulously examined an aluminum alcohol cooking outfit, then made me throw away small quantities of tea and sugar. I thanked my stars for the two sandwiches inside my shirt.

And so with the warden's final "*Capito, capito?*" (understand?) ringing in my ears, down the straight road I stepped through the King's four hundred square kilometers of plantation and forest.

No more shade trees arched overhead; the sun was now high and blazing hot, the dust eddying up from my feet acrid and choking. After a cautious glance back toward the group of administration buildings, I sacrificed respect for comfort by removing my coat.

On either side well-tended forests stretched for miles. At intervals an unseen cuckoo, that prince of European birds, would call to me; rabbits started up from the roadside; fat partridges whirled out of sight through the trees. The shady depths looked cool and inviting. But I set my face resolutely to the hot, white roadway that is a two-mile rule laid down between the administration buildings and Gombo.

At Gombo a pompous caretaker in shirt-sleeves—where was his respect for royalty?—came to the latticed fence. I peered curiously through at the queer, steep-roofed, gabled red and yellow buildings, and informed him gently that I had come to see Gombo. But Gombo was not to be seen under any circumstances!

"At least I may look at the sea?"

"The road ends here," he said, oddly

puffing out his cheeks at the corners of his lips.

I patiently explained that I had come all the way from America to gaze upon the sea at this particular spot—I avoided the subject of dead poets; that I had walked these many miles just for that purpose. I waxed eloquent—or at least he pitied me.

"But you can't leave this main road," he said, but more kindly. "Still, I suppose that if you kept close to the fence—not an inch away—it might not be construed as leaving the road; it might be construed that you were following the road if it did keep going."

He stuck his hand through the fence. I seized and shook it heartily. He licked his thick lips and gave me a hurt glance. So I shook his hand again, more genteelly, with less American gusto, and then—of course—I slipped a two-line note into his palm (not quite ten cents at present exchange rates). He beamed shingly, and I followed the road that was not a road.

"And, whatever you do," he called after me, "don't go in bathing. That is highly treasonable. All this coast is reserved for the King."

I thanked him again and continued along the fence, dodging around deserted concrete sentry-boxes until I came at last to the Ligurian Sea.

The greenest of green seas and a forlorn sandy shore—this is the outlook from Gombo. Save for the royal bathing pavilion, thatched and weatherbeaten, save for a rickety diving pier and three or four palm-leaf shooting blinds, the coast stretches for miles without a sign of human handiwork; only far south, at the mouth of the Arno, the village of Marina is a fleck of gold on the white sands. My gaze wandered out over the green, green sea to the tiny purple island of Gorgona, then, swinging about the palest of blue horizon circles, rested upon the hazy mountains beyond Lerici—that never-reached goal.

My mood changed—one of those quick shifts in the human feelings that transforms the whole aspect of the universe. The spirit of the lost poet hovered over the shore, investing it with pathos and solemnity. His impassioned and meteoric career flashed before my retrospection. The waves rose and broke with that same austere and relentless rhythm which cadences the last and sublime passage of "Prometheus:"

To suffer woes which hope thinks infinite;

To forgive wrongs darker than death or night;

To defy Power which seems omnipotent;

To love, and bear; to hope till hope creates

From its own wreck the thing it contemplates;

Neither to change, nor falter, nor repent;

This, like thy glory, Titan, is to be Good, great, and joyous, beautiful and free;

This is alone Life, Joy, Empire, and Victory!

And telling over these last lines, I was possessed by a burning urge to feel the sea against my chest, the same sea that had taken his life. I was sweating; I was parched with a thirst that the lukewarm water from my canteen would not allay. All the King's horses and all the

PERCY BYSSHE SHELLEY

From a crayon copy of Miss Curran's oil portrait in the Bodleian Library

King's men would have had to stand between me and those low diving Mediterranean breakers. Quicker than the telling, I was running into the surf; and a dashing wave broke in a dazzle of spray over my head, and a quick delicious chill shot through my body. Glorious—for a second.

But all the time I was thinking of Shelley; of the catastrophic blow with which nature had felled him as a lesson in real charity to those whose bigotry had helped to drive him into exile; of the momentary peace and relaxation, perhaps, with which he had set sail that clear, hot morning a hundred years ago. I thought of the mockery of that last ambitious and unfinished poem, "The Triumph of Life," for fate, it would seem, had determined to punish the audacity of his having seized upon such a theme. I thought of the story of Job which he was planning to put in metrical dress, and I wondered whether the Job he might have created would have been a greater soul even than Prometheus—a soul whose lofty patience would ultimately have shamed an unjust tribal god into righteousness; who would have hoped as did Prometheus until hope created from its own wreck the thing it contemplated; who would thus have achieved spiritual liberation, even as Shelley had done during those years when English public opinion was tearing at his vitals. I imagined the poet pondering over this great new poem, matching its rhythm with the pulse of the sea he was riding, a pulse which quickened to violent fury, and I visual-

ized his own life enacting the tragedy he might have written.

And suddenly the very salt of the sea seemed to carry the tang of his spilled blood, and the sea had grown more warm than the surrounding air. I was being bathed in something more than sea, and the surf beating on the shore seemed still to carry the echo of his dying cries. I ran naked up the shore, shaking the big drops from my body with something like fright. Panting, I lay down in the sun to dry.

All around the horizon the clouds were puffing up into the azure sky, but their stalks were black, like those of white mushrooms springing from mire. And almost in awe, I watched the gathering storm, wondering what poet—this hundred years later, when the world is once more a fury of hate and destruction—what poet, what great soul is, perchance, perishing to whom the world will some day pay its belated homage.

And my hand fell upon a heap of purple shells; white on the back, purple in the hollow, and where the purple melted into white their texture was like the skin of a beautiful woman—or a poet—beneath which delicate veins flowed with rich life. Were I living in a less practical-minded age, I might have imagined that the gods had willed that the shells on this coast be forever tinted with the blood that had pulsed from the great "*cor cordium*." Certainly the blood in the veins of Shelley was of royal purple, more royal than that of the kings of the House of Savoy who have usurped the shore where he died; for, though there are greater poets than Shelley, he, and perhaps he alone, stands with Dante in loftiness, purity, steadfastness of soul, unshaken honesty of purpose, and unflinching idealism.

And when I had dressed and tramped back around the road that was not a road and the road that was a road; when I finally redeemed my kodak, I gave the green-plumed warden two purple shells.

"These," I told him, "are worth more than all the lire ever printed by the Banca d'Italia, for they are tinted with the blood of a poet."

And now I know the perplexed fellow believes me mad. Purple shells! Purple shells and an afternoon filled with the glamour of departed greatness. Purple shells and dreams.

Florence, Italy.

THE NEW BOOKS

POETRY

BALLAD-MAKER'S PACK (A). By Arthur Guiterman. Harper & Brothers, New York. \$2.

If Arthur Guiterman's poetry was as perfect as his rhymes, he would be the finest poet in America. But, alas for Arthur Guiterman! it is not so. "A Ballad Maker's Pack," for instance, affords the reader a deal of dexterous matter in point of technique, but rarely ever is that unexplainable urge which

transmutes verse into authentic poetry to be discovered. His grace and spontaneity should be perceptible to all; his facility is undoubted. It is a fatal facility, however, and it would undoubtedly be better for the versifier if his stanzas did not come so easily. He writes about everything in the 260 pages of his book—sentimental verses, patriotic effusions, legends, peeps at other

lands, nature verse, anything the reader desires. The plethora is so great that it is impossible to give a fair estimate of the writer by quotation.

DRAMA

WHITEHEADED BOY (THE). By Lennox Robinson. G. P. Putnam's Sons, New York. \$1.75.

Those people who witnessed the production of Lennox Robinson's amusing

three-act comedy by the Irish Players last season will hardly need any comment relative to the play. "The White-headed Boy" is fairly representative of the contemporary manner of the Irish stage. No small part of its success is due to the mellow drollery of the dialogue, which is distinguished by a delightfully light touch. It sets off admirably the apt character.

THE MAIL BAG

BIRDS AS MONEY SAVERS

IN the issue of The Outlook for June 21 I read with interest "How Birds May Save a Billion Dollars' Worth of Foodstuffs a Year." As a lover and protector of bird life, I heartily agree with all Mr. Moulton says except his statement in regard to the bob-white. He says: "The policy of absolute protection recently adopted by one of the States is not called for by strictly economic considerations." Doubtless he refers to Ohio, and I want to say that with us it was a policy of absolute protection or extinction.

Ohio is a great industrial as well as agricultural State. Towns and cities are close together, and our farms are overrun by hunters and trespassers, many of whom hunt without permission of the landowner and assume that everything is free in the country. Can you imagine the feelings of a farmer who had found a little flock of frightened quail on his farm, petted and fed them through an ice-bound winter, only to have them ruthlessly exterminated during the open season the following fall? Persecuted as they were by dog and gun, the time came when they were rarely seen, except now and then one with a broken wing or a leg shot off that had escaped the hunter's bag to die of pain and starvation.

We farm folks know that the bob-white is our most faithful ally in our endless war on weeds and insect pests; we know too that bob-white never did a harmful thing in his life, and that the meat on his little breast would never pay for the ammunition and time required to kill him. Largely through the efforts of the Ohio State Grange, State Senator C. A. White of Lisbon, Ohio, and the farmers of the State generally, a law was finally enacted putting bob-white on the song-bird list, where he should be. A few years of protection and two open winters have increased his kind wonderfully. They step daintily and fearlessly about our premises now, even condescending to answer our rather inferior whistle, and we are proud of their friendly confidence.

Sportsmen and manufacturers of ammunition are making a desperate effort to get them back on the game-bird list. Some of their arguments might be amusing if they were not so maliciously false.

One is that the bird, being so very prolific, will soon become more numerous than the country can support. We reply that when they do will be time enough to begin the slaughter. Another is that, since they are no longer valued as game birds, they are becoming extinct through starvation and neglect; yet it is an undeniable fact that they are many times as numerous as they were when on the game list. Another is that unless the coveys are shot to pieces annually the species will deteriorate through inbreeding and eventually become extinct; and we are moved to inquire sarcastically how they think Mother Nature ever managed to run her business before they came on the scene with a shotgun.

If sportsmen want to do the country an economic favor, let them have an open season the year around for rabbits and red squirrels, for these two pests destroy billions of dollars' worth of foodstuffs annually and do no perceptible good. Or, if they must shoot birds, let them try their marksmanship on blue jays and English sparrows, whose vices outnumber their virtues and who do their utmost to drive out more desirable birds.

In winter droves of juncos, titmice,

chickadees, white-breasted nuthatches, five or six different varieties of woodpeckers, and a few cardinals come to the writer's home for feed. We hang suet and bones on trees about the house, and even on the back porch, where the smaller birds, especially chickadees, come quite fearlessly. A high shelf on the porch is kept supplied with crumbs, and some are scattered on the ground, for juncos prefer crumbs and will eat meat only as a last resort. An ear of easy-shelling corn is fastened on a window ledge for the cardinals, as this is the only place we have found where the jays, sensing our hostility, will not molest them. Evergreen trees afford a welcome shelter for all.

In the springtime horsehair, bits of string, cotton, and other nest-building material scattered about help to attract the migratory birds. A hollow behind our house, with a stream of spring water and scattered forest trees interspersed with cherry and mulberry, makes a paradise for more birds than I have time or space to mention here. All summer long they furnish us with exquisite music and protection for garden and orchards. It is well worth any one's while to cultivate the friendship of birds.

MARY CALDWELL.

Leetonia, Ohio.

COLONEL THOMPSON DEFENDS THE A. A. U. AND REPLIES TO "AMERICA'S BOSS-RIDDEN ATHLETICS"

IN The Outlook of April 19 you printed an article by Newton Fuessle, called "America's Boss-Ridden Athletics," and featured it on your title-page.

In this article Mr. Fuessle refers to the American Olympic Association as an arm of and a "subsidiary of the Amateur Athletic Union," and makes a series of grave charges against the A. A. U. By featuring Mr. Fuessle's article The Outlook indorses his charges, and as The Outlook passes into the libraries of the best element in the country, these charges, if unanswered, remain a continuing charge which must necessarily weaken the influence of the American Olympic Association, and therefore I ask you to publish the following statement.

The A. O. A. was organized to promote the Olympic Games—that is, inter-

national amateur sports—to encourage every American youth, not merely to better his muscular development, but to make the best possible body that the thews and sinews given him by God and his ancestors will permit; to elevate and broaden the standards by which athletes to compete in the games are chosen; and to kindle in their souls such a love and respect for the United States that the world will say, as Baron de Coubertin, creator and President of the International Olympic Committee, said of our 1912 team at Stockholm: "Until your teams are animated by the same patriotism which controls the representatives of the United States you cannot hope to compete with them."

If all the organizations that participated in the meeting of November 25,

1921, join the A. O. A., it will represent every sport association in the country—those that deal with men who may now compete in the Olympic Games, those interested in youth who in the future may compete, and great organizations like the golf and tennis associations not yet represented in the Olympic Games.

The A. O. A. will not be controlled by any group or faction; it will be a senate, the members of which are elected by independent organizations. There will be two parties in the A. O. A., just as there are in the United States two political parties—one that believes in States' rights, and one that believes in a strong Central Government; the one administered by volunteers trying to produce "individuals," the other trying to produce good classes; the one believing in unpaid management, the other in highly paid expert management. Both parties have good and evil in their composition, and both are animated by a strong desire to do good.

There is room for both in the American Olympic Association, and the associations that fail or refuse to join the A. O. A. will fail to do their full duty to the United States.

The A. O. A. has nothing to do with the management of National sports; it has everything to do with the international Olympic Games. It will control the "try-out games," prescribe standards for the competitors in those games from the winners in which the men who are to compete in the Olympic Games must be selected, take the team to the games, and see that they conduct themselves properly while there.

The A. O. A. will have enough to do without joining in any of our home disputes, which always have and always will occur, just as we will always have different political groups.

I am perfectly certain that on the next Olympic team we will have representatives of the Army and the Navy, of the colleges, and of the great athletic organizations of the country, working together in perfect harmony, maintaining the same high American standards as did the team of 1912, and securing even better results in the sports than did that historic team.

I hold no brief for the A. A. U., but that organization is a member of the A. O. A.; it always has taken, and probably always will take, a prominent part in Olympic Games; and in fairness to that organization I submit the following statement, the facts therein being within my own knowledge or obtained from official sources:

Mr. Fuessle says: "A self-appointed and self-perpetuating hierarchy of bosses absolutely controls America's representation at the Olympic Games." This statement is untrue.

For instance, on the 1912 team at Stockholm, riding was represented by five Army officers designated by Major-General Leonard Wood, then Chief of Staff of the Army. The Rifle Team represented the Rifle Association and included a Princeton professor, but was

mainly composed of officers and men of the Army and Navy, and was captained by the then Lieutenant-Commander (now Captain) Harris Laning.

The Fencing Team had on it officers of the Army and Navy, and it represented, and the men were chosen by, competitions held by the Amateur Fencers' League.

The Revolver and Shotgun Teams were chosen by and represented their own associations. The Army, represented by Colonel George Patten, contended in the pentathlon.

The track and field athletes, representing athletic associations from all parts of the country, contended at try-out games held in various parts of the country, and the winners at these games were the "Track and Field" athletes on the Olympic team. I can conceive of no fairer or better method of selection, and certainly no "self-appointed and self-perpetuating hierarchy of bosses" controlled America's representation on this team.

On the team were Army, 11; Navy, 4; undergraduates, 41; and representatives of various athletic and sport organizations, 112. The team of 1920 was selected while many of the young athletes of the country were still in the Army and Navy, and was composed of Army, 54; Navy, 37; undergraduates, 56; and athletic organizations, 200.

The team was sent to Antwerp on an Army transport, and had probably the same treatment and the same accommodations that our soldiers had. It is common knowledge that the world was not on a normal basis and that the comforts of 1912 could not be expected in 1920. Still, the team did wonders, secured 557 points, and our Fencing Team, captained by an Army officer, Major F. W. Honeycutt, won the third place over the strong British team. So much for the teams.

Now for the committees that managed them, described by Mr. Fuessle as "a small and arbitrary group." The American Olympic Committee that supervised the games of 1912 was organized in 1911 at a meeting of representatives of the National associations of the sports generally featured at the Olympic Games.

A large committee was selected, on which were representatives of every section of the country, and an Executive Committee on which were the three representatives of the International Olympic Committee: Professor William Sloan of Princeton, Allison V. Armour, and that fine gentleman and sportsman Everett Wendell, who, alas! is no longer with us. On that Committee were representatives of the Army and Navy, the Fencers' League, the Rifle and Revolver Associations, the Intercollegiate A. A. A. A., and the A. A. U.

After the 1920 games it was suggested that a permanent Olympic Association should be formed, and at a meeting held in New York on November 25, 1921, to organize an American Olympic Association, two proposed constitutions were submitted—one to form an American Olympic Association, and the other to

form a Federation of Athletic Associations. The meeting voted to adopt the first constitution, and the representatives of the Associations who favored the Federation withdrew, and declined to join the A. O. A. The trouble was largely due to a misunderstanding of Clause Six of Article III in the constitution as adopted. The Federation representatives believed that under this clause the A. A. U. would have absolute control, whereas the fact is that out of 127 votes the A. A. U. had only 35 votes.

The Executive Committee, which should be composed of men especially interested in athletics and qualified to represent America and the American spirit, will have on it, if the Federation and the Army and the Navy finally accept membership in the A. O. A., five men who are officers of the A. A. U., five who are officers of the Army and Navy and Federation, and five who are independent.

Of course it is true that no association can continue to exist if the members of the association are not willing to trust each other, but, from my knowledge of the men, I know that if once they know each other misunderstandings will disappear and the men will work together. The object which we will have at heart is to secure a proper representation of the United States in the Olympic Games, and to have our representation therein so managed as to secure the good will of our foreign competitors.

Mr. Fuessle describes the A. A. U. as "that powerful Amateur Athletic Union, whose strength has been steadily growing for sixty years," and then goes on to say: "The Amateur Athletic Union, known as the A. A. U., in no wise represents the vast number of institutions and organizations from which our athletic strength is recruited."

The A. A. U. is composed of twenty organized districts, representing nearly nineteen hundred organizations, each one of which manages its own games with entire independence, employing the machinery of the A. A. U. only when the games are open. The A. A. U. then steps in to insure that professionals posing as amateurs do not intrude into the games.

One of these A. A. U. district associations, for example, the Metropolitan Association, has in its membership the American Legion of "New York State Department," representing 100,000 members; the Public Schools Athletic League of New York, representing 200,000; the Bankers' Athletic League, composed of thirty-six banks in New York City, representing 15,000; the Municipal Athletic Activities Association of New York, which promotes athletic activities for the employees of the city, representing about 80,000; the Scandinavian-American Athletic League, composed of Swedish, Finnish, Norwegian and other Scandinavian clubs; the Sunday Schools Athletic League; the Western Union Athletic Association; the Amateur Industrial Athletic Association; the Industrial Athletic Association of New Brunswick; the Newark Insurance and Banking Ath-

letic League; the Y. M. C. A.s of New York, including all the Y. M. C. A.s in the greater city; the Y. M. C. A.s of New Jersey, including all the Y. M. C. A.s in the State of New Jersey north of Trenton.

The Association also included Columbia University, Princeton University, the College of the City of New York, Fordham University, New York University, Rutgers College, Brooklyn College Club, and Cooper Union Night School. There are also the Knights of Columbus councils, Elks' clubs, settlement houses, Young Men's Hebrew Associations, Turn Vereins, all the National Guard Regiments in Greater New York, the Hotel employees' organizations, etc.

Altogether there are 187 independent organizations belonging to the Metropolitan Association. Mr. Fuessle states that the A. A. U. is a clannish organization composed of local and powerful athletic clubs. But the list named above certainly does not bear out his statement.

It is true that the New York Athletic Club and several other clubs are in the Metropolitan District and are members thereof. It is also true that the New York Athletic Club has exactly the same vote as has each unit of the Y. M. C. A. or the Sunday School League.

The New York Athletic Club was organized in 1868 by young men who fought from '61 to '65, and in the more than fifty years of its existence it has constantly worked to promote amateur athletics. I am proud of the fact that I have been twice the President of that club.

I assure you, Mr. Editor, that the way to build up athletics is not by trying to destroy an organization which, as Mr. Fuessle says, "has been growing stronger for sixty years;" and which represents over two million members, each one of whom has an opportunity at the proper time and place to vote for representatives, who in turn select the officials who manage the A. A. U.

In conclusion, let me remind you and let me remind the public that 1924 will soon be here, and that in the meantime we have got to take the necessary steps to provide a team for the Olympic Games of that year. We will provide it and it will be a good one; and let me prophesy that the Army and the Navy and the colleges will take part in selecting and managing that team.

ROBERT M. THOMPSON,
President American Olympic Association

[Colonel Robert M. Thompson, President of the American Olympic Association, replies here to an article based largely on an interview with General Palmer E. Pierce, President of the National Collegiate Athletic Association. The Outlook is of course in sympathy with the principles for which General Pierce stands.]

It appears that if all organizations invited to join the American Olympic Association do so, 64 votes will control any meeting. And if, as stated by Colonel Thompson, the Amateur Athletic

Union has 35 votes, it is seen that this number is more than half the 64 votes required for a quorum. The result of this voting power is shown by the election of officers on November 25, 1921. The president, three vice-presidents, secretary, and auditor elected on that date by the American Olympic Association were all either officers or prominent members of the Amateur Athletic Union.

Colonel Thompson's defense indicates apparent tentative changes in the constitution of the American Olympic Association, which to some observers reflects

the arbitrary control of the A. A. U. and makes many organizations fearful of joining.

Finally, college-trained members of American Olympic teams since 1896 have been responsible for approximately seventy per cent of the successes achieved at the games by American representatives. It seems desirable that the trainers of these men should have appropriate representation in the conduct of the affairs of the American Olympic Association, which, it appears, has been denied to them.—THE EDITORS.]

More of the BEAUTIFUL INFORMAL ENGLISH in

UNPUBLISHED LETTERS *of* EDWARD FITZGERALD

The Translator of OMAR KHAYYAM

to BERNARD BARTON, *the Quaker Poet*

It is twenty years since the last collection of FitzGerald's letters was published, and it seemed unlikely that any more would be forthcoming. Recently, however, through one of Barton's kinsmen, a lot of letters from FitzGerald to the Quaker Poet, written in the late thirties and forties, have been found, and Scribner's Magazine is privileged to print two articles from that correspondence. Here will be found the beautiful informal English for which FitzGerald is famous. The poet, Barton, and he had a bond in common—both were ardent collectors of pictures—and these letters are full of the eager quest for drawings and pictures at very moderate prices, for neither had much money to spend. The letters, which you will read in Scribner's Magazine, are also filled with allusions to FitzGerald's literary friends—Tennyson, Carlyle, Trench, Milnes, and other great Victorians. These letters are a real find. Get your copy of

An Unusual Service for Outlook Readers

You are frequently in need of a household helper, companion, nurse, governess, teacher, or business or professional assistant. Or perhaps you are in search of such a position yourself.

In either case, an Outlook "Want Ad" will undoubtedly solve the problem. Here is a typical extract from a letter just received—"I had not anticipated that my ad would prove so alluring. I received twenty-four replies and they came from thirteen different States. It has given me a great respect for the wide circulation of The Outlook."

Try a "Want Ad."

The rate is only Ten Cents a Word.

BY THE WAY

A Child's Reading

DO you realize the tremendous importance of selecting books for young people which will not only entertain but will help to *mould character* as well? Such books are the famous animal classics, *Black Beauty* and *BEAUTIFUL JOE*, stories which have never failed to hold the children's attention to the very end. They read and love the story of *BEAUTIFUL JOE*, the homely and abused little dog who was rescued and adopted by a sympathetic family. And they read it without realizing for a moment that they are absorbing one of the greatest lessons a child can learn—the lesson of *unselfishness*.

More than a million copies of
BEAUTIFUL JOE have been sold

A story that will never grow old, and one that speaks not for the dog alone, but for the whole animal kingdom. Through it we enter the animal world, and are made to see as animals see, and to feel as animals feel.

BEAUTIFUL JOE

By Marshall Saunders

has just been revised and re-issued in handsome cloth binding, with colored picture-cover, many illustrations, and charming end papers by Charles Copeland. Don't wait for Xmas to help your child develop the qualities needing development *now*. Every bookstore has it or can get it for you. \$1.50.

Samples of *ten* different patterns and finish, sent on receipt of *10 cents*, including a thirty-two-page booklet on handwriting.

SPENCERIAN PEN COMPANY
349 Broadway, New York

A CORRESPONDENT seeks to put you straight as to the name of the horse of the famous ride from Winchester to Cedar Creek," a subscriber writes, "and quotes from Sheridan's 'Memoirs' to sustain his claim. But he gives too much weight to Sheridan's words in the 'Memoirs,' for Sheridan does not there say that the horse *always continued to be called 'Rienzi.'* In Hinton and Burr's *Life of Sheridan*, on page 214, there is an allusion to 'Rienzi, or Winchester as he was called by the General after the battle at that place,' etc. On October 17, 1881, Sheridan wrote to Colonel Herbert E. Hill from Chicago, and, speaking of the ride, says: 'My black horse Winchester was saddled,' etc., and later in the same letter says, 'I rode my black horse Winchester,' etc. On the following day the General wrote again to Colonel Hill saying: 'The black horse Winchester died October 2, 1878,' etc. These two letters are set forth in Hinton's *Life of Sheridan*, page 212."

"I am built just as other people are built, so far as I can discover," says Mark Twain in "Unpublished Chapters from an Autobiography" in "Harper's Magazine," "and therefore I do prize a good hearty compliment above rubies. But when a man goes beyond compliment, it makes me ashamed. . . . Adulation. Adulation—spoken or hinted. And never earned; never due, to any human being. What a king must suffer! For he knows, deep down in his heart, that he is a poor, cheap, wormy thing like the rest of us."

Prohibition agents who found a still in full operation in a tenement in New York City were regaled with an ingenious explanation by the owner. "I was in an elevator accident once," he explained, "and ever since then I have had to take alcohol baths. Sometimes I get more alcohol from this still than I need for my bath, and that I make into wine for occasional internal use to help me get back my health." Notwithstanding this pathetic plea, the owner was locked up and his still confiscated.

A New England library contains a file of the "Providence Gazette" for 1783. The advertisements occupy an inconspicuous place and are couched in a much humbler style than the appeals of our day. Here are two characteristic examples:

Samuel Coy, Painter, begs leave to inform the Public, that he continues to carry on his Business, in every branch, and is ready to serve his Customers and others at the shortest Notice. He has for Sale, Colours and Putty as usual.—The smallest Favours will be gratefully acknowledged.

N. B. He will take any Kind of Country Produce in Pay. At present he is in Want of Stone-Lime, House-Plank, Joist, Yellow Pine Boards, and some other Materials for Building, which will be received in Lieu of

Cash, provided they be delivered this Winter.

To be sold by Olney Winsor, at his Shop, a few Doors Northward of Dr. Arnold's Hay-Scales, a neat and well-bound American Edition of the Holy Bible, Printed by Mr. Robert Aitken, in Philadelphia, and examined, approved and recommended by Congress. As this is the first Edition ever published in our language in this Country, it is presumed that the Curious, as well as the Religious, will wish to be possessed of a copy. They will apply soon, as but few are on Hand.

The "London letter" which is a front-page feature of an issue of the "Providence Gazette" in 1783 contains these items of contemporaneous interest to our forefathers:

The Americans have made a demand for several hundred thousand pounds, principally for the subsistence of the prisoners taken at Saratoga.

Anecdote: A few nights since, a celebrated Duke, after supping with the Prince of Wales, and drinking rather freely, gave for a toast, "a speedy coronation!" This intended compliment however failed in its effect; for his Royal Highness, with a proper spirit of indignation, filled a bumper and threw it into the Duke's face. The offender, struck with the impropriety of his own conduct, thought the best way was to put it off with a laugh, and filled his own glass and dashed the contents thereof in the face of —, who sat next to him, saying, "His Royal Highness hath given us a new fashioned sentiment in preference to my toast, so pray put it round."

On Monday the 2d inst. died at his apartments, No. 12, Cockspur-street, Mr. Burne, the Irish giant, in the 23rd year of his age. His remains are secured in his coffin which measures upwards of 8 feet 4 inches: His friends are determined to have him carried to Ireland in a few days. All persons desirous of seeing the above coffin, will be admitted this day, at 2s. 6d. each.

The August Bulletin of the American Relief Administration contains this cheerful announcement:

"The Russian people have been snatched from the brink of a catastrophe unequalled in the history of the world's disasters. The generosity of the American people . . . has accomplished the almost impossible. For the last sixty days no one has starved in Russia: the number of deaths from starvation which six months ago threatened to extend into the millions has been limited to a number which certainly will not exceed half a million, if that many. To-day almost ten million destitute people subsist on American foodstuffs bought with American money, transported across the ocean in American ships, and distributed by an inconceivably small group of American personnel."

SHALL WE FORGET THE LUSITANIA?

"THE QUESTION IS WHETHER THE CLAIMS OF KILLED AND INJURED AMERICANS SHOULD BE RELINQUISHED TO HELP SATISFY GERMANY'S EUROPEAN CREDITORS." SAMUEL FLAGG BEMIS DISCUSSES THE PROPOSAL TO RETURN ALL ALIEN PROPERTY TO ITS FORMER GERMAN, AUSTRIAN, AND HUNGARIAN OWNERS

The Outlook in Schools and Colleges

BOARD OF EDUCATION
THE CITY OF NEW YORK
THE BOARD OF SUPERINTENDENTS
Park Avenue and Fifty-Ninth Street

I congratulate you on the frequency with which I see *The Outlook* used as a text-book in the schools and on the interest and vivacity of the recitations in which it is used. I do not know of any single subject of more vital importance to the coming citizen than the study of actual National problems which will confront the voter when he reaches his majority. A clean, concise consideration of these questions such as is presented by *The Outlook* every week without "writing down" to the supposed lower intelligence of the school makes a highly desirable text.

WM. MCANDREW,
Associate Superintendent, Public Schools,
New York City.

June 27, 1922.

"SUGGESTIONS FOR USING THE OUTLOOK IN THE TEACHING OF CURRENT HISTORY, CIVICS, ENGLISH AND RHETORIC"

—is the title of a pamphlet giving a complete outline of suggestions for the use of *The Outlook* in class-room work which will be mailed free of charge to any instructor or teacher in the United States. The Outlook's special class-room rates are also enclosed and explained in this pamphlet. There is no charge and there is no obligation—simply drop a line of inquiry to

Making New Markets With Printer's Ink

ONE of the most striking changes of the past ten years is that which has come about in the important business of housekeeping. In this short time the broom and the washboard have vanished from the housewife's coat of arms, and the comic pictures in which Mary hurls the flatiron at John don't ring true, as they once did.

Broom, washboard and flatiron have given away to suction sweeper, electric washing machine and electric iron. And Mary doesn't hurl the iron at John any longer, not simply because it's fastened to a cord, but because she's taking no chances with it.

What has brought about this new and agreeable state of affairs? Well, how did Mary happen to buy that new iron which has proved such a boon to herself—and John? She saw it advertised, of course. And the multiplied Marys of today represent a great market created largely through national advertising.

No wonder the alert retailer and the wholesaler have come to hold national advertising in high esteem—for besides making easier for them the sale of goods with long-established markets, quickening their turnover, protecting them against in-

ferior merchandise and benefiting them in many other ways, national advertising is constantly creating markets for new merchandise and opening up new channels of trade.

It is because America reads advertising that the new idea today so swiftly supplants the old. Advertising changes deep-rooted habits. Advertising creates new desires. Advertising sets new and better standards. And all this it does with amazing swiftness—for advertising speaks to millions simultaneously.

The safety razor, the player piano, massage cream, the glass baking dish, wallboard, fireproof roofing, the talking machine, soap flakes, canned soup—one could go on indefinitely extending the list of products which today testify to the ability of national advertising to create new merchandise demands.

There is probably no industry today for which advertising has not blazed new trails. There is no merchant, wholesale or retail, the scope of whose business it has not greatly widened.

* * *

But the main thing which advertising does for the retailer is to speed up his turnover; that's what makes him a profit.

[Published by The Outlook in co-operation with
The American Association of Advertising Agencies]

A black and white fashion illustration of a woman standing, wearing a light-colored, short-sleeved dress with a wide collar and a dark skirt. She has her arms crossed and is looking down. The background is dark and textured.

In such emergencies Absorbine, Jr. affords prompt relief. It is an antiphlogistic and stops inflammation and soreness. It is cooling, soothing and healing.

After sudden and long-continued exercise, the prompt application of Absorbine, Jr. to the parts affected prevents that next-day stiffness, lameness or soreness, so commonly experienced by persons unused to exertion.

A rubdown with diluted Absorbine, Jr. affords a delightful sensation. Athletes and trainers use and highly recommend Absorbine, Jr.

Diluted Absorbine, Jr. is also an excellent mouth wash, gargle and spray. It leaves the mouth refreshingly clean, removes disagreeable tastes and breaths, destroys crevice hidden germs and alleviates conditions of sore throat.

In one convenient container you have both an antiseptic and a germicidal liniment. It is safe, of a clean, pleasant odor and without the usual liniment stain; especially desirable characteristics where there are children about.

*At most druggists, \$1.25, or postpaid.
Liberat trial bottle, 10c. postpaid.*
